Persons who do not use mouth-filling oaths, get relief from painful stress by using what appear to be innocent terms unaware of the fact that many of the words used are corruptions and disguised forms of regular cuss-words. "For the Land's Sake" is a harmless ejaculation but it invokes a sacred place—the Holy Land. It is inherited from the time when crusades were waged for sacred places. "Gad," "Gosh," and "Gol" are obviously euphemistic forms of saying "God," as is "Deuce," a derivation of the Latin "Deus." "Law" is a corruption of "Lord." "Darn," "Durn" and "Dang" are used by people too reverent and refined to say the real word implied. Even words like "Goodness," "Gracious," and "Mercy" are originally sacred, religious terms and were once ejaculatory prayers.

How is the most useless sort of profanity, the verbal filler, the casual swearing of ordinary conversation to be explained? Professor Patrick's thesis is that modern life is too artificial, confining and repressing for human beings so narrowly removed in point of time from savage life and that escape from the inhibitions must be sought and the primitive conditions approximated. Relaxation is found in drink, play, sport and laughter. Profanity is also considered to be a form of relaxation because it gives relief from repression. Vulgar language, disgusting phrases and revolting allusions serve the same purpose among the lower social elements as profanity and may, therefore, be classified in the same category. We laugh at a portly, silk-hatted man who stubs his toe because there is a momentary escape from excessive propriety. Improper phrases give a similar sort of satisfaction. Expressions which are nauseating to a sensitive and refined person give to grosser individuals a sort of mental catharsis. They take them back to the spontaneous and unrestrained conditions of animal life and savage freedom and give a momentary relief from the restrictions of civilization by offering the satisfactions of a brief return to a more untrammeled existence. Profanity is, therefore, seen as a lapse into savagery and offers the same enjoyment to men smothered by an atmosphere of culture and refinement as the restless urchin experiences when he takes off the starched blouse which he wore to Sunday school and goes out to play in the dirt.

Briefly Told

On June 21, the inky-black bottom of a fourteen-hundred-foot mine at Sombrerete, Mexico is suddenly flooded with sunlight. It is an annual event as the mine is on the line of the Tropic of Cancer, and at noon of each June 21, the sun is vertically above the excavation and lights up the shaft to the bottom.

The entire town of Nicola, British Columbia—courthouse, post office, stores and residences—was purchased by a South African capitalist who intends to convert it into a model English village. A village green will replace the business section and model farms will be laid out on the twenty thousand acres surrounding the town.

The "Iron Hindenburg," a great wooden statue of the German field marshal, is offered for sale as firewood. It was erected with the idea of covering it with a coating of nails. A small charge was made for war charities for the privilege of driving each nail.

A .50-caliber machine gun has been developed by the United States Army, capable of firing a bullet which, at 200 yards, will penetrate one-inch armor plate.

Transmission, publication or circulation of information concerning the odds on horse races, or the betting on horses in any race in the state of Louisiana, is forbidden in a clause of the new state constitution.

Telegraph service in the interior of Argentina is frequently interrupted as a result of weaver spiders whose long silken lines cause short circuits when they cross the wires.

Because of a shortage of spaghetti in his homeland, Enrico Caruso laid in a large supply prior to his sailing for Italy.

France plans to transfer twenty-five thousand houses from Germany to the devastated regions.

More than three millions of Americans of prerevolutionary stock live in the Ozarks and the Appalachian Highlands.

The battle of the Little Big Horn is to be reenacted on the forty-fifth anniversary of the Custer Massacre, June 25, with United States cavalrymen and members of the American Legion taking the part of General Custer's ill-fated forces and Cheyenne and Crow Indians representing the attacking Sioux.

Housewives of Berlin are boycotting the Fruit Growers' Union which has fixed the price of cherries at eight marks a pound.

A biological expedition recently sailed from New York to South America to explore the headwaters of the Amazon and seek Theodore Roosevelt's famous "river of doubt." Special search will be made for rare herbs and plants desired by chemists and the medical profession. It is expected the expedition will be away at least two years.

King George has entered his racing yacht in thirty British regattas this summer. On July 16 and 18, the royal yacht Britannia will race Sir Thomas Lipton's Shamrock at the Harwich regatta. The Britannia will not participate in any foreign regattas.

A former sailor and lumberjack, a student of the University of Washington in the engineering department of the Federal board of vocational training, has established a new record in the army's "alpha" intelligence test, with a perfect score of 212 points in 13 minutes. The best previous score was 207 points in 17 minutes, made by a Yale professor.

As a result of a terrific hail storm which recently swept a section of Colorado, many wild ducks, unable to battle against the high wind and the hail, broke their wings, causing them to fall helpless to the earth. In the vicinity of Crestone fully one hundred plump ducks were obtained.

Prehistoric ruins of what is believed to have been a different race of cliff dwellers from those who inhabited the ruins in the Mesa Verde national parks have been discovered in an almost inaccessible region north of the Navajo Mountains in Colorado. The discoverer believes he was the first white man to view the ruins, many of which are larger and better preserved than those in the Mesa Verde national park.

Girls who plan on entering the fashionable Wellesley college preparatory school, Dana Hall, must pledge themselves to wear evening gowns with long sleeves and dresses reaching to the ankles, according to new rules recently issued.

France's share of the two million dollars bequeathed to France and Belgium by a citizen of Grove City, Pennsylvania, is to be used in caring for sick children in the war-devastated regions.

Germany's casualties in the World War are placed at 6,888,982 by the commander of the American medical corps.

To soothe the Harvard undergraduate who is nervous over the approaching examinations, music in ten-minute doses is to be provided each morning in the university chapel. The choirmaster has made the announcement that a program of light classical selections is to be offered.

Alan Seeger Chosen as Type for Memorial to American Volunteers

By ADRIENNE RICHARD

Paris, May 15—(By Mail.)

IT HAS been said on high authority that no poem written during the war attained greater reputation or touched a greater number of hearts than "I Have a Rendezvous With Death." Perhaps no other single figure so fitly symbolizes the spirit of high adventure in which the youth of America touched souls with the youth of France in the tremendous world struggle which these brave boys felt in their heart of hearts to be the high summons of chivalric duty, whatever scheming sordidness of politicians pulled the unseen strings. Of Alan Seeger, the young American member of France's Foreign Legion who fell in the attack on Belloy-en-Santerre on July 4, 1916, at the age of 28, the distinguished English critic, William Archer, says: "Of all the poets who have died young, none had so beautiful a death. One cannot help thinking of the group of English poets who departed in the flower of their manhood in the past hundred years: Keats exhaling his soul in a fit of coughing near the stairway of the Trinity of the Mount; the flaming spirit of Shelley extinguished by a blast of wind from the hills of Carrara; Byron poisoned by a fly's bite at the very beginning of his great adventure. For all these one cannot help feeling a regret which nothing can dissipate. Alan Seeger, on the contrary, we may truly envy. Youth had given him all that it could give . . . . And in the plenitude of his triumphal strength, his eyes brilliant, his pulse vigorous, he met the death which he had voluntarily chosen in the cause of the country which he loved and in the moment of victory. Over and over again, he had said in prose and in verse that such a death seemed to him beautiful. And two years of endurance without complaint of privations freely accepted, and of constant danger, proved that he said only what he really thought. Without pretending to measure Seeger with Shelley, Byron or Keats—although I think that none of these would have disdained his lyrical gift—I am certain that he was assuredly of their line, not only because of his premature death, but also for his entire devotion of heart to the romantic spirit. From his infancy, his one passion was Beauty, and it was under the form of Romance that she revealed herself to him. He was resolved from the start not only to write but to live romance; and when fatality threw in his way an historic occasion he seized it with delight. He knew that he played with death, but that was the very essence of his ideal."

Sculptor's first rough clay model of memorial statue to American Volunteers by Jean Boucher, which will probably find place in the Champs Elysees. The face of Alan Seeger symbolically furnishes the leit motif of the work.

The ardent and generous emotion that swayed this gallant young American and so many of his comrades is well suggested in his own lines: in the Memorial Day Ode read before the statue of Washington and Lafayette in Paris on May 30, 1916:

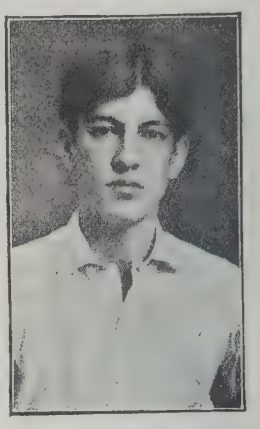
Now heaven be praised
That in the hour that most imperilled her,
Menaced her liberty who foremost raised
Europe's bright flag of freedom, some there were
Who, not unmindful of the antique debt,
Came back the generous path of Lafayette;

* * * * *

And where the forlorn, the gallant charge expires,
Where the slain bugler has long ceased to sound,
And on the tangled wires
The last wild rally staggers, crumbles, stops,
Withered beneath the shrapnel's iron showers:
Now heaven be thanked, we gave a few brave drops;
Now heaven be thanked, a few brave drops were ours.

Such thoughts as these recurred to me yesterday when, accepting an invitation from the sculptor, Jean Bouchér, I had the privilege of a first private view at his studio of the model, or rather the *esquisse* (rough sketch), as he insists on calling it, of the memorial of the American Volunteers in the Great War which he has just completed. Suggested months ago by a group of Paris litterateurs, the idea has been enthusiastically taken up of erecting in Paris a lasting and fitting memorial that should in a special manner mark French appreciation of the fine spirit of those heroic young Americans who so spontaneously enlisted in the service of France immediately on the outbreak of the war, intuitively recognizing the French cause in that early hour to be the cause of America also—the cause of Human Freedom. Few of us here will forget the memorable day in August, 1914, when several hundred young Americans, students, painters, writers and newspaper men who had been living in Paris, marched through the streets to the War Office to offer themselves to France. Without renouncing their own nationality, yet loving France enough to make her cause their own and feeling under a moral obligation to put their breasts between France and destruction, they asked the privilege of serving in any capacity. Most of them were at first assigned to the Foreign Legion, whence later a number went to man the essential services in which it was felt that their intelligence and their youthful enthusiasm would count most. First there was the American Ambulance Service, organized at the outset of the war by Richard Norton when ten auto chassis were secured, their bodies made with packing cases and offered to the French Government. From this small beginning, the corps grew within two years to eight sections of 25 cars each with a group of hospitals near Paris. Then came the organization of the famous flying corps, the Escadrille de Lafayette, also composed of young Americans. Before the United States officially came into the war, the names of a number of these Americans were, like that of Seeger, immortalized by their heroic deaths in action. "Comrades of the Stars" he had apostrophized them. Readers will instantly recall the profound influence created at the time on the minds of thinking people in Europe and America by the news of the fall of Victor Chapman, Norman Prince, James McConnell, Richard N. Hall, of Ann Arbor, Michigan; Dilwyn Starr, Kiffin Rockwell, Kenneth Weeks and Henry Harnsworth are other names among these brave youngsters whose memory France will long keep green.

Not a man of them but would agree, could he speak to us from the Valhalla of Happy Warriors, that all for which they stood is well summed up and symboled in the soul of Alan Seeger. It was with quick response to this inspiration that I noted in M. Bouchér's model that the vitalizing feature of his strikingly chaste and spiritual design was the head of the young American poet-warrior. The happy thought is one that might well be looked for from the French artistic genius, which goes instinctively to the inner sources of ideas that count.



I ventured some remark to this effect after we had stood together in silent contemplation of the model for a few moments.

"Ah," exclaimed the sculptor, "I have thrown myself with all my ardor, with all my love for the beautiful into this work! From the moment the commission came to me, I have been inspired by thought of the young poet, Alan Seeger, whom it was my good fortune to know and love. It was inevitable that I should, in seeking to express the essential qualities of the spirit of these young American volunteers in the first dark and terrible days of the Great War—the qualities that so entirely command the veneration of the French people—reproduce as symbol of the central altar fire of France's memorial the head and the features of the author of 'I Have a Rendezvous With Death.' And, dear friend, I have a strong impression, that as time goes on both France and America will take from this modest reminder of the days that tried men's souls as they were never tried before, some suggestion of the grand truth that in nobility of these devoted sons shone the true soul of America: that eternal love for Liberty in which the two great republics must ever meet as sisters, children of a common mother."

ALAN SEEGER
In the War Uniform of the Foreign Legion

Only a few hours before my visit, the committee charged with the organization and carrying out of the memorial project had conferred with M. Bouchér at the studio in regard to it. All had expressed fullest satisfaction with his conception as embodied in the clay model which he insists on regarding as merely a rough sketch. But he assured them that he preferred that the matter of the final shape of the work should be kept open and exacted a promise that the independence of the artist in such matters should be strictly regarded and that he should have fullest liberty to make such changes as may seem to him best in developing his conception. In fact, it was only on my promise to keep this proviso before the readers of THE DEARBORN INDEPENDENT that he consented to give me the accompanying photograph.

ALAN SEEGER
Student, Poet and Soldier of the Legion.

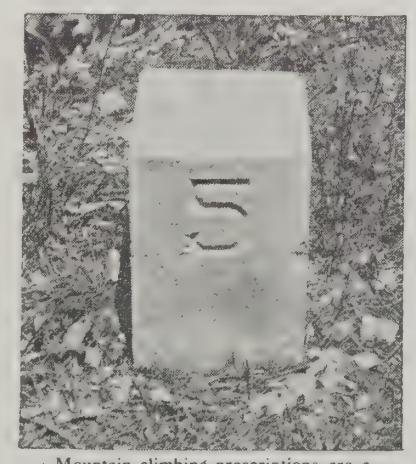
It is my belief, however, that M. Bouchér has so happily hit off the most fitting form for the idea his work is meant to express that the finished work will show no substantial departure from the *esquisse* pictured here. From a purely literary point of view, it is likely that in the critic's estimation, more than one other of Seeger's poems will outrank, "I Have a Rendezvous With Death"; but in the heart of the great majority of readers these are undoubtedly the lines by which he will be longest remembered. The poem breathes something of the vastness of view of Walt Whitman's "Heavenly Whispers of Death." Like Whitman, too, Seeger's fearless welcome of death went hand in hand with a sensuousness of nature fully alive to the joys of earthly beauty and the pleasures of this world, to which, however, he would not allow himself to be enslaved.

As to the thought that was his dominating inspiration, it has been said that Alan Seeger was not of our twentieth century, but rather an Elizabethan by nature. This verdict savors too much of the pedantic notion that we must always go back to the past for examples of high idealism and the lofty blend of courage and gayety of the old soldiers of fortune. Be that as it may, it is not without significance that the first of Seeger's sonnets is dedicated to that fine flower of English chivalry, Sir Philip Sidney:

Sidney, in whom the heyday of romance
Came to its precious and most perfect flower,
Whether you tourneyed with victorious lance
Or brought sweet roundelays to Stella's bower,
I give myself some credit for the way
I have kept clean of what enslaves and lowers,
Shunned the ideals of our present day,
And studied those that were esteemed in yours;
For, turning from the mob that buys Success
By sacrificing all Life's better part,
Down the free roads of human happiness
I frolicked, poor of purse but light of heart,
And lived in strict devotion all along
To my three idols—Love and Arms and Song.

1. The city of Hot Springs is hardly more than a great number of winding streets that weave in and out among the Ozarks. 2. "Bathhouse Row" in Hot Springs. Some of the most elaborate bathhouses in the world are located here.

Our Oldest National Park



Hot Springs Reservation, in Arkansas Ozarks, One of Our Smallest Parks, Tempts Tourists in Search of Health and Picturesque Wilds—Vistas of Woodland and Mountains, Including a National Forest of More Than 640,000 Acres.

THE oldest and almost the smallest of our national parks is located in one of the least known of our states. In fact, this one and a half square miles, comprising the Hot Springs National Park in Arkansas, and very fortunately controlled by Uncle Sam, outranks any similar resort in the United States, and in the world for that matter. I have this from Dr. William P. Parks, the government superintendent, and it is just another reason why there is no particular argument for spending vacations in Europe. Today this park attracts 150,000 visitors yearly, most of whom come to make use of the radio-active waters which pour from the mountainside at the rate of nearly a million gallons a day.

The drive uptown from the railroad station is a never forgotten sight. For nearly a solid two blocks there are nothing but bathhouses, some modest and others more luxurious. In fact, Hot Springs is hardly more than a great number of winding streets that weave in and out among the Ozarks, the business blocks and houses jutting up against the hillsides. In normal times it has a population of approximately 16,000, but when the winter visitors begin their pilgrimages, the number is doubled.

For nearly a full century, forty years before Yellowstone was made a national park, Hot Springs has been a government reservation. A few months ago Congress officially declared it a national park, although it had always been classified as such. It is believed that the hot springs were visited by De Soto in 1541, and there is a tale that the Indian tribes battled for control of the waters, but finally declared a truce. As early as 1800 people resorted to the springs in hope of regaining their health.

So in 1832 Congress set aside the hot springs and mountains surrounding them, making the first national park reservation in the country, and preventing the commercial exploitation of the springs. The park today includes Hot Springs Mountain, North Mountain, West Mountain, Sugar Loaf Mountain and Whittington Lake Park. All of these lofty hills, except Sugar Loaf, are now connected with modern automobile roads, a development of the last couple of years. From a lofty tower on the top of Hot Springs Mountain land in Oklahoma may be seen. Nearly every foot on these mountain roads brings to view new vistas of woodland and mountain. In the early spring the bright green of the foliage, the purples of the distant mountains, intermingled with the wild flowers and shrubbery, make a pretty picture.

Mountain climbing prescriptions are a feature of Hot Springs. The government has placed these numbered stones along the roads, so that physicians may prescribe climbs to a certain point.

At the present time nearly a quarter of a million dollars is being expended by the government in the erection of a new free bathhouse for the use of patients who cannot afford to pay for treatments. On a daily average the year round 350 indigent patients receive free baths.

In connection with the new free bathhouse building, one entire floor will be given over to a free clinic. This free clinic will take care of all of the indigent bathers, and is divided into departments according to the nature of the disease. This clinic will be very elaborate and it is hoped to make it one of the best in the South. This takes the place of the old clinic now being operated in the government's old bathhouse, which was organized by the superintendent in 1916. Much benefit has been derived from this clinic and has been a great boon to those indigents who are unable to pay for medical treatment. Of course, most of the visitors make use of the baths in the paid bathhouses, where charges, however, are regulated by the government. The government does not have any facilities for caring for indigent patients, other than free baths and a free medical clinic, and they must arrange for board and lodging.

In fact, "Have you had your bawth?" is the most important question asked of a person in Hot Springs. Back home if anyone were to ask you that, you would feel very much insulted but in Hot Springs it is all right, and in perfectly good form.

There are approximately fifty hot springs from which the waters are derived. This is stored in reservoirs and distributed to all the bathhouses in the city. There are 536 bathtubs in Hot Springs that are connected with this hot water, and from each of these the government receives $80 a year for use of water. All of this money goes into the fund for the development of the park itself.

Just why these waters should be efficient in the treatment of numerous diseases such as rheumatism and neuralgia has been a much discussed question. The waters themselves are clear and not ill-smelling as are so many hot springs waters. Not so many years ago electroscopic tests of the waters were made, showing that they are radio-active to a marked degree, due to dissolved radium emanation (a gas), rather than to the presence of salts of radium, this accounting for the curative powers. But, of course, a great deal of the success of the baths lies in the outdoor exercises in which all the invalids participate. A rather ingenious system of supervised mountain climbing was introduced by Doctor Parks, the superintendent of the reservation, so that local physicians could make prescriptions of outdoor exercises. Throughout the mountains adjacent to Hot Springs have been placed numbered stone markers. There are four main roads, one comparatively level, one slightly inclined, one moderately steep, and one very steep. The doctor prescribing for his patient marks on a slip of paper the road that his patient is to take and the marker to which he is to climb. The first few days he may climb to only the markers numbered "8" or "10," while a few weeks later he may climb up to "31" or "32" on the mountain. These mountain climbing prescriptions are a unique feature of the Hot Springs Reservation.

3. Everywhere in this National Park are tangles of light and shade with distant hills popping into view.

The Army and Navy General Hospital occupies a prominent place on Hot Springs Mountain. It is for the benefit of disabled soldiers and sailors whom, it is believed, the waters of the springs will benefit. Application for admission to this hospital should be made to the Adjutant General, United States Army, Washington.

A drive of twelve miles from Hot Springs and one is in the Arkansas national forest. For one who is uninitiated in the Arkansas country, a trip in or near this forest is unique. Approximately 640,000 acres are embraced in the forest and more is constantly being added. Splendid hunting and fishing are to be found throughout this country. Deer and turkey make it certain that no one will have to miss his Thanksgiving dinner. It is hoped to establish some game refuges in this forest where the animals will multiply and gradually spread over the surrounding country. Where this has been done in eastern states great success has greeted the venture. Owners of land near these refuges have been able to sell hunting privileges on their land at such high figures that the Forest Service has been unable to purchase any more land adjoining the refuges. There are many parts of Arkansas where land can still be purchased almost for a song and doubtless as its possibilities become more fully appreciated, the country will become more densely settled.

Sidetracking Disarmament

THE suspicion is growing that the Porter Resolution, introduced in the House to "broaden" the Senate Resolution regarding a disarmament conference, is a deliberately planned attempt to sidetrack the whole proposition. Senator Borah's resolution simply requested and authorized the President to call a conference of the three great naval powers, Great Britain, Japan and the United States, for the calm consideration of a reduction of the present competitive building programs. It suggests the eminently practicable and effective first step toward disarmament.

Mr. Porter's resolution proposes what every thinking man well knows is an impossibility. It is that the conference to be called should include *all* the European and the Latin-American powers, and that it should deal with the whole subject of disarmament, including land and air as well as sea forces. It proposes the attainment of the millennium of disarmament at a single bound. This despite the fact that in the Senate Committee hearings on the subject such men as General Pershing and General Bliss, Admiral Sims and Benson and the then Secretary of State, Mr. Lansing, all pointed out with conclusive reasoning that such an expansion in the scope of the proposed conference—because of the present world situation—would inevitably defeat its purpose, deferring indefinitely any real progress in the direction of world disarmament.

Obviously petty, if not dishonest, pretexts are urged by the leaders of the majority party in the House for the substitution of the Porter for the Borah proposal. One is that it would protect Presidential prerogative from Senatorial infringement; another that it would evince a more careful regard for the tender national susceptibilities of France, Italy and Spain. Even if we grant the fullest weight to these considerations, it is difficult to imagine sane and sincere legislators letting them stand for an instant in the way of the tremendously momentous issue that is at stake—the issue of peace or war throughout the world for at least a generation. Is President Harding "playing horse" with the disarmament issue? Are the Republican leaders blind and deaf to the ominous roll and rumble of a fast gathering public opinion demanding action, not words—action that shall mean in the eyes of all men at least an honest first step toward the mad and ruinous race for naval supremacy?

The defeat of the Borah Resolution now can mean nothing less than the yielding of the administration to an alien and sinister pressure which, for its own ends, is inimical to world disarmament and bending all its resources to prevent that consummation so devoutly to be wished by every loyal citizen of the United States and every well wisher of humanity.

Who is blocking disarmament?

The Sun's Power

TENNYSON tells us with lyric persuasion that the "Golden Age" is not to be mourned as lost in the dim past nor dreamed of as in the far future, but realized as a present reality, "ever at our door." Historians and philosophers use the term in fanciful reference to the Rome of Augustus, the Italy of the Medici, or Elizabethan England. Even the skeptical Ingersoll connected the emergence of Shakespeare with the flood of the yellow metal to Europe that followed the discovery of America and the exploitation by the Spanish "Conquistadores" of the mines of Mexico and Peru. Harder headed students dwell on the stone age, the iron age, the coal age, and just now petroleum seems to figure as the greatest of economic factors in our modern life, exerting tremendous influence not only on the course of industrial and financial progress, but also on those policies of nations which sway the balance now to war and now to peace.

Petroleum is important because petroleum means power, and the age of power will be the true golden age. It is already dethroning coal as a determinant of economic development. Still more important than petroleum as a source of energy looms the transmutation of falling water into hydro-electric power. From the ethical point of view, remembering the place power occupies in modern wealth production, hydro-electric power is handicapped by the same strife-breeding circumstance as attends on the utilization of nature's bounty in the coal fields and the oil deposits. That is, it depends on the appropriation of comparatively limited sites on the earth's surface.

For many years, it has been the dream of inventors who are inspired by love for humanity to discover some practically exhaustless source of power by which our cities and homes might be lighted and heated, our cars and carriages run and the wheels of workshops and factories made to turn at infinitesimal cost. Such a discovery, it has been said, would abolish poverty from the earth and advance civilization more in ten years than it has actually advanced in the last thousand.

Naturally enough, investigation has been turned to the possibilities of the ocean's tides and to the sun's heat. In this connection, an English scientist points out certain facts that have immense significance. He tells us that the storm on the sun which recently upset our cables and telegraphs, to say nothing of other repercussions in our terrestrial atmosphere, is only a feeble indication of the most wonderful fact concerning the sun, namely, the enormous amount of light and heat which it is continually giving off. Sunlight is to moonlight as 600,000 is to 1, and its intensity is 150 times as bright as the calcium light. If the sun were encased in a shell of ice 64 feet thick, its heat would melt the shell in just one minute! Or, if a bridge of ice could be built from the earth to the sun, two and one-half miles square in section and 93 millions of miles long, and the entire solar radiation concentrated upon it, the ice would be melted in one second; in seven seconds more that entire massive structure would be dissipated into vapor!

And any day a later Franklin may send up the kite that shall harness this mighty force to man's service, as the philosopher-statesman of an earlier day harnessed the lightnings.

Common Sense Wins

NEW light of distinct meaning for Americans is shed on the European situation in a recent interview by Thomas W. Lamont. He tells us that Germany's acceptance in good faith of the London plan will mean salvation for that distracted country and a new era for the rest of Europe. Doing their best to fulfill the schedule, Mr. Lamont sees the Germans earning the favorable opinion of the Allies. There will ensue in Germany itself, he says, a tranquil and vast increase in production. As a consequence, she will secure added credit abroad and experience a reversal of life in international commerce and intercourse.

This able and thoughtful American financier, in fact, sees in the London settlement the final sweeping away of the great barrier to economic quietude and progress the world over. To Americans, it must in the long run result in a stimulus to manufactures, better markets for our farm products, sound and increasing prosperity in both domestic and foreign trade.

The great question, of course, is how far we can rely upon German acceptance in good faith of a settlement that has been widely heralded as revengeful, crushing, unjust and impossible of fulfillment. On this point, fortunately, Mr. Lamont conveys information that is reassuring.

Jacques Seydoux, chief French economic adviser and author of the Seydoux plan, to which the German Government unofficially assented last January, commanded German confidence as an economist whose fairness is unaffected by political or emotional considerations. Thanks largely to his influence, plans "100 per cent economic" emerged from a background luridly belligerent to the French people, whose excitation—as Napoleon said of himself when he broke a vase in apparent anger—seldom extends beyond their self-interest. Realities of the war settlement which politics had long obscured, were recognized. At last, a settlement on business terms was proposed and accepted.

As one sequence of the war fever, public opinion on either side, it seems, had been misled. The Allies, on the one hand, held that Germany must pay for all the damages of the war. Germany protested against this demand as monstrous and impossible. Common sense has triumphed in a realization that Germany's capacity is the limit of payment. This, entirely aside from figures, is the substantial basis of the settlement. Both France and Germany are to be congratulated on the outcome. Let the world face forward!

A Letter to You!

THE communication appended is from an American citizen, the branch manager of a large industrial enterprise that has its headquarters in an eastern state. The correspondent's name is not given for obvious reasons.

Antwerp, Belgium, June—(By Mail.)

To The Editor:

I am going to take the liberty of bringing to your attention a subject which should interest every American and should have all the publicity possible to bring about a full and free discussion that will result in some very definite action.

Every so often we hear and read a lot about immigration laws; a weak attempt is made to do something; in a short time public interest dies out and we continue to welcome to our shores thousands of undesirables.

To the American situated on this side, especially at a port of embarkation, and thrown in contact with this horde of future Americans, the importance of more strict immigration laws is always fresh. One cannot help but think that it would be a good thing if those responsible for the laxity of our laws and their enforcement could spend a few weeks at some of the European ports.

At this writing, there are thousands of undesirables at Antwerp or on the way, the bulk of whom will get into the States by hook or by crook; bogus passports have been so numerous that special inspectors have been put on. This has improved matters to some extent. A de-lousing plant has been established here; all second and third class passengers get their bath—with many the first in a lifetime. All undergo a very rigid medical examination which also helps but the fact remains that with all this, even though they are de-loused and made temporarily clean, the bulk of them are not desirable citizens. Most of them are Russian or Polish Jews, flocking to our already over-crowded cities, a menace to health and depriving workers of homes without proving of any practical value. They are not agriculturists; do not, and many never will speak our language or adapt themselves to our mode and standard of living; consequently they are undesirable for these reasons alone, to say nothing of the Bolshevistic and Socialistic poison they bring with them along with other diseases.

To make matters harder for the consular officials who do all they can to eliminate as many as possible with the limited authority at their command, a very strong Jewish organization is at work at this and at every other port to do everything that money and influence can do to get these people into the United States. If there is no room in third class, they have the money to pay second class; in fact they are ready to meet any emergency. The Jews are better organized to get undesirables into the United States than we are to keep them out.

Some one will say: "Well, the new law restricting immigration to three per cent will keep out undesirables." It is the opinion of those who are actually familiar with the situation that it will increase the number. As an example to substantiate this we will say that only three per cent of the Polish population in the States is permitted to enter. The Poles are anxious to get rid of the Jews; the result will be that ninety per cent of this three per cent will not be Poles but Jews, and the Jewish organizations are ready to do all the work necessary to secure passports, pay transportation, house them at the port of embarkation, and so on. Under the new three per cent ruling, I do not think orphans adopted by Americans are included; if not, the Jewish organizations will arrange to have thousands adopted by Americans long enough to get into the States.

All European countries need producers, farmers and mechanics alike. There is plenty of opportunity in all of these countries. The real ambitious European is staying at home and in spite of all this, every boat to the United States is packed and millions of people are waiting. Can anyone put forth a good argument in favor of any immigration at this time, much less of the class that is coming in?

I trust you will pardon me for writing at such length but I am anxious to convey the sentiments of the average American business man on this side, hoping that you may see fit to carry this subject to your readers. I only hope that with the added force you can give it, it may be possible to bring sufficient numbers together to organize against and to defeat the Jewish organizations that are bringing thousands of undesirables to our shores and that we may eventually be in a position to invite whom we choose as our neighbors and business associates.

The Gift to Madame Curie

WHEN true historic perspective becomes possible, it is very likely "philosophy teaching by example" will point to an event that occurred in the month of May in this year of grace at the White House in Washington as having a real significance for humanity's future far beyond that attached to doings of the day that at the moment occupy the spotlight.

We may view with more or less discouragement, with more or less sense of importance, the utterances of statesmen and ambassadors, the passing developments in the industrial conflict on either side of the Atlantic, the wars and rumors of wars in Europe and Asia. But when the tumult and the shouting die and names now famous as those of commanders of fleets and of armies, and of rulers of nations or authors of best sellers, have passed into oblivion, the simple fact of this gift to Mme. Curie by the women of America of that very precious gram of radium will stand out shiningly transcendent.

The event, in all that it symbolizes, is assurance of highest hope for the future of humanity. We had thought ourselves swamped by an era of rampant materialism, a people for the most part lost to all sense of the eternal verities.

And lo! the mad whirl is halted for a moment to behold the spectacle of this nation honoring itself and its noble womanhood by a gift to this homely little old lady, so simple and modest, is a spectacle that recalls us to recognition of the fact that in her discovery of that marvelous element, she won place as the foremost scientist of our time and as one of the world's greatest benefactors.

The single gram of radium which Mme. Curie takes home to France is valued at $100,000; but who shall set a price on the gift to humanity of Mme. Curie's discovery!

Mr. Ford's Page

IT IS human nature to want to sit down contented, to get everything so nicely arranged that it will go without tending; but everyone knows that that is not the way life goes. There is a difference of tempo, a difference of purpose, a difference of method between human nature and life. Human nature would seem to be the sleepy pupil, and the forces of life the stern teacher who prods the pupil and keeps him doing what he would rather not do. Which, of course, is the highest education, the best discipline—the power to do what we would rather not do.

Every now and again something comes along to jar us loose, and start us going again. The conditions we thought were settled turn out to be not settled at all. The method we thought was established turns out to be the most temporary of expedients. Life steps in and orders us to move on.

The thermometer is one of the staffs of authority which life wields over us. You will find within a certain belt around the world all the progress that is contained within the world, and the secret of that belt's prosperity, progress, morality and superiority is revealed to us by the thermometer. The thermometer is mightier than the sword. Those races whom destiny has not set within that earth-belt need not be fought with swords; the thermometer fights them and keeps them in their place. The People of the Four Seasons are four times set upon every year by the forces of nature; they have the sternness of winter, the promise of spring, the rich fruitfulness of summer and the beauty of autumn in their make-up. They are not suffered to loll upon the earth as others are. The gad of destiny is always whisking their flanks.

Take the gentler upset which the coming of the present season brings to our ways of thinking. "Spring fever," so-called, and summer discontent are not mere individual restlessnesses, they are comparable to the tremor which sometimes runs through the earth; they indicate that new settlements, new bases are being sought for. What we overlook too often is the fact that our desires are prophets, foretelling what is to be. Millions of people at this season of the year are becoming sensible, often in a dull, dumb, unconscious way, of the difference between the way we have organized our life and the way in which nature has organized the world.

People go out under the trees and beside broad waters; they endure dust and heat and crowding and the plaints of children, to seek a place where they may lie on a shaded hill and idly watch the cloud-fleets sail the sky. They get a new sense of the expanse and freedom of the world. Their minds range where there are no walls, no bounds, no close schedule of limitations.

Say what you will, this contact with nature, though it be but for a day, is more than a pleasure, more than a vacation from work; it is a jolt. People are made sensible of a jar between what is and what might be. Reflective people do not even enjoy the time of their vacation as they ought to, because it comes so clear to their minds that something is wrong. They may be inclined to think that it is merely their freedom from their usual work that causes this uneasiness, their freedom to think once more—but that is not always the case. The Voice of Nature is saying to them, "Up, for this is not your rest, you must march on!"

It is not that the city is hot; the country is hot too. It is not that the city means daily toil; there is daily toil in the country too. But somehow, at this season of the year, when the men of the cities come into the temples of the groves, and see miles of meadows and the sweep of rivers, they are torn between two feelings—first, that the cities have their disadvantages; second, that the cities have their advantages too.

One thing you may set down as true is that the cities are doomed. Not immediately, but perhaps much sooner than even the most adventurous are willing to believe. There is no city now existing that would be rebuilt as it is, if it were destroyed; which fact is in itself a confession of our real estimate of our cities.

There is a strange new movement afoot, which is well to attend a little. Never was there such an influx of people from the country into the cities; never was there such an exodus of people from the cities into the country. The two go on together. The people who don't know the cities are flocking in, as many as can. The people who do know the cities are flocking out, as many as can.

Now it means this: the city has had a part to play in the civilization of the world, and that part is now being played with accelerated speed. All our cities have changed their inhabitants the last few years. More and more people have been passed through them to gain what they have to give. When the full part is played, and it is being played out fast, cities will pass off the stage. To this many lines of indication agree.

CITIES have a work to do, but when that work is done, cities will cease. Cities are schoolrooms through which most of the population of the country has been passed, and the pupils get out of them again as quickly as they can. The movement of the country to the city and the city to the country is a movement that will some day empty the cities and transform the country. In the cities men learned how to live, and now that they are carrying that learning into the country, the function of the city as a place of residence seems to be about done. As central assembling plants and distributing points, some of the cities might continue to exist; but not as living places for hundreds of thousands of people. The city had a part to play in the civilization of mankind, but that part has been played.

So, the unrest we are beginning to feel, and which we increasingly feel at this season, is prophetic. Men are going to live nearer the source of things, not walled away like exiles from the very sun by which they live, and from the very soil that gives them bread.

The city had a place to fill, a work to do. Doubtless the country places would not have approximated their present livableness had it not been for the cities. By crowding together, men have learned some secrets. They would never have learned them alone in country life. Why, even the fresh air method of treating tuberculosis is a city discovery. Sanitation, lighting, social organization, all these are products of men's experience with each other in the city.

That is to say, practically all the improvements that have been made in country life have originated in the city and have passed on to bless the country. In that we may see the city's place in the world—it was a gathering place in which men might work out those necessary devices of successful living which, when transplanted into the country, would make the desert blossom as the rose and, what is better, make the gray waste of life a colorful thing.

People who are getting out of the cities now are taking the best of the cities with them—those discoveries and inventions which make life safe and pleasant, and which unburden men of loads that are better borne by iron and steel.

It is not the advantages of cities that are doomed, but the disadvantages—the congestion, the inequality which reigns even in the matter of air and sunlight and ground space. And yet, the world has known for many centuries that air and sunlight and ground space were not of themselves the infallible sources of happiness and success, for without certain improvements even country life becomes an insupportable drudgery and an unrelieved loneliness. The advantages of the country are natural; the advantages of the city are human; when both are fused, as they are being fused, the cities lose in large degree their justification for existence. When they bring their best to the country, their work is done.

Cities, in the sense of central assembling places for manufacture and commerce, may continue to exist; but people will live outside them. Wherever people can carry with them the advantages which the city has produced, they move out of the city. And that is the natural, necessary movement; for you cannot carry the country into the city, it cannot be done; or if it could be done, the city would be destroyed in the process. But you can carry the city into the country, without destroying the country, but even improving it.

So while it is clear that cities are to pass, let us not regard them as a sad blunder; they were a school for the race. They taught us something. They filled their place and did their work of education. But an end comes to every phase of education, and it seems clear that an end is coming to this also.

Roosevelt Dam, master project of the Reclamation Service.

The Wonder Valley

By WILLIAM ATHERTON DU PUY

I WELL remember the day of my first coming into the Wonder Valley. What boy of eight is not wide-eyed with expectancy at every turn of the road when first he ventures from the place of his birth and the reel of the world begins for him the unwinding of even its commonplace scenes?

This, however, was an experience to be remembered though viewed from the middle point of an active life. The time was 1884 and the place an oasis born of water in the heart of the desert of the great Southwest. Conceive, if you will, barren stretches west from San Antonio as great as the distance between New York and Birmingham. Then visualize alternating gray desert sand and gray sagebrush plain east from Los Angeles as far as it is from Chicago to Kansas City. Now picture the pioneer and his family drawn by the lure of the unknown, responding to the instinct to fill up the empty spaces of the world, vaguely pursuing fortune's rainbow, lost in this infinity.

So, as a small boy, I saw the Wonder Valley in the beginning. Geronimo, last of the warlike Indian chiefs, was still at large, taking his merciless toll of settlers' blood. Army posts dotted the waste places of the Southwest. Plain, patient, everyday men and women from Michigan and Mississippi, from Missouri and Maryland, were feeling the urge of the pioneer, were facing unknown difficulties armed only with their racial resourcefulness, were planting the germ of civilization along the border.

The Southern Pacific Railroad Company had but lately completed the titanic and empire-building task of welding two strips of steel across this waste of plain and desert. Even earlier the army and the pioneer had linked one water hole with another until the trail wound westward without end. Maricopa Wells had been a camping place where men, bound for California by this southern route, might satiate their thirst. It became a station on the railroad and now Phoenix, in Salt River Valley, thirty miles away, was springing into life.

We came to Maricopa after much travel in day coaches—father, mother, sister and I—bound for the new land of hope. We rocked that thirty miles in an old Concord stage just like those in the wild west shows—cowboy-driven, prospector-laden—and arrived at the baby town of the desert. A one-story adobe house, built in a hollow square, Mexican fashion, was the hotel that harbored these dauntless optimists upon their arrival. Similar adobe houses lined a street a quarter of a mile long. Beyond was the sagebrush.

But beside the intersecting streets were little ditches and down each of these sparkled crystal-clear water from the little canal above the town. And upon their banks grew verdant cottonwood trees and below the town they spread out upon the fields that were green with alfalfa, forage crop of the Spanish padres, then unknown to Americans except in the Southwest and later destined to become the far-flung and favorite hay crop of a nation. In this running water lay the promise of a miracle that was to come. In it, Darrell Duppa, a vagrant scholar working as a common laborer, had seen the possibilities of the future, had visualized the community that was to be, built here on the ruins of a prehistoric civilization, and had named it Phoenix.

Beneath this diversion ditch, which boasted no security beyond that of a brush dam across the river and head gate built in sand, my father settled on a tract of sagebrush land. The farmhouse was adobe-built and consisted of two rooms, with a brush shed between. The roof was of dirt as was the floor until we later covered it with gunny sacks. The green of our alfalfa fields was the only break in the gray of the sagebrush plains.

The third day after we were installed, we were gathered about the family table for the noonday meal when a weird thing happened. My timid little mother raised her eyes to the window opposite and, behold! it was a frame for the faces of a dozen naked Indians. Following her frightened gaze we saw these and others at other windows solemnly observing us. In the doorway a stately buck, clad only in a breechclout, stood with one bare leg akimbo, its foot on his knee.

They were but friendly and curious man-children come to visit these strange people who had settled in the midst of their favorite rabbit drive. In the years that followed I went with them on many a hunt and learned to ride and shoot a bow and arrow as one of them.

In these swaddling days of the Wonder Valley we lived through many an experience typical of the times that are gone. We had, for instance, a neighbor whose name was Dildy, one of those instinctive defiers of the law who had been hurried into the West by the authorities. My father owned a highly ornamented, ivory-handled six-shooter such as inspired pride in the breasts of quick-firing residents of the border. Becoming utilitarian on his homestead he traded his revolver to Dildy for a shot gun for use against the chicken hawks.

So, when Dildy got into a controversy with another settler over a claim and shot and killed that settler with the ivory-handled six-shooter, we felt some degree of responsibility. That feeling was intensified when the sheriff's posse went for Dildy and father's pistol snuffed out two more lives. Western justice found its mark when the outlaw, pursued into the mountains, was caught and hanged to a cottonwood tree in the public square of Prescott.

Even more gripping to me was the experience of Rollie Harris, a neighbor boy who at times worked for us. Rollie was six or eight years older than I and of such physical strength and prowess as to elicit my ardent admiration. But at eighteen he became a horse-thief and died in his saddle in full flight—a proof of the marksmanship of the early guardians of the law.

For the fifteen years that followed, the Wonder Valley, and those who lived in it, fought that long series of intense and tragic battles that ever falls to the lot of the pioneer. These blazers of trails had but a gossamer connection with that civilization that lay beyond the rim of hills of their horizon. Their little oasis was surrounded by great stretches where nature planted naught that was not adorned with a thorn and watered the plain so inadequately that the bones of the stout-hearted, dead of thirst, became its milestones. People who never knew entertainment, comfort, proper clothes or food; who fought abject poverty on their claims—a poverty of the plain more desperate than that of any tenement—lived here and clung with stolid tenacity to their strips of green. The Wonder Valley began when John Swilling threw a dam of brush across the river and dug his ditch leading on to the plain. It was followed by another and yet another ditch at higher and higher levels, each covering more land than its predecessor. The railroad finally came and the community evolved into an ever-widening garden like unto Damascus, the oldest city in the world, also a child of water wed to the desert.

But Salt River in the summer time when crops were thirstiest was but a ribbon drawn through the sand wastes and men fought for its limited waters and for lack of it many homesteads parched and died. Yet at times the rain fell on its vast watershed and the torrent flowed four miles wide and swept all before it.

At such times the dams went out and the farmers came with their teams, worked like so many beavers to replace them and often lost their crops before the task was performed.

For twenty years the Wonder Valley flung about like a young man unable to find his life work and failed of success. Its first love was that king of the open country, the beef steer, grown on the range and fattened on the alfalfa fields which thrive perennially. Once planted, such a field, unplowed and unfertilized, will yield seven crops of hay a year to the end of time if it but get water.

But this, the Nile Valley of America, the nook of the nation with the longest growing season, the settling pot of the ages for the sediments from the chaos of mountains round about, was born for more intensive purposes than cattle raising.

Men came and planted orange groves and they throve as in sunny Italy. Date trees from Arabia were brought to yield their succulent fruit. The fig, of Smyrna, the apricot, the grape, here found a home. Soon solid trainloads of cantaloupes and watermelons were hurrying to Chicago at the very opening of the season.

But over all hung the pall of an uncertain and inadequate water supply.

Then in the days of Roosevelt came a benign government and said to these experimental pioneers: "We will give you your heart's desire—water for all your available acres, perennial, inexhaustible."

The pioneer listened and was skeptical. Utopia was a land of the imagination. Man could not hold up his hand to the four-mile-wide floods and stop them. That chaos of useless rock mountains as big as an eastern state could not be used as is the roof that fills the barrel with soft water when it rains hard.

But government engineers had seen a vision. Of all the West, here was located the reclamation project that was nearest perfect. Seventy miles above Phoenix the Salt River had cut a sheer 300 feet through the solid rock of a mountain range. It was as though nature's saw had bitten a notch in the trough of a state that a tongue of water might flow through. The wedge should be put back, the trough should again be filled. It would mean adequate water for all who might find homes in the valley below.

The vision has been made a reality. The genius of man has welded two mountains together. I stood the other day in the bottom of the shady canyon below this stupendous dam. Like the stairway of a colossus it rose above me 284 feet. I knew that back of it was a column of water reaching to its very top, and back of this column was the weight of a stretch of it twenty-five miles up the canyons in which the navy of the nations might come to anchor. And a boy turned a wheel like that which guides an automobile and nozzles above me opened or closed and released or imprisoned the floods. These nozzles are the heart valves through which the lifeblood of the Wonder Valley flows.

The valley in which rests the lake created by Roosevelt Dam used to be known as Tonto (Fool) Basin and through it I passed as a lad in a buckboard twenty-five years ago, and in it I shot many quails. Ten years earlier it had been the battlefield of the Grahams and Tweksberrys, rival cattlemen and sheepmen who had here fought each other to extinction. The wife of a neighbor of ours was a sister of the Tweksberrys, half-breed Indians, and through her we got our first-hand war news.

Not until long after the completion of the Roosevelt Dam did the residents of Salt River Valley give the project their entire confidence. They refused to believe that the plan would work until the lake became a reality and the water flowed steadily into their ditches. Then they refused to believe that the condition was constant until years had passed and the flow had been unbroken. Finally there came in 1917-18-19 three years of almost unprecedented drouth and the stored water in abundance lasted through. Now the project is proved even to those who live under it.

The Indian maiden, much more elaborately garbed than in 1886.

With abundant water, prosperity came overnight to all who owned land in this valley. Ten tons of hay on an acre in a year, seventy bushels of wheat, two fat steers — even these spelled prosperity. The government, in its faith, had advanced the money for the project—$12,000,000 altogether. And now the farmers, in their prosperity, are paying it back. In the end it will cost the government nothing to have performed the miracle of the Wonder Valley.

But recent developments under Roosevelt Dam have far

outstripped even the vision of those who conceived it and made it a reality. In the beginning a power house was set in the canyon below the dam and the escaping waters with their hundreds of perpendicular feet of pressure were passed through its dynamos and set to generating electric power. Transmission lines were built to carry this mystic spark over mountain and desert to the towns and settlements, there to furnish ample and cheap power for whatever purpose it might be needed. There was unlimited electricity for whoever wanted to buy. A mining company at Globe, forty miles away, wrote a contract for $400,000 worth of electricity a year. Other customers are appearing. New dynamos are being installed. The profits go into the fund which reimburses the government. In a few years the debt will be repaid. Then the profits from power will maintain the project and pay money into the pockets of the farmers who will own it. Because of the efforts of a benign government unlimited water, breeder of wealth for them, will cost them nothing.

Yet even this is but the beginning of the wonder that has come to Salt River Valley. The denouement has been the development of long staple cotton, the highest bred cotton in the world, the cotton that tops all others in price, the cotton which can be successfully grown in no place else in the United States but in this Southwest.

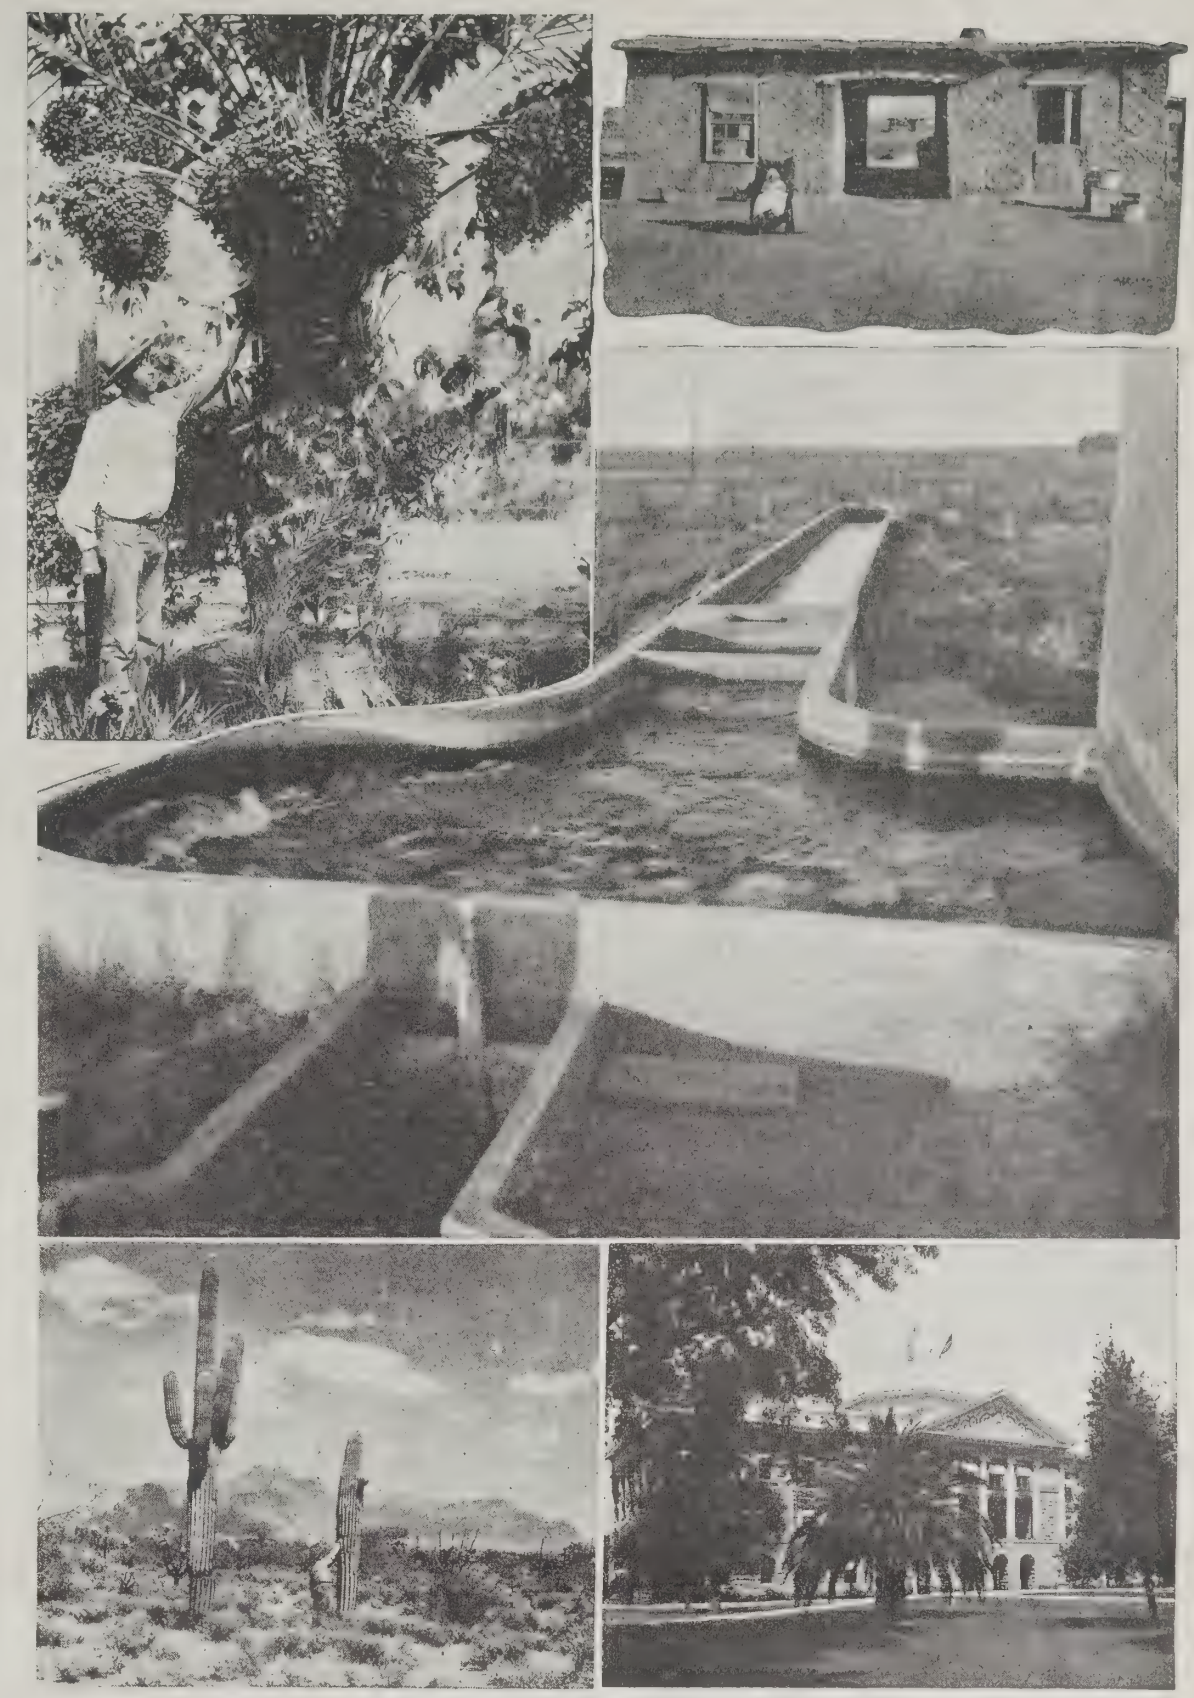
The very existence of long staple cotton in Arizona is in itself a romance of science. Cotton with a long fiber makes stronger thread than ordinary varieties with shorter fiber. Egypt used to have the choicest long staple cotton in the world and American thread manufacturers sent overseas and bought it. Our Department of Agriculture resented this fact and brought the best Egyptian breeds to this country and tried to grow them. The difficulty was in keeping the varieties segregated. Egyptian cotton might be planted in the South and might thrive. When it came to bloom, however, some honey bee that had been harvesting its sweets in an adjoining field of ordinary cotton would come visiting. It would wipe its feet on the door-mat of the Egyptian cotton bloom. Those feet would have on them the plebian pollen of common cotton. When the bee brought that pollen to the Egyptian cotton it consummated a wedding between the two and the cotton resulting was a hybrid. It was no longer Egyptian. The two cottons could not live side by side and remain distinct. There is much deterioration in Egypt because inferior grades have been getting in.

But Arizona had a thousand miles of desert between it and any other variety of cotton. It had the long-growing season needed for the Egyptian varieties. Knowing this the patient scientists of the Department of Agriculture had, for ten years, been growing the best grades of Egyptian cotton down there. They would each year select their most promising individual plants and shake the pollen from one to the other, planting the seed which resulted. Thus did they build up better and better breeds. Finally they established a new type of cotton. They named it "Pima" after the tribe of Indians on whose reservation the experiment station was located. Long staple Pima cotton, native of Arizona, today tops the market of the world.

In 1912 the government scientists asked the farmers of Salt River Valley to grow this long staple cotton and about sixty of them responded. As usual the pioneers experienced hardships, met obstacles. It was an unaccustomed sort of farming, the facilities were not developed for handling and marketing the crops. The cotton brought about twenty cents a pound, which was from two to three times the price of the ordinary fiber. The undertaking showed possibilities. Production steadily increased until the war came and the price dropped down, in 1914, to fifteen cents a pound.

In 1915 the great advance started, Arizona cotton went to twenty-five cents a pound. This meant real money. A year later it sold for forty-three cents, in 1917 at sixty-nine cents; in 1919 at eighty-six cents a pound. To be sure there was a slump in the winter of 1920-21 for all cotton tumbled and there was a cessation in the manufacture of tires, but this circumstance did not affect the fundamentals that underlie this industry.

All this came to pass because a great new use had been found for long staple cotton. It had gone into airplane wings as a substitute for flax during the war. But it had also been found that cord tires for automobiles made of long staple cotton had strength and endurance far beyond those made of any other. The tire manufacturers were bidding for this cotton.



So here was a region which had a virtual monopoly on a product for which the demand was greater than the supply. There were no other considerable areas in which it could be grown. The demand was increasing.

Here is what a good farmer can do on one acre. He can plant and cultivate it for $125. If his work is efficient his return will be a 500-pound bale. This bale at sixty cents will bring him $400 and profits of $275. The average Salt River Valley farm is about fifty acres. On such a farm the season's profits are nearly $14,000. A hundred acre farm, if efficiently handled, is good for, in annual profits, from $25,000 to $30,000. These facts have been demonstrated. The case is proved.

So has the Wonder Valley come to be a cotton patch which is cultivated with the intensive care of a Chinaman's garden. Those beautiful alfalfa fields that have yielded their unstinted crops for a generation have been plowed up, vineyards have been subjected to the grubbing hoe, orchards to the axe. From mountain to mountain, sixty miles from east to west and thirty miles from north to south, there is a vast sheet of this pure-bred fiber, broken only here and there by established and more profitable squares in the checkerboard occupied by orange groves and olive and walnut orchards. Merchants have left their stores, lawyers their practice, teachers their classrooms and gone upon the land. There is a rush to it like that to gold discoveries in the same near-by mountains a generation ago.

E. W. Hudson, the government scientist who evolved "Pima," experienced the money madness, got a virgin 800-acre tract and made $200,000 on it the first year.

Yet the marvel of the Wonder Valley has not stopped even there. One of the great tire-making companies, in its anxiety to insure its supply of this cotton, came to Arizona to grow its own. Finding that all the land supplied with water from the established irrigation project was already divided among small farmers, it sought other possibilities. It had ambition to play the rôle of Moses and smite other rocks from which water might gush forth. So it went out upon the desert waste to which water could never be made to flow from any stream or reservoir—to land that man had looked upon as eternally beyond hope. But as it unreeled its miles of copper wire and this wire was tied back to the dynamo at the foot of Roosevelt Dam, over it came that power which is electricity. And the electricity hitched itself into pumps, reached into the bowels of the earth and brought forth life-giving water.

Top, Left—The date daughter of Egypt finds a home in the Wonder Valley. Top, Right—Typical home of the early settler. Center—Concrete ditches today where yesterday there were sand trails. Bottom, Left—The desert before water came. Bottom, Right—The State Capitol at Phoenix.

One passes down a lane of sagebrush that follows the copper wire. Presently there emerges from the waste a bit of a tower that looks strangely modern and industrial. The purr of machinery emerges from it and the lap of rushing waters, strangely out of place here in the home of the solitary coyote and the Gila monster. One approaches and behold, gushing forth, a stream of crystal water as big as might flow through his arms made into a hoop! It follows a ditch by the roadside and, as one later learns, is the first of a series of pumping stations. There are two of them every quarter of a mile, each pouring its stream into the ditch, which, thus augmented, evolves itself into a canal carrying an ever-increasing volume of water.

One goes into this pumping plant to be shown by the attendant how it works and is surprised to find that there is no attendant. The whole series of them is operated by one man who presses buttons at headquarters miles away.

When one reaches that headquarters he finds cultivators, driven by those Indians with whom I used to go on rabbit drives, stirring the soil about the roots of 6,000 acres of this new-found cotton, throwing its crown of green this year to a sky that has looked down through the ages but has never before seen aught but dull gray wastes.

Over by the reservation, on Indian land, a new project is being laid out. Under contract the company developing it is to install the pumps for irrigating 6,000 acres, it is to bring the tract under intensive cultivation, is to have the use of it for ten years, and is then to turn it back, with the improvements, to the Indians. Thus are my old friends to become possessed of one of the richest farming tracts in all the world.

And I wonder, as I see it all, if this incidental development of electric power has not demonstrated a way in which much of that useless land of the waste stretches of the West may, after all, be brought under cultivation and converted into model homes for the generations yet to come.

I have not been to Phoenix for twenty years. I checked my bags at the station and wandered up through those streets the feel of which my feet had known through the long years that they had gone unshod. Gone was the odor of damp earth behind the sprinkling wagon, for the streets now are paved. Gone are the hitching racks where we tied our horses when coming in from the country—replaced by parking spaces for automobiles. Gone are the low adobe buildings along Washington street, gone the half doors of the once frequent saloon, the purr of the roulette ball as it spun on its journey to the pockets which bore the lucky number. A prosperous, modern, bustling city has come to pass in which I find little to remember. I wander up the street hoping to be recognized, hoping to recognize somebody. I gaze scrutinizingly into the faces of the passers-by. I pull myself up for I find that I am watching the youngsters of the age my friends were twenty years ago. I see nothing that is familiar, and then—

In the front door of the old hardware store he stands—proud, erect, aristocratic, formal yet friendly, unchanged through all the years, just as I had seen him a thousand times in my youth, grandly displaying the latest thing in harness—Ezra Thayer's old, dapple-gray, papier-maché horse.

Jewish Idea Molded Federal Reserve Plan

What Baruch Was in War Material, Paul Warburg Was in War Finance; Some Curious Revelations of Money and Politics

THE last view the reader had of Paul M. Warburg in the preceding article was as "an alien not naturalized" secretly closeted with Senator Nelson W. Aldrich and a party of bankers on an obscure island off the southeastern coast of the United States, all the members of the party concealing their identity even from the servants by calling each other by their first names.

That conference in its ultimate results was of the utmost importance to the United States, for then and there were formulated those fiscal devices, those financial methods, those "monetary reforms" which have exerted an influence on every citizen, rich and poor, of the Republic.

Much history was made in that little trip. It irresistibly calls to memory that other trip made in 1915 —almost two years before America's entry into the war —by Bernard M. Baruch. As readers of THE DEARBORN INDEPENDENT of November 27, 1920, will recall, Mr. Baruch had been financial backer of the Plattsburg camp, and in his testimony he said he thought that General Wood would admit this. Then—"I went off on a long trip, and it was while on this trip that I felt there ought to be some mobilization of the industries, and I was thinking about the scheme that practically was put into effect and was working when I was chairman of the board. When I came back from that trip I asked for an interview with the President . . . . The President listened very attentively and graciously as he always does." Mr. Baruch was an authority on the President's demeanor, for there was a long period in 1917 and 1918 during which he called at the White House every afternoon.

Baruch a Parallel of Warburg

TWO momentous trips in our recent history, both of them signalized and given their principal meaning by the presence of Jews. Not that there should not have been Jews in either case; to insist upon their total exclusion would be going too far. The Jew as a citizen, bearing his part, is one matter; the Jew as a master, directing the national show, is quite another thing. It is by no means agreed that Barney Baruch was the only man in the United States who could have run this nation's war business. That is the explanation made of the high place he took—that he was the *only* man who could do it. Nonsense! If that be so, let us close up the nation and hand the keys over to the New York Kehillah. Mr. Baruch could say—"I probably had more power than any other man did in the war; doubtless that is true," but he had that power because he was for the time the head and front of the Jewish group for war purposes.

If the explanation of Jewish mastery at critical moments were "brains," well and good, but if it were, it would be more evident to the people; brains do not need to be advertised, they advertise themselves. There is another reason.

The British public recently awoke to the fact that not Lloyd George but Mr. Montagu and Sir Alfred Mond were in charge of the recent negotiations over the German indemnities. These gentlemen are both Jews, one of them of German descent. Of all the British Empire are they the only two men to advise the premier in a great crisis? If they are, why is it? The Montagus, we know, control the silver of the world; Sir Alfred Mond, we know, turned the very neat trick of keeping the sign of the Cross off the war memorials raised to the soldiers of the empire; their Jewishness always so apparent. Both financiers; both the close advisers of the premier; as Baruch to Wilson, so they to Lloyd George.

"Warburg Created the Federal Reserve"

APPARENTLY there are no Anglo-Saxons on either side of the sea capable of managing these deep matters, if we are to judge from the war administrations—those that have passed off the stage and those that still linger. Lloyd George, for once stung to the quick by the criticism of the British public of his tendency to closet himself with Jews when confronted with a crucial question, retorted bitterly—with what? With the old outworn Jewish propagandist boast, that it ill became people who sang Jewish psalms in church to rag the race that wrote them! A most illuminating defense! The world would give a good deal for a true psalm from Sir Alfred Mond, Mr. Montagu, or even Sir Philip Sassoon who is soon to become the premier's son-in-law.

In our own history, Barney Baruch boldly claims his place, he unhesitatingly asserts that he had more power than any man in the war. If Allenby in Palestine needed a locomotive, if the Americans in Russia needed clothing, if the munition mills needed copper—it was Baruch who gave or withheld the word.

Mr. Warburg, being of somewhat finer grain, probably due to his having less than Mr. Baruch of the rough experience of "the Street," does not make the claim that he is the chief factor in the present monetary system of the United States, nor does THE DEARBORN INDEPENDENT undertake to make it for him lest the cry of "anti-Semitism" wax wrathful again; but fortunately the fact is amply attested by a Jew whose knowledge of the matter is unquestionable.

Readers have doubtless become aware by this time that for a non-Jew to say that a certain Jew is a most important factor in any field is to be guilty of anti-Semitism, while for a Jew or a "Gentile front" to say it is perfectly proper. It is a rather odd etiquette in which simple minds sometimes become confused.

Professor E. R. A. Seligman, of Columbia University, is the sponsor of this great honor for Mr. Warburg. What Professor Seligman says is of such importance, both as to its source and its subject, that quotation is justified: (the italics in all cases are ours)

"It is in a general way known to the public that Mr. Warburg was in some way connected with the passage of the Federal Reserve Act, and his appointment to his present responsible position on the Federal Reserve Board was acclaimed on all sides with a rare degree of approval and congratulation; but I fancy *it is known only to a very few how great is the indebtedness of the United States to Mr. Warburg. For it may be stated without fear of contradiction that in its fundamental features the Federal Reserve Act is the work of Mr. Warburg more than of any other man in the country.* . . .

"When the Aldrich commission was appointed it was not long before Senator Aldrich—to his credit be it said—was won over by Mr. Warburg to the adoption of these two fundamental features. The Aldrich Bill differed in some important particulars from the present law . . . . *The concession in the shape of the twelve regional banks that had to be made for political reasons is, in the opinion of Mr. Warburg as well as of the writer of this introduction, a mistake;* for it will probably, to some extent at least, weaken the good results which would otherwise have followed. On the other hand, the existence of a Federal Reserve Board creates, in everything but in name, a real central bank; and it depends largely upon the wisdom with which the board exercises its great powers as to whether we shall be able to secure most of the advantages of a central bank without any of its dangers . . . .

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

Mr. Warburg "Educates the Country"

"IN MANY minor respects also the Federal Reserve Act differs from the Aldrich Bill; but in the two fundamentals of combined reserves and of a discount policy, the Federal Reserve Act has frankly accepted the principles of the Aldrich Bill; *and these principles, as has been stated, were the creation of Mr. Warburg and of Mr. Warburg alone.*

". . . . *It must not be forgotten that Mr. Warburg had a practical object in view. In formulating his plans and in advancing slightly varying suggestions from time to time, it was incumbent on him to remember that the education of the country must be gradual and that a large part of the task was to break down prejudices and remove suspicions. His plans therefore contain all sorts of elaborate suggestions designed to guard the public against fancied dangers and to persuade the country that the general scheme was at all practicable. It was the hope of Mr. Warburg that with the lapse of time it might be possible to eliminate from the law not a few clauses which were inserted, largely at his suggestion, for educational purposes.*

"As it was my privilege to say to President Wilson when originally urging the appointment of Mr. Warburg on the Federal Reserve Board, at a time when the political prejudice against New York bankers ran very high, England also, three-quarters of a century ago, had a practical banker who was virtually responsible for the idea contained in Peel's Bank Act of 1840. Mr. Samuel Jones Lloyd was honored as a consequence by the British Government and was made Lord Overstone. The United States was equally fortunate in having with it a Lord Overstone . . . .

"The Federal Reserve Act will be associated in history with the name of Paul M. Warburg . . . ."—(pp. 387-390, Vol. 4, No. 4, Proceedings of the Academy of Political Science, Columbia University.)

It surely cannot be considered invidious for THE DEARBORN INDEPENDENT thus to introduce to the people of the United States a gentleman whose influence upon the country is so vital. Just how vital can be understood only by those who have studied the puzzle of a country filled with the good things of life, and still unable to use them or to share them because of a kink in the pipe line called "money."

But that Mr. Warburg himself is not entirely unaware of his position is indicated on page 56 of his testimony quoted last week. Mr. Warburg had just told the Senate Committee that he was making a heavy financial sacrifice to accept the position on the Federal Reserve Board offered him by President Wilson, and into the fitness of which appointment the Senate was carefully inquiring:

> Senator Reed—"May I ask what your motive is, or your reason for making that sacrifice?"
>
> Mr. Warburg—"My motive is that I have, as you know, taken a keen interest in this monetary reform since I have been in this country.
>
> *"I have had the success which comes to few people, of starting an idea and starting it so that the whole country has taken it up and it has taken some tangible form."*

Professor Seligman advises us of the strategy that was used to get the whole country to take up Mr. Warburg's idea, and of the fact that some of the items inserted to appease the public might easily be removed when the public shall have become accustomed to Mr. Warburg and the Federal Reserve Board; but Mr. Warburg adds another hint, to the effect that you can do some things by administration which you cannot do by organization.

"I Won't Show You How to Work It"

FOR example: Mr. Warburg wanted *only one central bank* which should be the sole arbiter of finance in the United States. The United States Government would have almost nothing to do save to make the money and stand back of it; the bankers of the United States, and the people thereof, would have nothing to do except what they were told; the one central bank would be the real financial governing authority.

When asked by Senator Bristow to state the fundamental difference between the Aldrich plan and the present Federal Reserve plan, Mr. Warburg replied:

> "Well, the Aldrich Bill brings the whole system into one unit, while this deals with 12 units, and unites them again into the Federal Reserve Board. It is a little bit complicated, which objection, however, *can be overcome in an administrative way;* and in that respect I freely criticized the bill before it was passed."

There is evidently, then, a method of administration for which severe critics might even use the word "manipulation," by which the plain provisions of a banking law, whatever they may be, may be, if not evaded, then somewhat adapted.

This idea is brought to mind by a more colloquial expression of Mr. Warburg's to be found in his address on "bank acceptances" delivered in 1919:

> "In this connection I am reminded of a story I once heard concerning a man belonging to a species now soon to be extinct and to be found by our children in Webster's dictionary only, the 'bartender.' A man of this profession, in prehistoric times, was abandoning his position and was turning over his cash-register to his successor. 'Please show me how it works,' said the newcomer. *'I will show you how it works,'* said the other, *'but I won't show you how to work it.'"*

The Interpartisanship of Internationalists

THE politics or Mr. Warburg and the firm of Kuhn, Loeb & Company formed part of the inquiry, and Mr. Warburg made some interesting revelations, which illustrate the oft-repeated statement that it is part of Jewish policy—perhaps of large financial firms generally—to attach themselves to both parties so that certain interests may be the winners regardless of which party is defeated.

> Senator Pomerene—"What are your politics?"
>
> Senator Nelson—"No; we have not raised that before this committee."

Senator Reed—"It has not been raised here, but I should like to know."

Senator Pomerene—"It has been raised before the Senate."

Senator Reed—"I will say why I should like to know."

Senator Pomerene—"Well, I have no objection to saying what was in my own mind."

The Chairman—"I will say that I do not know what Mr. Warburg's politics are."

Senator Pomerene—"Well, I did not."

Senator Shafroth—"I do not know and I do not care to know."

Senator Pomerene—"I heard the statement made that the entire board was Democratic, and I had understood that Mr. Warburg was a Republican, or had been, in his affiliations."

Mr. Warburg—"Well, so I was; and my sympathies were entirely, in the early campaign, for Mr. Taft against Mr. Roosevelt in the first fight. When later on Mr. Roosevelt became President Wilson's opponent my sympathies went with Mr. Wilson . . . ."

Senator Reed—"Well, you would count yourself a Republican, generally speaking?"

Mr. Warburg—"I would."

Senator Bristow—"It has been variously reported in the newspapers that you and your partners directly and indirectly contributed very largely to Mr. Wilson's campaign funds."

Mr. Warburg—"Well, my partners—there is a very peculiar condition—no; I do not think any one of them contributed largely at all; there may have been moderate contributions. My brother, for instance, contributed to Mr. Taft's campaign."

Senator Bristow—"Just what would you consider a moderate contribution to a presidential campaign?"

Mr. Warburg—"Well, that depends who the man is who contributes; but I think anything below $10,000 or $5,000 would not be an extravagant contribution, so far as that should be—"

Probing Jewish Political Sagacity

(Examination resumed another day.)

SENATOR BRISTOW—"Now, Mr. Warburg, when we closed Saturday some Senator asked you in regard to political contributions, and I understood you to say that you contributed to Mr. Wilson's campaign."

Mr. Warburg—"No; my letter says that I offered to contribute; but it was too late. I came back to this country only a few days before the campaign closed."

Senator Bristow—"So that you did not make any contribution?"

Mr. Warburg—"I did not make any contribution; no."

Senator Bristow—"Did any members of your firm make contributions to Mr. Wilson's campaign?"

Mr. Warburg—"I think that is a matter of record. Mr. Schiff contributed. I would not otherwise discuss the contributions of my partners, if it was not a matter of record. I think Mr. Schiff was the only one who contributed in our firm."

Senator Bristow—"And you stated that your brother had contributed to Mr. Taft's campaign, as I understand it?"

Mr. Warburg—"I did. But again, I do not want to go into a discussion of my partners' affairs, and I shall stick to that pretty strictly, or we will never get through."

Senator Bristow—"I understood you also to say that no members of your firm contributed to Mr. Roosevelt's campaign."

Mr. Warburg—"I did not say that."

Senator Bristow—"Oh! Did any members of the firm do that?"

Safe Three Ways—Wilson, Taft, T. R.

MR. WARBURG—"My answer would please you probably; but I shall not answer that, but will repeat that I will not discuss my partners' affairs."

Senator Bristow—"Yes. I understood you to say Saturday that you were a Republican, but when Mr. Roosevelt became a candidate, *you then became a sympathizer with Mr. Wilson and supported him?"*

Mr. Warburg—*"Yes."*

Senator Bristow—*"While your brother was supporting Mr. Taft?"*

Mr. Warburg—*"Yes."*

Senator Bristow—*"And I was interested to know whether any member of your firm supported Mr. Roosevelt."*

Mr. Warburg—*"It is a matter of record that there are."*

Senator Bristow—*"That there are some of them who did?"*

Mr. Warburg—*"Oh, yes."*

Senator Bristow—"Will you please indicate—or do you care to indicate—what members of your firm supported Mr. Roosevelt in that campaign?"

Mr. Warburg—"No, sir; I shall have to go on the principle that I cannot disclose the business of a member of my firm."

The result was this: that in a three-cornered fight between three candidates, Roosevelt, Taft and Wilson, the men who constituted the firm of Kuhn, Loeb & Company, chief Jewish financial institution of the United States, distributed their support among all three. Schiff for Wilson; Felix Warburg for Taft; and an unknown for Roosevelt—was that unknown Mr. Kahn? In any case, Wilson won, and the above examination relates to a member of the firm of Kuhn, Loeb & Company receiving an important appointment which gave him large power over the finances of the United States.

The point of not discussing the affairs of Kuhn, Loeb & Company was frequently made by Mr. Warburg.

"I cannot discuss the affairs of the firm nor my partners, nor be asked to criticize acts of my partners, either to approve them or in any other way. I would like to say that before we come to the point where I would feel that I should not answer any question," said Mr. Warburg.

The principle of this objection was conceded by the Senate Committee, but that it ought to serve as a blanket injunction against a number of pertinent inquiries was doubted.

Senator Bristow—"But you are a partner in this firm, and have you not had something to do with its operations and its management?"

Mr. Warburg—"Yes."

Senator Bristow—"Does that not go to show your general views and practices as a financier and as a citizen and as a business man?"

Mr. Warburg—"Yes; but you have got to take them individually. . . . I cannot permit my firm to be drawn into this discussion."

Senator Bristow—"But how can you divest yourself from your firm when you have been one of the managers of the firm?"

Mr. Warburg—"I shall divest myself of the firm."

Senator Bristow—"If the firm has done something that I might think was improper—to illustrate, being called upon to say whether or not I approve your nomination to this responsible position—have I not a right to know what your attitude was in regard to that transaction which your firm performed?"

Mr. Warburg—"Well, inasmuch as my answer there might be a criticism of my firm, I would beg to be excused, and I would leave it to the committee to draw its own conclusions . . . ."

Divorcing Business From Life

IN EXAMINING Mr. Warburg about the handling of $100,000,000 Southern Pacific securities, the same difficulty was experienced; Mr. Warburg objected, "but we are getting here again into the transactions of my firm!"

To which Senator Bristow retorted—"Ah! but when you participated in the profits of the transaction, is it not a part of your business life?"

Mr. Warburg—"Certainly it is a part of my business life, and there is no reason why I should not be proud of it. But as a matter of principle I think we should not get into a discussion of the business of my firm."

Senator Bristow—"I am discussing your business."

Mr. Warburg—"No, you are discussing the firm's business."

Senator Bristow—"Did you get any of the profits that came from the handling of this $100,000,000?"

Mr. Warburg—"You may take it that whatever my firm did I got my profits—my share in the profits."

Senator Bristow—"Your share in the profits. Now, without being specific, I take it for granted that this was quite material; that that was quite a material interest in size; that is, that you are one of the important members of the firm."

Mr. Warburg—"I am one of the important members of the firm."

Senator Bristow—"Yes, I think the testimony and the report here show that you are the third important member—or the second, which is it?—of the firm."

Mr. Warburg—"We are not numbered."

Senator Bristow—"You are not; all right."

Mr. Warburg—"There is Mr. Jacob H. Schiff who is the senior."

Senator Bristow—"Yes."

Mr. Warburg—"And the others rank very much alike."

Senator Bristow—"Yes. We may take it for granted, then, that whatever profits accrued to your firm in the handling of this business here since you became a member of it, you participated in the profits as one of the partners?"

Mr. Warburg—"Yes, sir."

Senator Bristow—"Yes. So I will assume then, of course, that you participated in the marketing of $113,000,000 of Union Pacific, and so on."

The responsibilities of a member of the Federal Reserve Board, especially such a member as Paul M. Warburg would be (for it was recognized that because of his purpose and connections he would become a dominating factor), were very great, especially at the time when the appointment was being considered. They are as important now, of course, but in a different way; it is not now a question of military safety. This thought was evidently in the mind of the senators, as the following shows:

Senator Hitchcock—"Mr. Warburg, *one of the important functions of the board is to guard the gold supply of the country,* and it has been thought that *it is very important to have men on the board who had at heart only the interests of the United States,* and had no foreign interests or alliances. You have said that you proposed to divest yourself altogether of your banking connections in Germany. Have you any other interests in Europe?"

"No, not to speak of," said Mr. Warburg. "I may have very unimportant things, like everybody has; but I could dispose of those; it would not amount to anything."

Senator Hitchcock—"Nothing in the line of banking?"

Mr. Warburg—"No."

A few moments later the chairman, Senator Owen, said—(the date was August 1, 1914)—"We are on the eve of a great European war, and the organization of this board is of great national importance."

At this time, Mr. Warburg was a member of the Hamburg firm. He testified (p. 7)—"I am going to leave my Hamburg firm, though the law does not require me to do so."

A part of the German firm of his father and brothers, a part of the American firm to which he and his brother were related by marital as well as financial ties, Mr. Warburg repeatedly said he would break off all business relationships so that he, like Caesar's wife (to quote himself) should be above suspicion.

Jewish World Notes

This choice bit is from the pen of H. L. Mencken, not entirely unknown in the United States, and was printed in the Baltimore *Evening Sun,* May 16: "The most ambitious of these new Southern magazines is the *Double-Dealer,* published in New Orleans. Of its four editors, one has a Scotch name and two others seem to be Jews. Well, it is not surprising. The Jews are always two or three laps ahead of the people they live among, intellectually speaking. The Southerners—that is, the well-to-do low-caste Southerners who now run the South—dislike them because they are shrewd commercially . . . . . It would not be unprecedented for the Jews to repay these swine by civilizing the South in spite of them."

The Eastern Jew rules in the United States: that is the conclusion to be drawn in the recent defeat of the Mack-Brandeis forces at the Cleveland convention. The defeat did not indicate, as some over-zealous Jew-defenders eagerly insisted, a split among the Jews. It only indicated which idea is supreme. Unfortunately, it is not the American Jewish idea that is now supreme, although the defeated groups promise to constitute a formidable minority.

Senator France, who has defended Red Bolshevism and Sovietism on public platforms in this country, has gone to Russia to "get the facts." There is difficulty about his entering Russia. The Bolshevik authorities appear to be growing tired of admitting their American admirers, only to have them turn sick on their hands with the sights they see and the tragic disillusionment they undergo.

So many Jews are going to Mexico in the hope of evading the new American immigration laws, that the Jews of that country are appealing to Jewish leaders overseas to stop the influx. The reason for the Mexican invasion is that the immigration law excludes only those coming from Europe. A landing in Mexico is made for the purpose of finding a loophole through that provision.

Rabbi I. Mortimer Bloom says: "There are too many Jews in the world. If hundreds of thousands of Jews in this country would withdraw entirely from the Jewish fold, it would be a distinct boon to Jewry at large."

Boston decided that it is "bad form" to extend the "freedom of the city" to any visitor. Boston made known that decision in time to prevent following New York's custom of extending the freedom of the city to well-advertised Jewish visitors.

The Hearst papers say of Jewish bankers—"They are sometimes abler than their Gentile brothers, that is what stirs up the trouble."

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents each in stamps to cover printing and mailing cost.

Putting It Up to the Bankers

The Appended Letter Was Submitted by a Subscriber as a Communication addressed to the American Bankers' Association at Its Meeting in Seattle

TO THE AMERICAN BANKERS' ASSOCIATION IN SEATTLE ASSEMBLED.

Gentlemen: We have grave doubts if your association appreciates and we positively know that the people do not realize the enormous trust our government reposes in your hands. We will analyze this trust. To do so a few facts must be stated.

1. Commerce is the exchange of commodities.

2. Complex exchanges of commodities are impracticable without a "medium of exchange."

3. A medium of exchange must, as an essential corollary, be "legal tender."

4. The "medium of exchange" and "legal tender" are creatures of law only.

5. Making laws is a function of government.

6. Making the "medium of exchange" and "legal tender" (money) is then a function of government.

7. Money is then a law.

8. Law is a few drops of ink on a statute book.

9. The execution of law is a governmental function.

10. The execution of the above law is by keeping money in free natural circulation. To do this the government must keep control of the money.

11. This can be done by the government owning and operating our banks and banking system. There is no other way. This is a plain governmental duty and this important function it fails to perform.

12. The government, by reason of its enlightened ignorance, has delegated this most important function to you as self-constituted executives thereof; and the people, lulled by the harmony of their lamentable ignorance, view this arrangement with angelic resignation.

THIS IS THE ENORMOUS TRUST OUR GOVERNMENT HAS REPOSED IN YOUR HANDS.

So far this arrangement is productive of the following facts:

1. On June 4, 1913, you had those few drops of ink on a statute book capitalized for $1,560,709,447.05.

2. By the provisions of the new Federal Reserve Act you are permitted to earn at 8 per cent per annum on 85 per cent of your deposits, compounded quarterly, 46.7 per cent on the above amount.

3. By leave of this arrangement you have succeeded with these few drops of ink in establishing an interest bearing debt of $20,033,992,043.88.

4. As a slight remuneration to you gentlemen for permitting this law, "medium of exchange" and "legal tender" (money), to descend to the people we paid you last year in cash the sum of $1,242,107,506.72. This was nearly all the ready money we had and has left us bankrupt.

5. You are the sole executors of this trust, accountable to no one, not even the government.

6. You can tell us, the people, just when we can, and also just when we cannot, enjoy the benefits of that law as passed by our government.

7. You dictate exactly the volume of money allowed to circulate at any time and this at your own caprice and at your own price.

8. You may thus provide "prosperity" or "panics" at will whichever suits your ends and make great profit by either course.

We resign our temporal welfare to thee.

We know you are human. We know it is human nature to provide for our neighbors even to our own detriment? We know you will do this for us? We fondly believe you are now in solemn conclave with a single eye to our welfare?

"Temper the winds to the shorn lamb."

Welcome to our city.

We have the honor to remain as ever,
Your meek and lowly subjects,
The People.

The Time Has Come

Happiness is largely the art of remembering—and forgetting—the right things.

It is as bad to think without acting as it is to talk without saying anything.

To aspire is a step upward; to covet is merely to admit your inferiority.

She who flirts and runs away will not run fast enough, some day.

A man is as old as his arteries, a woman as old as her art is.

Only a trifling mind allows itself to be vexed over trifles.

It's never too late to amend an amendment.

From Failure at Sixty to Fame at Sixty-five

An Interview With Charles E. Hetherington

By O. LAWRENCE HAWTHORNE

OUT near Chicago lives a tall, robust, elderly man who has proved to the world that youth is not a time of life; it is a state of mind. That it is not a matter of ripe cheeks, red lips and supple knees; it is a temper of the will, a quality of the imagination, a vigor of the emotions. It is the freshness of the deep springs of life.

This man has also proved that no one need recognize as insurmountable any barrier to the achievement of his dearest ambition.

At the age of sixty years, Charles E. Hetherington took up painting, the ambition of a lifetime. That was seven years ago. Today he is represented in a score of large collections throughout the country, although his paintings have been on the market only two years. A number of leading art magazines and newspapers of the United States have devoted generous space to consideration of the remarkable success of this "overnight" artist.

"Yes, I am sixty-seven years—*young,*" chuckled Mr. Hetherington, "and I am the happiest 'young' man alive. My work from day to day is simply a joy. I know nothing as fascinating as playing with color."

Critics pronounce Charles Hetherington one of America's foremost painters of the beauties of nature. Until two years ago, he was unknown, discouraged, classed as a failure. But worry, doubt, disaster failed to bow his heart and break his spirit. Through all the years of toil and disappointments he had not deserted his ideals.

CHARLES E. HETHERINGTON

At the age of sixty, when a tragic majority of men have fought the battle of life and lost, Charles Hetherington faced "old age" penniless. He had lost a small fortune in business investments. The first of these was the invention of an engine, and later the promotion of a colored motion picture enterprise proved disastrous. It was at this moment that the soul within him came to the rescue and demanded to be heard. He determined to take up art, as a solace rather than with any hope of earning therewith a livelihood.

He had always painted "mentally." In his boyhood near Hamilton, Canada, he spent his idle hours in the woods, dreaming and learning the secrets of nature. His parents emphatically discouraged his boyish desire to study art, ignoring the possibility of any talent, since among his ancestors there had been no artist. At the age of eighteen he began the study of photography, which was to his mind a step toward his cherished goal, yet proved commercial enough to win the approval of his father. At the time of his business reverses, he was head salesman for a New York concern.

Following a suggestion by his wife, to dispel his gloom and seek what comfort he might in a realization of his dreams to paint, he gathered up his pluck and settled down to work. At first he sought inspiration from the beauties of nature about his home. His experience gives apt illustration to these lines from Thanatopsis:

> "To him who, in the love of nature, holds
> Communion with her visible forms, she speaks
> A various language: for his gayer hours
> She has a voice of gladness, and a smile
> And eloquence of beauty and she glides
> Into his darker musings with a mild
> And gentle sympathy, that steals away
> Their sharpness, ere he is aware . . . ."

Soon he became so absorbed in his work that all business disturbances were forgotten.

Having never seen anyone paint or mix colors, he was obliged to rely upon his own judgment, or more likely his genius, in experimenting. He made his own brushes required to produce the effect for which he was striving. In experimenting with the alphabet of color, he spilled his paints on to a piece of plate glass, placing colored paper beneath the glass and blending the colors with a knife, thus obtaining the graduation of tones.

"Grass was a stubborn thing to paint at first," said the artist, "and so was the contrast between calm and rough water."

The difficulty of obtaining the proper perspective was also to be overcome. Through perseverance, constant work from five in the morning until sundown, he has won what younger artists struggle for through years of study—an individuality in painting that reveals the beauty of the artist soul.

With a wealth of experience from upward and downward trends, and the serenity and breadth which come with the autumn of life, Mr. Hetherington has an advantage over the spasmodic enthusiasm and confidence often associated with immaturity. His paintings are aglow with the cheer and wholesomeness that fill his heart.

One feels so greatly refreshed from conversation with this man, because in him is typified the spirit of the Great Outdoors. In him is demonstrated the ennobling power exercised by nature's grandeur on the heart of man, when he answers the call of the infinite. There lies dormant in the breast of every human an appreciation of the beautiful, an interest in the natural and the sublime. Very unfortunate it is that so few of us who now inhabit our river valleys and woodlands take time for little excursions into their delightful areas.

We, whose days are crowded with business and civic affairs, whose nights are governed by the scepter of our social obligations—little do we know of the nobler heritage which they enjoy who frequent nature's solitudes. Little do we know of the habits of wildfowl and other creatures of the woodland. Little do we know of the comfort that comes from intimate companionship with the hills eternal and acquaintance with the handiwork of God.

Mr. Hetherington approached E. J. Timmons, for ten years instructor at the Art Institute in Chicago, on the matter of taking up the study of painting with him. On learning that the self-made artist had never received instruction, Mr. Timmons advised him not to study, saying that scientific training would impair his work, since Mr. Hetherington has a technique all his own. There is no imitation of others in what he does.

Critics make frequent reference to the wonderful color which Mr. Hetherington gives to his canvases. They express so clearly his own love of color. His paintings are largely impressionistic, a departure from the general run of pictures, his impression in some instances spreading a purple haze over the scene.

Especially is this true of an exquisite creation, "Crabapple Blossoms in the Mist," which is owned by an admirer in Rockford, Illinois. "The Old Tote Road," which has been added to the Samuel Scotten collection, the fifth largest in the country, he considers his greatest work. The "Bridal Path" is in the Dole collection, and "Woodland" in the McCurly collection. "The Old Monarchs" he likens to himself, the monarchs being two huge, gnarly oak tree trunks. His versatility is brought to light in "The Old Monarchs," a striking contrast to his other subjects. Others included in his exhibits are "Slender Saplings," "The Short Cut Home," a small and radiant wood scene, and his favorite, "Reflections."

Among the well-known collections in which he is represented is the Cowan collection at Aurora, Illinois. The Union League Club of that city has voted to set aside one of the club rooms as a "Hetherington Room," honoring the artist and his works.

The artist's residence is in the town of Hinsdale. His summer studio is located in the north woods of Michigan at Glen Lake. Here is ideal rustic solitude, many miles from civilization, where he indulges in what without doubt was intended for his life work. Mr. Hetherington believes that a man cannot escape his destiny, and he has reason to think so. He attributes his success, however, in a great measure to the encouragement of his wife and daughter.

Let me leave with you the essence of this man's philosophy, as expressed not only in his conversation and his everyday living but as he has, through the masterful stroke of a great artist's brush, caused it to permeate the atmosphere of his canvases:

Nobody grows old merely by living a number of years. People grow old only by deserting their ideals.

Youth means a temperamental predominance of courage over timidity, of the appetite for adventure over the love of ease.

Worry, doubt, self-distrust, fear and disaster—these are the long, long years that bow the heart and turn the greening spirit back to dust.

Whether sixty or sixteen, there is in every human heart the lure of wonder, the sweet amazement at the stars and at starlike things and thoughts, the undaunted challenge of events, the unfailing childlike appetite for what-next and the joy of the game of living.

You are as young as your faith, as old as your doubt; as young as your self-confidence, as old as your fear; as young as your hope, as old as your despair.

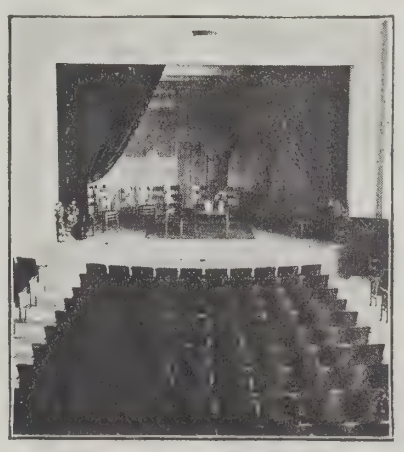
In the central place of your heart is an evergreen tree; its name is Love. So long as it flourishes you are young. When it dies you are old. In the central place of your heart is a wireless station. So long as it receives messages of beauty, hope, cheer, grandeur, courage and power—from God and from your fellowmen—so long you are young.

Charles E. Hetherington has proved it.

One of the finest consolidated schools in the United States.

The high school at Cable, Ohio [consolidated]. Ohio had its first consolidated school in 1892.

Above—The Center, Col., school, dedicated in the spring of 1920. Pupils are transported by automobile to this school from a territory 153 miles square. Below—Jesup school, near Waterloo, Iowa.



Better Schools for Rural America

By R. P. CRAWFORD

Above—Fairview school in Buena Vista County, Iowa. It cost but $25,000 and is a modern building. Below— The consolidated school at Alta, Buena Vista County, Iowa.

THE biggest revolution in educational progress in America the last ten years has been the least heralded. Today, for the first time in history, we seem fairly on the road to solve the problem of the rural school. Everyone is familiar with the little red or white schoolhouse, but few know that today approximately 50,000 of these little one-room country schools have been replaced with fine up-standing structures—schools that in every way compare with our big city institutions. It may seem hard for those unfamiliar with this new development in country life to believe that many of these schools are far better than those in neighboring cities, but that is nevertheless the fact. This new kind of school has transportation systems in connection, automobiles or horse-drawn busses being used to carry the pupils to and from their homes. It takes hardly longer now for the child to attend one of these modern schools than it did a few years ago to attend the one-room school.

Auditorium in the consolidated school at Center, Colorado.

Indiana has more than 1,000 of this new kind of schools and has abandoned approximately 4,000 of its little one-room schools. Ohio has more than 900 consolidated schools. Iowa has more than 400 consolidations. Minnesota, which many people are inclined to believe to be largely a mountainous state, has more than 300 such schools. Colorado, a mountainous state, has over 100. Even North Dakota, with its heavy snows, has more than 500 schools, each serving more than eighteen contiguous sections and with two or more teachers. Approximately 96 per cent of the public school pupils in Massachusetts are attending schools of two or more rooms. There are now approximately 12,000 of this new kind of rural schools in the United States.

One will hardly believe, perhaps, that in Colorado there is one school close to the mountains, which serves a territory 100 miles square and where very few of the more than 300 pupils leave home before eight o'clock in the morning, and almost all are home before five in the evening. There are scores and scores of fine consolidated school buildings in Minnesota, schools that are modern in every way even to vacuum cleaning plants and washed air for the schoolrooms, and in many places the schoolhouse is the only building in the village with running water. There are many counties in Indiana, Ohio and Iowa where there is hardly a single one-room school left.

Perhaps the most remarkable feature is that this great development has come in only the last few years. It took seventeen years for Iowa to secure its first seventeen consolidated schools, but it took only six years to secure the next 300. For the year following July 1, 1919, a new consolidated school was voted for every school day in Iowa. On that date there were only approximately 230 consolidations, but today there are over 400 which have been voted and in most cases have their buildings ready. More than 50,000 children are being transported to school every day in the state of Iowa. Over 2,800 one-room schools have been closed.

Since this development has been rather new in Iowa, most of the school buildings are unusually fine and compare favorably with almost any of those in the cities. Take the building at Jesup, about twenty miles east of Waterloo, Iowa. The total cost of building, grounds and equipment was in the neighborhood of $110,000. It is a fine type of school which must serve both a village and open country and is typical of the new kind of school. There are about 400 pupils, half coming from the country and half from the town. There are forty-eight square miles in the district and thirteen busses are used for transportation.

To give one some idea of the elaborate character of these new village schools, a brief description of the Jesup building may be of interest. The building itself is 159 feet long and 98 feet deep. It has three floors, the lowest floor being nearly level with the ground. The first floor takes care of the first and second grades, the manual training room—which is equipped with some power machinery—the gymnasium, shower baths and locker room, and a lunch room off the gymnasium. On the next, or main floor, are rooms for the seventh and eighth grades, a room for agriculture, a sewing room, and four additional grade rooms. On the third floor there is a model housekeeping suite, consisting of a kitchen, dining room and bedroom, the latter to be fitted out for the course in home nursing There is also a tile bathroom off the bedroom. This is in every way as well equipped as a small home would be. The dining room has a handsome fireplace. The kitchen is equipped with a large gas range and a built-in refrigerator. There are science laboratories on this floor, as well as four recitation rooms.

An auditorium opens into the corridors and as many as 650 people have been accommodated at one time. The stage is equipped with scenery and footlights. Telephones connect every room in the building. There is a large vacuum cleaning plant in the basement, and clocks in every room, operated by one master clock. There is even a covered driveway at one side of the building so that the children can be unloaded from the busses in stormy weather without getting wet. Eight and one-half acres comprise the school grounds, which are laid out like a park. Is this not a contrast to the eleven one-room schools that preceded it?

Take the consolidated school at Boxholm. It was erected four years ago at a cost of approximately $80,000. There is everything that one could think of in this school even to marble shower baths such as one would find only in a big city hotel, and yet it is practically a country school, since of its 300 pupils more than three-fourths come from the country. Or take the consolidated school at Alta, Iowa. The one-room schools have been eliminated in 74 per cent of Buena Vista County, where this school is located. Every day over 200 pupils are transported from the surrounding country to the Alta school. The building which was erected in 1916 represented then a cost of $110,000 with $25,000 spent for equipment.

There is perhaps no state in the Union that has learned to spend as liberally for rural schools as has the state of Minnesota. On one occasion I traveled nearly to the Canadian line and at nearly every station there was a schoolhouse that would compare favorably with those in any ordinary city. There are even consolidated schools miles from any railroad. One such consolidated school was formed by abandoning five log schoolhouses near the shores of Red Lake and fifteen miles from the nearest town. Three years of high school work are offered here almost in the wilds of upper Minnesota. Much of Minnesota's progress in securing its more than 300 consolidated schools has been due to its splendid system of supplying state aid and the state supervision of schools. There is hardly a consolidated school in that state which would not receive $2,500 a year state aid, and many of these schools receive more than $4,000.

The Bloomington school, located about eight miles from Minneapolis, is one of the finest school plants in this country. It is really in the open country, although there are a few houses and stores near-by. They do not, however, constitute even a post office. This school is located on an 18-acre tract of land, with a magnificent view of farming country and woodland in every direction. The total cost of the structure, completed about two years ago, was $100,000, including equipment. There is a washed-air ventilating and heating system and a vacuum cleaning plant. Gas for operating the stoves in the domestic science department is purchased in tanks and kept outside the building.

At each end of the building are small one-story sections. One of these constitutes an auditorium and gymnasium, while in the other part are the various laboratories. The auditorium and gymnasium has an outside entrance, so that farmers' meetings may be held with no interruption to the school work. There is a splendid stage, with dressing rooms and shower baths beneath the stage. The manual training shops and science laboratories are located in the one-story wing at the other end of the building. Like many other consolidated schools in Minnesota, the Bloomington school has a conservatory opening out of one end of the building, with glass on three sides. Here agricultural experiments may be carried on during the coldest winter weather. Remember that this is a country school.

Whenever one thinks of the state of Colorado, he must recall that here are some of the finest consolidated schools in the United States. There are 115 such schools in this state notwithstanding the mountainous country and absence of farming in many sections. Eastern Colorado has a number of consolidated schools, many of them very fine, but we shall confine ourselves to one of the newest schools in the San Luis Valley, where consolidation has secured such a remarkable start.

The Center school district embraces 153 square miles. The school building is said to be the largest consolidated school building in the United States. At least it must be in length, for it is 308 feet from end to end and 87 feet wide. It contains thirty-five rooms, not to mention small rooms used for cloakrooms and storage of supplies.

Center is just a little town of about 800 population. Thirteen acres of land at the edge of the town were purchased for the school grounds; shrubs and trees were planted in front, and the rear of the grounds was left to be used for an athletic field and playground. An auditorium equal to that in almost any city school building has been included in this structure. It has a seating capacity of 700, and is completely equipped with permanent theater seats both on the main floor and in the balcony. There is a real stage fitted out with scenery and curtains. On the first floor is the gynasium with shower baths and dressing rooms. Every mechanical convenience is provided in this building, including electric lights, heating and ventilating system, and telephones in each room. There are about 400 pupils enrolled, half of whom come from the country.

Several thousand schools of this type stand with barred windows in Indiana.

One thousand consolidated schools in Indiana make this state the leader of consolidation in the entire country. Not only that, but from 1890 to 1920, Indiana abandoned 3,990 one-room schools, or 45 per cent of the total number in the state in 1890. In 1902 there were only 181 wagons hauling children to consolidated schools, but by 1918, this number had jumped to over 4,000 (including automobiles which play a big part in the success of consolidated schools today), transporting 57,000 children daily to 897 consolidated schools. Indiana has had a good start over Iowa and Minnesota and now has probably one-twelfth of all the consolidated schools in the entire country.

An interesting provision of the law in Indiana is that any one-room school with less than twelve pupils must be abandoned, and it is optional where there are less than fifteen. The compulsory abandonment does not take place where there are peculiar topographic conditions which make it difficult to transport the children to another school.

What the communities mentioned in this article have done, others can do. To get this new kind of schools in your own state inquire of your state superintendent of public instruction or of the United States Bureau of Education at Washington.

The Farmers Make Known Their Demands

By H. O. BISHOP

AT NO time in the history of the United States have the farmers of the entire country been so unitedly and energetically represented at the National Capitol as they are at present.

The farmers now have the largest nation-wide organization that has ever existed in this or any other country in the world. This organization is known as the American Farm Bureau Federation. Its membership already exceeds a million and a half, and additional enrollments are made every day.

No corporation or business of any kind keeps in closer touch with individual members of Congress, Congressional committees and Cabinet members than do these farmers.

They maintain business offices in Washington, equipped with a corps of keen, shrewd men who seem to know exactly what they want and are going after it with all sails set. The head of the Washington headquarters is Gray Silver, one of the most successful farmers and stockraisers in the country. His services are considered so valuable that the members of the bureau gladly pay him a salary equal to that received by twenty-five or thirty country school teachers or preachers.

Mr. Silver is not a novice in legislative affairs, having served for many years as a state senator and lieutenant governor of West Virginia.

Knowing that the people, as a whole, are manifesting unusually deep interest in agricultural affairs, I asked Mr. Silver to explain just why the farmers deem it necessary to keep in such close touch with Congress, particularly the big important committees. He gazed meditatively out of his office window for several seconds and then turning to me said:

"Why are the farmers represented before the Legislative Committees of Congress?

"That is a fair question, since the average person knows very little about how our national laws are actually written.

"Congress is such a gigantic human machine, representing 531 men from all parts of the United States, that it requires time for a new Congressman to become oriented. He soon finds that legislation is national, not merely affecting one state or Congressional district. If he is so fortunate as to become a member of one of the committees the national character of legislation is borne in upon him quickly. He learns the vastness of the United States and the varied interests of the people. As a member of the committee he especially welcomes constructive suggestions, particularly if those making the suggestions reflect the thoughts of a large group of people.

"The farmers of this country make up a very substantial proportion—30 to 50 per cent—of our entire population. Their industry is fundamental, basic, and the very mudsill upon which the nation is constructed. They cannot sit passively by and see more attention be given to laws which will be of special benefit to organized classes, capital and urban dwellers without voicing protest or at least informing Congress how agriculture views the bill under consideration.

"For many years farmers have represented a very small minority in Congress. We have gone over the list and find only about five men who actually can qualify as farmers. According to their own statements more than half of the members are lawyers and the next largest group is bankers, followed by newspaper publishers, manufacturers, teachers, merchants, insurance and real estate dealers, physicians, owners of public utilities and ministers. Many members of Congress come from sections of the country where agriculture is not the predominating industry, and some of these are indifferent to the needs of agriculture. That, of course, is a very shortsighted view even for industrial interests. There is another group coming from strictly agricultural sections which has the welfare of the farmers at heart and which understands the problems of agriculture, of production and distribution, and, therefore, is anxious to see that agriculture is given a square deal in the laws written on the statute books. Within the last month these men have organized informally in both House and Senate to safeguard farm interests and agree upon united action.

"Since agriculture is not asking for special privileges or class legislation or for anything which will not benefit the population as a whole, it has a logical argument to present to the Congressman whose constituents represent our urban population and our congested districts. Our efforts, therefore, are directed largely to showing these Congressmen that the needs of agriculture are the needs of the nation.

"The farmer is not interested in all the 6,000 or more bills which have been introduced so far this session. He does not care whether some town receives a cannon from the great World War, but he is concerned with big issues such as taxation, tariff, transportation and finance.

"Since the farmers produce about $20,000,000,000 worth of new wealth each year and consume from 40 to 60 per cent of the goods manufactured in this country, it would be idle to explain why he is interested in taxation. Bills frequently are introduced and schemes propounded which would be to the decided detriment of the farmers; they would even go so far as to effect the prosperity of the country as a whole. Happily the present administration has declared itself against the shifting of the burden of taxes. However, some methods of taxation have been advanced that would be to the decided disadvantage of the farmers.

"H. C. McKenzie, our tax representative, recently stated before the Finance Committee of the Senate that a general sales tax would relieve the individuals and corporations with large incomes and increase the tax on the necessities of life. He protested against the enactment of a general sales tax and against the repeal of the excess profits tax and the lowering of the surtax brackets of the personal income tax. He told the committee that the American Farm Bureau Federation recommends that issuing of tax-free securities, Federal, state, municipal and local, be stopped by constitutional amendments; that a board for final adjustment should be established that would settle income disputes; that local boards of assessment be established for assessing income taxes locally on the same general plan as is followed in England; that about 75 per cent of the necessary revenue be raised by income and excess profits taxes, 25 per cent by consumption tax and that a net loss in any year may be deducted from the succeeding year or years.

"The general sales tax is decidedly objectionable to the farmer for he cannot pass the tax on to the ultimate consumer the same as can be done by the manufacturer. With the exception of the farmer's sales the burden of a general sales tax, it is contended, will be placed upon the consumer. This would fall with crushing force on the great mass of people with low incomes and their small savings would be absorbed by taxes. Another fallacy in a just spread of a general sales tax is that there is no relation between sales and net profits. The man dealing in high-priced articles on which there are large gross profits would pay proportionately a smaller tax than the merchant who deals in staple commodities and turns his stock over many times a year in order to make a living. In times of depression, when there are no profits, business would still have to pay the sales tax.

MR. GRAY SILVER,
Head of the legislative department of the American Farm Bureau Federation at Washington, D. C.

"Since the price of the farmers' merchandise is beyond his control he would have to pay a sales tax and in addition an income tax. Besides these two taxes, he would have to absorb as a consumption tax all that the trusts and closely controlled corporations are able to hand back to him.

"The tariff problem presents an intricate puzzle not only for agriculture, but for the manufacturer as well. The American Farm Bureau Federation, representing a million and one-half farmers, has not asked for a tariff wall of exclusion, but such measure of protection or other compensating factor as will equalize the opportunity of the American farmers with the low costs of production in the lands whose living conditions and rates of wages are inferior to our own. In considering such a tariff it has requested that the new economic burden being imposed upon agriculture by high domestic transportation cost, high cost of money, the competition of ocean rates, and foreign exchanges be considered. It has repeatedly asked that the emergency tariff, now long in Congress, be passed.

"Although agriculture does not request special consideration it realizes that organized labor and organized business are interested in agriculture as a source of cheap food and cheap raw material. They frequently have spoken with authority before Congress and little by little the protection that the farmers formerly had has been taken away. At the same time the protection has been retained on factory products. Wool comes in without paying a duty, but clothing is protected by a duty of 35 per cent. Vegetable oils are being imported in this country in increasing tonnage. They are manufactured into margarines which sell in direct competition with butter.

"Unless transportation charges are lowered, the agricultural map of the United States will be changed materially within the next 12 months. Freight rates have been most disastrous in the most remote sections of the United States where agricultural commodities of practically every kind have been allowed to spoil because the prices paid in many instances would not cover the high cost of freight. If transportation rates are not lowered the more perishable commodities as well as the heavy products, such as potatoes, will have to be produced and consumed locally and there will be less seasonal products on the market. Fruit and vegetables have been allowed to rot on the ground in the West and South. Livestock have died on the ranch because owners could not pay their way to feeding stations. Grain is stored in the barn or used as fuel and much cotton has been left in the field. There were several causes which brought about this lamentable situation, but high rates of transportation were most responsible.

"Involved in this problem also is the question of water and rail competition. Wheat can be shipped from Argentine to New York for 10 cents a bushel whereas, it costs 30 cents to move it from Missouri to the same point. Great quantities of our agricultural products, especially wheat, are moved to southern ports for export rather than to ports in the Northeast. This is because of the shorter and therefore cheaper rail route to water. And it costs no more to ship to Europe from the South than from the Northeast. Under these conditions, therefore, it is obvious why agriculture is interested in any legislation which would reduce freight rates. This accounts for its repeated appeals to Congress and commissions to afford relief.

"But the transportation problem is not solved alone by rail or water rates. The farmers' first transportation is from the farm to the primary market, the near-by town, county seat, the nearest railroad station or port. The farmer is making strenuous efforts to obtain farm-to-market roads. In this effort the consumer should be equally interested, for it is over these roads that his food and clothing, in raw form at least, must be hauled. The farmers while not objecting are not particularly interested in pikes or boulevards which run across the country, but they wish to see a good highway system constructed which will enable the rural population, which own more than half of the automobiles and do most of the traveling over the roads, for business purposes, get their produce to market expeditiously and economically.

"It is inconceivable that anyone should advocate seriously the building of great interstate highways, such as are contemplated in the Townsend bill, connecting our cities, when one-third of our farmers live on roads over which it is exceedingly difficult to market their produce, where mail is not delivered or where children do not have a fair opportunity to attend school.

"If Federal aid is to be continued to be given for the construction of highways within the states some authorization by which the same engineering skill will be available for local roads as for the thoroughfares should be afforded. Roads from the farm to railroad stations, to the schoolhouse, to the post offices and to the county seat should be built first, or certainly provided for concurrently.

"We believe that in many places the country can be best served by the building of nine-foot hard-surfaced roads with stone or gravel shoulders. These roads may be widened as travel needs and available funds permit. In short, the farmers are interested in a program that takes into consideration the development of a road system in the state and at the same time makes provisions for inter-county and interstate highways.

"In a study of the bills introduced on this subject the American Farm Bureau Federation is decidedly in favor of the Dowell bill and against the Townsend bill.

"There are a great many farmers in the same condition as the darkey, and they are not all cotton growers either. The farmer has not been very active in the field of finance, but his experiences during the last two years of steady deflation have left him practically prostrate. In April, many months after the process of readjustment set in, the farmer was at the bottom of the well of deflation. His dollar would purchase at wholesale only 82 per cent as much food, 62 per cent as much cloth and clothing, 83 per cent as much metals and metal products, 57 per cent as much lumber and building materials, 68 per cent as much chemicals and drugs, and 42 per cent as much house furnishings as it would have purchased in 1913. But the farmer usually buys at retail prices so his dollar has shrunken even more than these figures would indicate.

"This flattening of the farmer's pocketbook, without a chance to purchase upon the same basis as the balance of the nation, has given him such a jolt that he has decided he cannot afford to be found in such a precarious position again. He is very certain that he is not being adequately financed through the present system. Short-term commercial credit, as it is now available, is jeopardizing his welfare. The fact that commercial banks have to maintain very liquid form of assets which can be called upon very quickly in times of stress has been called to the farmers' attention many times recently and it may be that this form of banking is not proper for the demands of agriculture.

"An effort is being made to secure the financing of agricultural commodities based on warehouse receipts issued after the products are stored in a bonded warehouse. This would make agricultural production liquid or mobile and result in making more money available to the farmers. The federation also favors and is try-

The Southland's Magic City

By JOHN TIPPEN

BIRMINGHAM, metropolis of Alabama and industrial center of the South, will have a birthday party in December in the form of a semi-centennial celebration. There will be fifty candles in her birthday cake, which would indicate that she is still in knickerbockers. And this is true, in so far as years are concerned, for Birmingham is a mere infant in age. But in size and strength she is a full-grown adult. The celebration will continue over a period of weeks and will be marked by historical pageants. An address by President Harding will be the grand finale of the celebration of the city's fiftieth anniversary.

Although the Indians were here when DeSoto came, the valley in which Birmingham is the central jewel—the valley itself having an elevation of seven hundred feet, but which is surrounded by high mountains and red hills of iron ore and coal—there are indications that the Red Man was not the first inhabitant of Jones Valley. For, just north of the city, there were formerly two great mounds, mute evidence that Birmingham once was the home of the pre-historic Mound Builder. These mounds have been leveled in the past few years by the white man in his quest for coal and iron, of which neither the Mound Builder nor the Indian knew the value.

Not a great many years ago the valley in which the present city nestles was the common camping ground of Indian tribes. Then the white man came. The early settlers knew the red outcroppings on the hillsides were composed of iron ore, but they were more interested in corn than in iron. Hence, the iron mines remained unworked and the coal veins untouched until comparatively recently.

Birmingham was incorporated in 1871, with less than a thousand population and including an area of a few square acres. Now the city is spread over fifty square miles and comprises fifteen townships. Many residents of Birmingham today are familiar with the very founding of the city. There are business men in Birmingham who can remember the time, not so very long ago, when an entire square could have been purchased for a yoke of oxen. Prior to the boom days of 1875-76, immediately after the downtown streets were laid off, fifty-foot lots were sold, some of them for a bushel of corn. Others, more desirably located, brought from five to fifty dollars. On these same lots today mighty steel skyscrapers stand, their peaks towering above the smokestacks of outlying furnaces and their upper stories being almost on a level with the crests of surrounding mountains.

The city spent a large proportion of its early tax collections in establishing a correct system of street-routing. Those pioneers apparently had visions of the metropolis to come, for no calf trails were followed. As a result, Birmingham has straight, wide thoroughfares, eighty to one hundred feet in width, the streets running approximately north and south and the avenues east and west. Both streets and avenues are religiously numbered. Few of them are known by name.

Of course, subdivision projects are permitted necessary liberty in the matter of curved avenues. The pride of Birmingham is Highland avenue, winding in and out around the side of Red Mountain and hedged on both sides for miles with magnificent residences. And on beyond this lie Mountain Terrace, Milner Heights, and Forrest Park, beautiful beyond compare and forever protected by deed from the encroachment of business establishments.

The principal residence sections are two and a half to six miles distance from the center of the business district, lying southeast, slightly southwest and northeast from the heart of the city. It is to the southeast that hundreds of mansions virtually cling to the side of Red Mountain, some of them being at the very top, with a view of the city in panorama to the north and a woodland vista to the south.

Birmingham could not be anything other than a city of industries. The very location forces her to be a city of manufactures. Iron ore is taken from the hills on one side, converted into iron at the furnaces, transferred into steel and manufactured into finished products within sight of the original mines. The furnaces are heated with coke made from coal taken from the same district.

The proximity of every element entering into the making of steel and iron, with consequent low prices on raw materials, has drawn to the Birmingham district countless industries, manufacturing every conceivable article in which iron or steel are used, from carpet tacks to steel rails and railway cars; from wire to skyscraper frames and steamships.

The value of rolled steel and other steel products turned out by Birmingham plants is in excess of one hundred million dollars annually. Nearly five million tons of coke are produced each year. The district mines in excess of ten million tons of coal each twelvemonth. Steel and pig iron total one million two hundred thousand and two million five hundred thousand tons respectively. Four million barrels of cement are produced annually. The operating industries of the district have a total valuation of over a quarter of a billion dollars.

There are two hundred and thirty-six coal mines and forty-four iron ore mines in the district. Twenty-seven pig iron furnaces, with tongues of flame shooting skyward, illume the entire district with a weird, reddish glare at night. It is estimated that the district has more than a billion and a half tons of iron ore in its hills, a quantity sufficient to supply the present number of furnaces for one hundred and sixty years. The coal veins are virtually inexhaustible. The cost of production of iron and steel is lower in Birmingham than in any other district in the world, according to President Elbert H. Gary, of the United States Steel Corporation, due to the proximity of all elements entering into their manufacture.

Birmingham's first church, built nearly fifty years ago. It is still standing in Elyton, a suburb.

While Birmingham is four hundred miles removed from the Gulf, it has practically all the advantages of a deep-sea port. Federal improvement of the Warrior River, at a cost of millions, has made this stream navigable from Birmingham to Mobile the year round. Ocean-going barges transport raw materials and finished products from Birmingham southward on this stream at the rate of hundreds of tons a month, while upstream cargoes consist of merchandise of all descriptions, fertilizers and nitrates. Cities as far away as Chattanooga and Meridian are now receiving large shipments over the Warrior through Birmingham in order to reap the twenty per cent saving in freight rates over all-rail tariffs.

In 1900 there were twenty-five churches in Birmingham; today there are one hundred and fifty-six white and one hundred and forty-nine Negro churches. There are fifty-five public schools, twenty-five private schools, three high schools and three colleges. Construction work is already under way on a new central high school, which will be completed at a cost of half a million dollars.

The most wonderful development has come within the last eighteen years. Less than a score of years ago there was not a ten-story building in the municipality. Today towering skyscrapers form a jagged horizon when viewed from the surrounding hills. Twelve of them are among the tallest buildings in the South, and the twenty-seven-story Jefferson County Bank building is the highest structure south of the Ohio River.

Birmingham has a total of fourteen parks, some of which are not yet fully developed. The total park area is six hundred and thirty-five acres. One of these, Woodrow Wilson Park, three blocks removed from the business district, is the heart of a proposed civic center. A bond issue of five hundred thousand dollars has been voted and a site purchased adjoining this park for an auditorium capable of seating ten thousand people. The civic plan calls for the grouping of the municipal library, museum, city and county and other public buildings about the park. The estimated cost of the new structures is ten million dollars. The new Federal building, an entire block in length, which has just been completed at a cost of two million dollars, is a block and a half away.

During the war Birmingham exceeded her quota in every instance in every Liberty bond drive and every Red Cross campaign, and in the number of fighting men sent to the front. In some instances the oversubscriptions were as high as four hundred per cent.

Birmingham is the fastest growing city of its size in the United States, according to the 1920 census statistics. It has a population of two hundred thousand.

This is Birmingham on her fiftieth birthday. This is the Magic City of the Southland.

The "De Witt Clinton," the first locomotive and passenger train ever run in New York. This locomotive was built in America.

Early History of Our Railways Is Romantic

IN THE early days of the United States there were only four ways for the public to travel from one place to another—walk, horseback, stagecoach or rowboat. All four methods were used, depending upon the state of finances of the traveler.

In this era of palatial and swift-moving railway trains it is rather difficult for a present-day American to realize that in the early days of their country steam railroads were merely hazy dreams of the far-distant future.

It is altogether likely that in a few generations from now articles will be written telling all about the slow, pokey, primitive methods that people had to put up with away back in the old-fashioned days when the only means of getting over the country was by steam railway. The day is bound to come when passenger trains will be junked in favor of something swifter and more comfortable. Doubtless the grandchildren of the children of today will visit museums and amusedly look at ancient relics labeled "Pullman Car" and "Locomotive," bearing printed signs explaining that they were in general use throughout the United States during the first half of the twentieth century.

The first railroad built in the United States was three miles long, extending from the granite-quarries of Quincy, Massachusetts, to the Neponset River. This road was commenced in 1826, and completed in 1827. It was built with granite sleepers, seven and a half feet long, laid eight feet apart. The rails, five feet apart, were of pine, a foot deep, covered with an oak plate, and these with flat bars of iron. The cars were pulled by horses.

The second railroad was commenced in January, 1827, and completed in May of the same year, extending from the coal mines near Mauch Chunk, Pennsylvania, to the Lehigh River, nine miles. From the summit of the road, and within half a mile of the mines, the descent by a plane was nine hundred and eighty-two feet, inclined two hundred and twenty-five feet to the river, and thence twenty-five feet in a chute to the spot where the cars were discharged into the boats. The cars descended by gravity with the loaded wagons, and were drawn up again by mules. The rails of the road were of timber, laid on wooden sleepers, and strapped with flat iron bars.

In 1828 the Delaware and Hudson Canal Company constructed a railroad from their coal mines to Honesdale, Pennsylvania, the termination of their canal. The Baltimore and Ohio Railroad and the South Carolina Railroad were also commenced in the same year.

The Baltimore and Ohio railroad was the first road in America to attract national attention. The first meeting to form a railroad company in the United States, to connect the waters of the East with the waters of the West, was held in Baltimore, February 12, 1827. The practicability of the project was left to a committee who soon after reported at the second meeting, on the 19th, and a resolution was passed to obtain a charter from the legislature. The charter was obtained, and on April 24, 1827, the company was organized, and the first board of directors elected.

The construction of the road was commenced by laying a corner stone July 4, 1828, attended by one of the most magnificent processions of the military and civil associations, trades and professions, ever witnessed on any occasion in the United States up to that time.

The venerable Charles Carroll, of Carrollton, then over ninety years of age, the only survivor of the signers of the Declaration of Independence, was present on the occasion and laid the corner stone with appropriate ceremonies. It is related that, on this occasion, after the ceremonies were over, the venerable patriot said to one of his friends present: "I consider this among the most important acts of my life, second only to my signing the Declaration of Independence, if even it be second to that," and to the end of his life he continued a firm friend of the work.

The construction of the Baltimore and Ohio Railroad was commenced in 1828, and completed in 1852. On January 12, 1853, in honor of the completion of the road, a magnificent banquet took place in Wheeling, West Virginia, its western terminus. At that time it was the longest railroad in the world.

At this banquet Mr. Swann, the president of the company, in his address, made this beautiful allusion to the venerable and patriotic Carroll: "There are those present who witnessed the enthusiasm which attended the laying of the first stone, by the illustrious Charles Carroll, of Carrollton." He then produced the trowel which had been used by Mr. Carroll, and was still preserved by the company, with this memorandum on it: "This trowel was used by Charles Carroll, of Carrollton, to lay the first stone of the Baltimore and Ohio Railroad, July 4, 1828."

When these pioneer railroads were commenced their builders had no idea of operating trains on them with locomotives. Their plan was to use horses or mules. The steam engine was an afterthought. Even ship sails were tried on several roads prior to the advent of the use of the iron horse. Two ways of utilizing the horse as motive power were evolved by the early railway magnates; one was to hitch the horse to the front end of a car, and the other was to put the horse inside the car where it produced power on a treadmill.

This horse-treadmill locomotive was tried on the Baltimore and Ohio with indifferent success. On one occasion when drawing a car filled with editors and other representatives of the press, it ran into a cow, and the passengers, having been tilted out and rolled down an embankment, were naturally enough unanimous in condemning the contrivance. And so the horse power car passed out of existence, and out of mind.

Following the horse power car on the B. & O. came the Meteor. This was a sailing-vehicle, the invention of Evan Thomas, who was, perhaps, the first person who advocated railroads in Baltimore. The Meteor required a good gale to drive it, and would only run when the wind was what sailors call abaft. Head-winds were fatal to it, and Mr. Thomas was afraid to trust a strong side-wind lest the vehicle might be upset; so it rarely made its appearance except when a northwester was blowing, when it would be dragged out several miles and come back, literally with flying colors. The Baltimore and Ohio Railroad, being the first in operation in this country, and almost the first in the world for the transportation of passengers and merchandise, of course was visited by crowds from almost every section of the United States, as well as from parts of Europe. Among them was Baron Krudener, envoy from Russia, who, by invitation of Mr. Thomas, made an excursion in the sailing car, managing the sail himself. On his return from the trip, he declared he had never before traveled so pleasantly. Mr. Thomas caused a model sailing car to be constructed, which he presented to the baron, with the respects of the company, to be forwarded to the Emperor. This courtesy on the part of Mr. Thomas was handsomely acknowledged by the baron.

Like the horse car, the sailing car had its day. It was an amusing toy—nothing more—and is referred to

Horse power locomotive used on South Carolina railroad in 1829-30.

now to illustrate the crudity of the ideas prevailing ninety years ago in reference to railroads.

The South Carolina railroad, extending 136 miles from Charleston to Hamburg, also had an inning at horse and sail power. The Charleston *Courier* of March 20, 1830, contains the following account of "Sailing on Land":

"A sail was set on a car on our railroad yesterday afternoon, in the presence of a large concourse of spectators. Fifteen gentlemen got on board and flew off at the rate of twelve to fourteen miles an hour. Thirteen persons and three tons of iron were carried about ten miles an hour. The preparations for sailing were very hastily got up, and, of course, were not of the best kind; but owing to this circumstance the experiment afforded high sport. The wind blew very fresh from about northeast, which, as a sailor would say, was 'abeam,' and would drive the car either way with equal speed. When going at the rate of about twelve miles an hour and loaded with fifteen passengers, the mast went by the board, with the sail and rigging attached, carrying with them several of the crew. The wreck was descried by several friendly shipmasters, who kindly rendered assistance in rigging a jury-mast, and the car was again soon put under way. During the afternoon the wind changed so as to bring it nearly ahead when going in one direction; but this did not stop the sport, as it was ascertained that the car would sail within four points of the wind. We understand it is intended by some of our seamen to rig a car properly, and shortly to exhibit their skill in managing a vessel on land."

Much laughter and ridicule were indulged in when an inventive genius named Peter Cooper brought to Baltimore a new-fangled dingus which he said was a steam locomotive. Mr. Cooper named his engine "Tom Thumb." The firm having the contract to operate with horses that part of the B. & O., then finished as far as Ellicott's Mills, sought to put a quietus on such foolish contrivances as locomotives, by staging a race between a car drawn by their speedy dapple gray, and one drawn by the locomotive. This celebrated race occurred August 28, 1830. A description of the race from a publication of that period says: "The great stage proprietors of the day were Stockton and Stokes; and on that occasion a gallant gray, of great beauty and power, was driven by them from town, attached to another car on the second track—for the company had begun by making two tracks to the Mills—and met the engine at the Relay House, on its way back. From this point it was determined to have a race home; and, the start being even, away went horse and engine, the snort of the one and the puff of the other keeping time and time.

"At first the gray had the best of it, for his steam would be applied to the greatest advantage on the instant, while the engine had to wait until the rotation of the wheels set the blower to work. The horse was perhaps a quarter of a mile ahead, when the safety-valve of the engine lifted, and the thin blue vapor issuing from it showed an excess of steam. The blower whistled, the steam blew off in vapory clouds, the pace increased, the passengers shouted, the engine gained on the horse, soon it lapped him—the silk was placed—the race was neck and neck, nose and nose—then the engine passed the horse, and a great hurrah hailed the victory. But it was not repeated, for just at this time, when the gray master was about giving up, the band which drove the pulley, which moved the blower, slipped from the drum, the safety-valve ceased to scream, and the engine, for want of breath, began to wheeze and pant. In vain Mr. Cooper, who was his own engineer and fireman, lacerated his hands in attempting to replace the band upon the wheel; in vain he tried to urge the fire with light wood; the horse gained on the machine and passed it, and although the band was presently replaced, and steam again did its best, the horse was too far ahead to be overtaken, and came in the winner of the race. But the real victory was with Mr. Cooper, notwithstanding. He had held fast to the faith that was in him, and had demonstrated its truth beyond peradventure. All honor to his name!"

To the Delaware and Hudson Canal Company belongs the credit for having operated the first locomotive on the Western Hemisphere. The date of this epoch-making innovation was August 8, 1829. This road was in Pennsylvania, and connected the coal mines with the canal. This famous engine, known as the "Stourbridge Lion," was built in England expressly for the Delaware and Hudson Canal Company.

Horatio Allen, assistant engineer of the company, had the distinction of handling the throttle of this engine on its initial trip. While making a speech in 1851 at Dunkirk, New York, in celebration of the completion of the New York and Erie Railroad, Mr. Allen made the following reference to his trip on the first locomotive on the American continent:

"To bring before you as strikingly as in my power, it has occurred to me to lead your imagination to the conception of the scene which would present itself if, on some fine morning, you were placed at an elevation, and gifted for the moment with a power of vision which would command the railroad movements of the whole United States. There would be presented an exciting picture of activity, in thousands of iron horses starting forth from the various railroad centers, or traversing the surface of the continent in all directions. When the imagination has attained to some conception of the scene, let it seek to go back to the time when only one of these iron monsters was in existence on this continent, and was moving forth, the first of his

mighty race. When was it? Where was it? and who awakened its energies and directed its movements? It was in the year 1829, on the banks of the Lackawaxen, at the commencement of the railroad connecting the canal of the Delaware and Hudson Company with their coal mines, and he who addresses you was the only person on that locomotive.

"The circumstances which led to my being left alone on the engine were these: The road had been built in the summer, the structure was of hemlock timber, and the rails, of large dimensions, notched on to caps placed far apart. The timber had cracked and warped, from exposure to the sun. After about five hundred feet of straight line, the road crossed the Lackawaxen Creek on a trestle about thirty feet high, and with a curve of three hundred and fifty or four hundred feet radius. The impression was very general that the iron monster would either break down the road or that it would leave the track at the curve and plunge into the creek. My reply to such apprehension was, that it was too late to consider the probability of such occurrences; that there was no other course but to have the trial made of the strange animal which had been brought here at such great expense, but that it was not necessary that more than one should be involved in its fate; that I would take the first ride alone, and that the time would come when I should look back to this incident with great interest. As I placed my hand on the throttle valve handle I was undecided whether I would move slowly or with a fair degree of speed; but believing that the road would prove safe, and preferring, if we did go down, to go down handsomely and without any evidence of timidity, I started with considerable velocity, passed the curve over the creek safely, and was soon out of hearing of the cheers of the large assemblage present. At the end of two or three miles, I reversed the valves and returned without accident to the place of starting, having thus made the first railroad trip by locomotive on the Western Hemisphere."

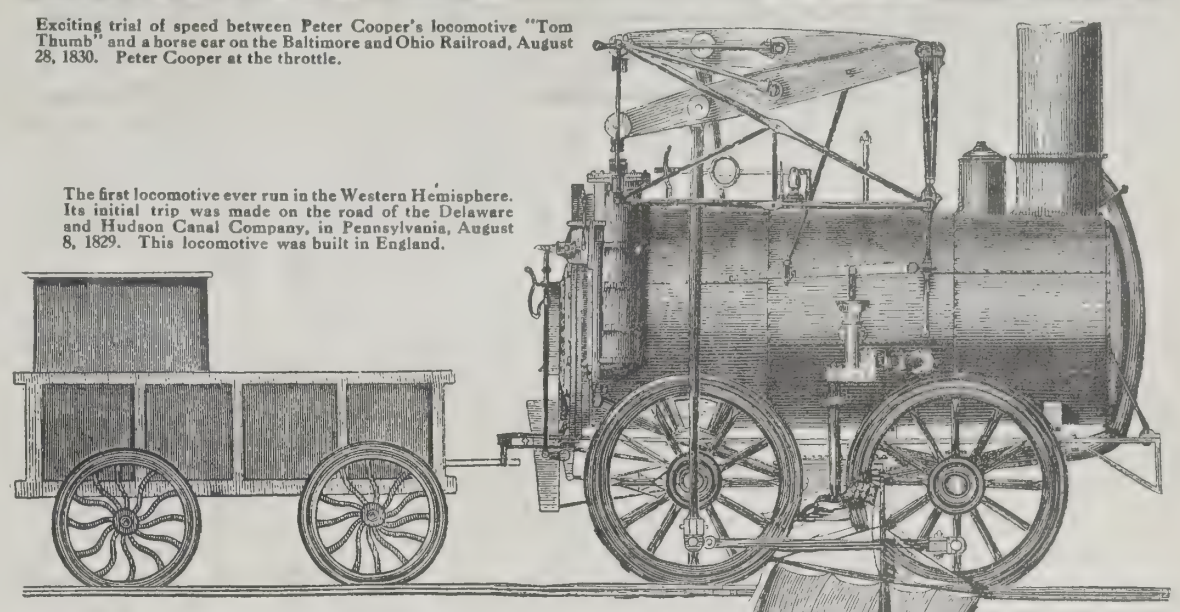
The first American-built locomotive for actual service upon a railroad for the hauling of passengers and freight was built in New York City for the South Carolina Railroad. (The reader will bear in mind that while the Cooper locomotive was the first one built in this country, it was only a light model for experimental purposes.) This engine was named "The Best Friend of Charleston." The Charleston *Courier* of January 17, 1831, contains this account of the first trip:

"On Saturday last, the first anniversary of the commencement of the railroad was celebrated. Notice having been previously given, inviting the stockholders, about one hundred and fifty assembled in the course of the morning at the company's building in Line street, together with a number of invited guests. The weather the day and night previous had been stormy, and the morning was cold and cloudy. Anticipating a postponement of the ceremonies, the locomotive-engine, 'Best Friend of Charleston,' had been taken to pieces for cleaning, but upon the assembling of the company she was put in order, the cylinders new packed, and at the word, the apparatus ready for movement. The first trip was performed with two pleasure cars attached, and a small carriage, fitted for the occasion, upon which was a detachment of United States troops and a field piece which had been politely granted by Major Belton for the occasion.

"Upon the return of the engine, it was found necessary to tighten the packing, which occasioned some little delay. At about one o'clock she again started with three cars attached, upon which were upward of one hundred passengers. At two o'clock a Federal salute was fired by the detachment of troops stationed upon the remains of the fortification erected during the Revolution near the Quarter House. At four o'clock the company commenced returning, and were all safely landed at Line street before six. The number of passengers brought down, which was performed in two trips, was estimated at upward of two hundred. A band of music enlivened the scene, and great hilarity and good humor prevailed throughout the day."

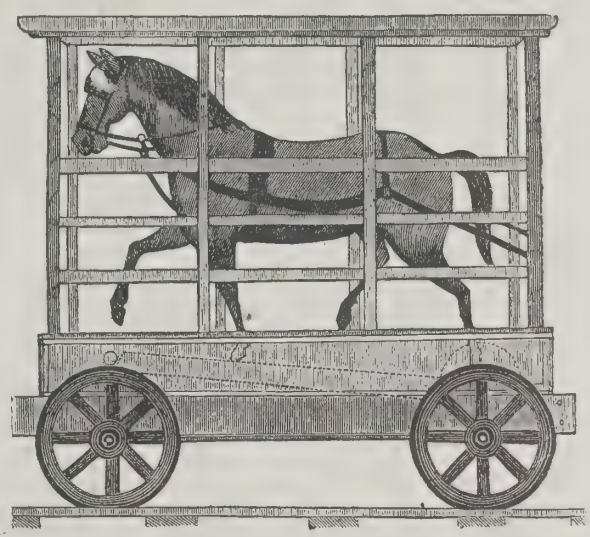
The second American-built locomotive was also ordered by the South Carolina Railroad. This one was named the "West Point."

The officials of the South Carolina Railroad were the progressive hustlers of their day. They put into service the first eight-wheel locomotive in the world. This engine was designed by Chief Engineer Horatio Allen, of the South Carolina road. Many years afterward he explained the necessity for this innovation in the following letter to a friend:



"I had early come to the conclusion that to make the locomotive the instrument that would be required, it must furnish more power in one instrument and one engineer; that it was plain that the materials, and that, too, of the road which carried the locomotive, limited the weight to rest under each wheel, and that, as more power required more weight, there must, of necessity, be more wheels, and that, if more wheels are required, power must be made in reference to curves and change of grade. In reports made in 1830-1831, I set forth the combinations by which such provision could be made. At that time the locomotives in England were all on four wheels, and it was maintained by a strong English influence that it was not for us, in America, to depart from English usage. The subject was a matter of discussion for a winter. I took the position (English usage to the contrary notwithstanding) that no long road for general passenger and freight purposes could maintain itself without the use of eight-wheel locomotives, and that probably ten-wheel locomotives would also be found desirable. Experience has amply sustained my position. My efforts were successful, and in 1831 the first eight-wheel locomotives were built on my plans and under my direction. The combinations by which provision was made for curves and changes of grade are substantially those so generally used on eight-wheel locomotives and eight-wheel passenger cars.

"It is of some interest that their introduction, without patent, was in a great degree the means of saving the railroad companies and the public from charges for their use."



The first locomotive in the state of New York, and the third built in America, was called the "De Witt Clinton," and was operated on the Mohawk and Hudson Railroad. It made its first run on August 9, 1831.

Exciting trial of speed between Peter Cooper's locomotive "Tom Thumb" and a horse car on the Baltimore and Ohio Railroad, August 28, 1830. Peter Cooper at the throttle.

The first locomotive ever run in the Western Hemisphere. Its initial trip was made on the road of the Delaware and Hudson Canal Company, in Pennsylvania, August 8, 1829. This locomotive was built in England.

Horse power locomotive used in the early days of the Baltimore and Ohio Railroad.

The Farmers Make Known Their Demands

Concluded from page 12

ing to get legislation for a better financing of livestock industry and personal rural credits. It desires to have the Federal Reserve Board vested with proper authorization so to classify rediscounts that primary production may be given prior consideration. It also asks that profits from the Federal Reserve Banks constitute a revolving fund in such amounts as may be necessary to provide the working capital during the time of the receiving of the requests, and the sale of debentures. It also advocates that all debentures be eligible for sale in Federal Reserve Banks or on the open market. An effort has been made to have the maximum limit on Federal Land Bank mortgage loans increased from $10,000 to $25,000.

"The farmers of the Middle West for years have been interested in packer and stockyard control legislation. The American Farm Bureau Federation has presented its case to the House Agricultural Committee upon numerous occasions. At this time the Haugen bill is being considered by the House. It places the supervision of regulation under the Secretary of Agriculture which will avoid the twilight zone that frequently develops where one department of the government ceases to function and another takes up the work. It arranges for publicity of accounting and puts definitely upon the courts the power to enforce any complaint orders issued.

"For some time the Federation has been interested in the famous dam project at Muscle Shoals, Alabama, started during the war for the manufacture of nitrates from the air for munitions. Until then this country had not awakened to the fact that air affords our only source of steady commercial nitrogen in large volume. We had been depending almost entirely upon Chili for her deposits of sodium nitrate and it is from this source that most of our nitrate for commercial fertilizers is obtained. During 1918 and 1919 we imported about $70,000,000 worth of sodium nitrate annually and paid an export duty of $16,000,000 to $20,000,000. Before the war we relied upon her to furnish $16,000,000 to $20,000,000 worth and paid her a duty of $6,000,000 to $7,000,000.

"A committee of the American Farm Bureau Federation recently visited Muscle Shoals and unanimously recommended that the Government finish the dam to operate the nitrogen plant under its rights and that a Government corporation be created to direct the operation of the plant for making fertilizers and in case of need to supply the War Department with a cheap source of nitrates.

"Another bill which is of great importance to the farmers is the Tincher bill regulating the trading in grain futures. The Farm Bureau has given a great deal of testimony before committees in Congress on this subject and advocates abolishing speculative future trading and safeguarding legitimate transactions involving insurance features such as hedging. The Tincher bill as drawn should curb speculation for it taxes it so heavily as to make it prohibitive.

"There are many other items in the Federal legislative program in which the membership of the American Farm Bureau Federation is interested, but in all questions the general public—the consumers—are vitally interested with the producers."

UBANA ILL

BRIEFLY TOLD

A one-hundred-thousand-dollar exchange building in Wichita, Kansas, is threatened with destruction by hordes of ants, driving upward from the earth through mud tubes. Oaken lumber stored under the building has been practically consumed and the ants have tunneled as far as the second floor following pipe lines. Fly paper placed in the path of the ants was bridged with dirt by the insects.

A special issue of airplane service stamps of 15, 30 and 45-cent denominations has been prepared by the Chinese post office department, in anticipation of the air transmission planned for the near future in that country.

A green parrot swinging in a tree in Evanston, Illinois, jammed traffic for blocks by calling out, "Not so fast—go slow! Stop!" The same squad of officers who captured the parrot rounded up an organ grinder who had a monkey trained to climb into second-story windows and pass out articles of value. When captured, the monkey had a valuable vase and lavalliere which he had stolen from a bedroom.

Prehistoric Mexico was occupied and colonized by Chinese, according to archeologists whose researches have resulted in discoveries of incense burners and peculiar three-legged dishes made only by the Chinese.

An Eastern circus organization will tour the country this year in motor trucks costing from $12,000 to $30,000 apiece. It is estimated the saving in rail charges will go a long way to pay for this equipment. The motorized circus will be able to travel anywhere and, being independent of train service, may make towns not often visited by large shows.

Ten thousand Chinese entered Mexico through Pacific Coast ports and Guatemala during 1920.

A twelve-foot boa constrictor, a stowaway from some tropical port, recently arrived in New York Harbor where he was stunned by a fall caused when the Hoboken workmen tore away his resting place. He was boxed up and sent to the zoo. Floods have been prevalent in the tropics and it is thought he crawled through a porthole from a drifting tree.

All doctors and dentists entering Mexico must pass an examination. Those who have been practicing three years in that country may continue, provided they register diplomas from foreign institutions of good standing.

In the Cambria coal field of Wyoming small quantities of gold and silver are present in the coal veins. In South Africa a similar occurrence has been noted, the coal occurring in small seams running through the quartzite ore.

A dust storm recently blew for thirty hours carrying Gobi Desert sand to Shanghai and far out to sea. Japanese liners arriving at Yokohama found it difficult navigating, owing to the heavy yellow cloud enveloping them. During the blow, Peking resembled a deserted city, for nobody ventured out except under stress of necessity.

Following the injury of eight freshmen and sophomores who were cut and burned recently in a class battle involving about one thousand students, all forms of hazing have been abolished by the student body of the University of Wisconsin.

The Colorado catastrophe is a reminder that among the greatest floods of history were the tropical hurricane at Galveston, Texas, that in 1900 lifted the waves from the Gulf many feet above the high-tide level causing a loss of 8,000 lives; that caused by the breaking of a dam at Johnstown, Pennsylvania, in 1889, with thousands of fatalities; the flood at Hoangho, China, in 1853, and a tidal wave in Bengal in 1876 which drowned 200,000 people.

A Philadelphia man lost his life recently while attempting to chloroform an aged pet cat. The cat scratched and struggled as he tried to administer the chloroform. The fumes became so dense the man fell unconscious and died. The cat escaped!

Help came from the skies when a man walked off the sea wall recently into the Potomac River. The pilot of a seaplane five hundred feet in the air saw him plunge into the water and swooping down enabled his companion flier to drag the drowning man to safety.

In the belief that prisons are too comfortable to serve as threats to those of criminal tendencies, a justice of the Brooklyn supreme court advocates the judicious use of the lash in certain cases.

Stockmen are exterminating the few remaining herds of wild horses which still roam the high ranges of Arizona, New Mexico, Southern Utah and Oregon. Wild horses are a menace to the domestic stock when turned out to pasture on the range. They consume fodder, break down fences and lure valuable animals from ranches. Expert rifle shots are engaged to hunt down these wild horses.

Airplane police to regulate traffic, patrol the lake front for persons and vessels in distress, assist in hunting bank robbers and automobile bandits, and to perform various other duties, will be added to the Evanston, Illinois, police department.

A bronze statue representing Victory, and designed to commemorate the heroism of Australian soldiers, laid for over a year, dust-covered and forgotten, in the yard of the Federal Parliament House. The unfortunate oversight has been rectified and Australia's thanks have been sent to the sculptor.

It is now possible to send a crewless vessel as far as radio impulses will carry. The same means can be used in sending a giant torpedo against a foe regardless of how far distant the enemy might be, provided he is within reach of the radio. In vessels the device is attached to the fuel engine, the water engine and the steering mechanism making it possible to guide, fuel and water by radio.

Rhodesia, under the administration of the Chartered Company of South Africa, is the most lightly taxed portion of the British Empire. Nevertheless the community has expressed a desire for the recognition by the Imperial Government of the status of a self-governing dominion, even though it would involve the payment of a debt of four million four hundred thirty-five thousand pounds.

Among the eight hundred and forty members of the Northwestern University graduating class is a blind student who worked his way through.

The lowly corncob can be made into many useful articles, due to a set of discoveries made in the Bureau of Chemistry of the Department of Agriculture. After a high-grade adhesive is removed, pure cellulose, a very good quality of paper and valuable lime products are recovered from the residue.

One-half of our citizens who are eligible voters fail to vote.

In the belief that a wife's place is in the home and not in the schoolroom, the Chicago school board has dismissed all married teachers and replaced them by single women.

The curb market in New York will be no more after July 10 when the New York Curb Brokers' Association will move into their newly erected building. Thereafter all trading will be done indoors. Thousands of sight-seers will remember the mad throng which for thirty-five years operated on the actual curb in Broad Street.

The Passion Play is to be revived at Oberammergau in 1922 when it is planned to give thirty performances. Eighty-two men, formerly actors in the play, were killed during the World War.

The probation method of dealing with juvenile delinquents in New York costs only one-eighteenth as much as institutional care.

During one hundred and forty-five years, the United States has been engaged in 110 wars or military expeditions.

Certain natives of South Africa brew a drink which reverses the motor nerves, causing drinkers to walk backward. The liquor is made of the fruit of the cashew tree.

Two out of every three persons in the world are unable to read and write, and one billion of the billion six hundred million persons in the world are non-Christians.

Ever since his midshipman days, King George has been collecting postage stamps. He is the only monarch sufficiently interested in this pastime to have a special official in charge of his collection.

Gold and silver in small quantities have been discovered on a farm in Iowa, according to reports from a Chicago assayer. Certain sections of the country along the Des Moines River are underlaid by ore-bearing gravel beds.

Uncle Sam Lends a Hand to Improve American Standards

THE war has emphasized the importance of public-health work. England, Canada and Australia have recently established ministries of health, thus recognizing that the care of the public health is one of the most important functions of a government. After the war emergency passed, the Public Health Service of the United States formulated a program to meet pressing needs.

The figures resulting from the draft showed that one-third of all of the men presenting themselves for examination were not physically fit to fight, due to defects a large proportion of which were preventable. The importance of this fact cannot be overestimated.

This unsatisfactory condition of the public health, persisting in spite of the emergency work of many health departments and voluntary agencies, indicates clearly that health work has not received the attention that it merits from governmental authorities. While preventable disease rates have been lowered in many cases, and campaigns against isolated diseases and unsanitary conditions have met with success, there has been hitherto no national campaign dealing with public health in all its phases.

Our government, however, is making an organized effort to improve the standards of health in the United States. The Public Health Service is charged with this important duty, but the success of its work depends largely upon the active co-operation of Federal, state, and local health authorities and voluntary organizations. Practical experience has proved that the proper co-ordination of public health activities can best be obtained under the Federal aid extension principle.

Not Much Money Voted

THE protection of the health of the public, including the encouragement of adequate health organizations in all states and localities, must be given serious consideration. While the appropriations that Congress has placed at the disposal of the Health Service are not large, valuable results are being obtained. True economy suggests and warrants additional appropriations, especially for use in rural health work, and which could be used with a high degree of effectiveness and in entire consistence with our principles of government, for nation-wide promotion of human health, and would yield to the national welfare a dividend second to no other obtainable from investment of Federal funds.

The program of the Federal Health Service is a comprehensive one. Its investigations have included the diseases of man, industrial hygiene, child hygiene, railway sanitation, rural sanitation, municipal sanitation, sewage disposal and public health organization. It has begun campaigns against malaria, tuberculosis, social diseases, and diseases of infancy and childhood.

While 7,000,000 people suffer annually from malaria, while one-third of our men of military age are unfit for military duty, and while a disease such as influenza can sweep across the country and kill 500,000 persons in the course of a few months, it is evident that there is a crying need that more attention be paid by the Federal Government to the problems of public health. Where measures for meeting these problems are now known, encouragement should be given to state and local health authorities in carrying them out, and the public should be reached by health educational measures on the part of the Federal authorities. Where such measures are not known, opportunity should be had for continuing on a much larger scale investigations which the service already has in progress, as in the field of child hygiene, the treatment of leprosy, studies as to cause and prevention of pellagra, combating the spread of trachoma, malaria surveys, and so on.

Among the new activities successfully established last year was the inauguration of a daily health column supplied for publication in newspapers throughout the country. Combined with a system of questions and answers, this has met with a very cordial reception by the public and has been an effective vehicle for the promotion of public health education.

Treating Leprosy Successfully

AMONG the interesting results secured during the last year or two is the apparently beneficial use of a preparation of chaulmoogra oil in the treatment of leprosy. It is too early to know positively whether treatment with this oil is a permanent cure for the disease, but under it a large number of patients have become bacteriologically negative and have been allowed their freedom. With the early operation of a national leprosarium the development of this treatment offers great promise for the relief of patients and possibly for their cure.

In no time in the history of the segregation of lepers in the Hawaiian Islands, extending over half a century, have there been so many voluntary surrenders as during the last two years. This is in striking contrast to the almost universal custom in the past of enforcing the segregation laws through direct arrest by deputy sheriffs. The old prejudice on the part of lepers against segregation and their disbelief in any remedial measures on their behalf has been slowly but surely overcome during the past few years through various agencies. Today the medical attendant enjoys the implicit confidence and hearty co-operation of his patients.

Let us consider malaria. This is a thoroughly preventable disease, for if malaria-bearing mosquitoes were eliminated there would be no malaria. Yet there are seven or eight million cases of malaria annually in the United States, causing a heavy economic loss to the country. Malaria fevers cause an annual loss of efficiency each year in our country that is appalling and the communities that suffer lack interest in public welfare. In many villages from ten to forty per cent of the inhabitants are infected. Where such conditions obtain the community cannot and does not progress or develop normally.

Through the activities of the Public Health Service active anti-malaria measures are now being undertaken in scores of communities. It is encouraging to note that there is a strong demand for state and county aid for the campaign of malaria eradication, and that such support has already been given and has the approval of the public. What is also important is that a large part of the public now realizes that it costs much more to continue to suffer and support the financial loss caused by malaria than it does to eliminate the disease from their community.

The studies of the service in regard to the cause and prevention of pellagra have been continued. Previous researches by the service have shown that this disease is due to an improperly balanced diet, and now attention is being directed toward the discovery of the precise dietary faults which bring it about.

It is now known that pellagra is not infectious and is not caused by eating spoiled corn. From the point of view of prevention, the knowledge that the disease can be avoided by the consumption of a well-balanced diet, including plenty of fresh meat, milk, and green vegetables, is the important fact. Pellagra has decreased in the South, owing to better economic conditions, but a great need still remains for popular instruction as to the means of preventing this disease and for a continuation of field studies bearing on the matter.

Trachoma—a highly communicable disease of the eyes, frequently resulting in blindness—has likewise been dealt with by the Health Service, which maintains a number of hospitals at which operations for the cure of the disease are carried out. As a result, trachoma has been eradicated from a number of districts where it was previously prevalent. In connection with a study of it, a surgeon was detailed to investigate the possibility of an animal scar-tissue conjunctivitis of insect origin etiologically related to trachoma. The results uncovered no evidence in support of the hypothesis that biting flies and equine conjunctivitis are agencies in the etiology of trachoma.

The Outbreak of Botulism

ONE of the subjects actively studied very recently, and which has aroused the attention of the public, has been the outbreak of botulism, which caused a few deaths, from the eating of bottled olives. The main object has been to find out the cause of old and recent outbreaks; whether it was due to vegetables or method of canning; contributory factors, as soil, insects, hog carriers; clinical manifestations, treatment, recovery; complications, if any. As to limberneck, investigation of the disease has been directed toward spoiled home-canned goods.

One of the most important features of the work of the Scientific Research Division and one which has been developed almost entirely in the past year and a half was an investigation in the field of child hygiene. This work was undertaken from the point of view of assisting the states in the establishment of child hygiene departments.

There is hardly a question before the country today which is so important as that of child hygiene, including as it does prenatal care, infant welfare, and personal hygiene prior to school age. How many know that approximately eighteen thousand mothers died in this country in childbirth in one year? How many know that one in every ten children born alive in the registration area of the United States during the year 1918 died before reaching the age of one year? How many know that approximately one-fifth of all the deaths which occurred in the United States during the last year were of children under five? And has it ever been realized that practically seventeen million children of school age in this country are without medical supervision?

Industrial hygiene is also being studied carefully. The Public Health Service is studying intensively certain trades and occupations, the occupational diseases incident thereto, and the means for their avoidance. The establishments investigated include such diverse industries as metal refining, production of bakelite, pottery, sanitary ware, tools, tile, brass and gray metal castings, sheet lead, motors, machinery, steel, cable, munitions, asphalt paving materials, chemicals, flour, paper, cigars and tobacco, clothing, shoes, corsets and other products.

In addition, consulting service has been given to about one hundred and twenty-five state and municipal health and labor departments, industrial establishments and other groups interested in various phases of industrial hygiene and sanitation.

The Public Health Service has been bending its energy to the problem of giving rural districts the same degree of health protection which is enjoyed by our large cities. Life in the country should be healthier than city life, but because of poor sanitary conditions and lack of health organizations and even lack of interest by the people themselves, it is attended by many dangers due to the inroads of preventable diseases. Stream-pollution, sewage, self-purification of streams, suggestions for practical and inexpensive or uncomplicated improvements—the service has dedicated its attention to all these subjects. It has even gone so far as to study trade wastes, and evolve methods which make it possible for industries to dispose safely of their wastes.

The Division of Venereal Diseases of the Public Health Service is a very recent creation, but a very important one. Its work has been organized on a three-phase program, including medical measures, educational measures, and legal measures. The work of the state boards of health has been more thoroughly organized. They have taken over all of the detail and follow-up work and generally have assumed greater initiative. Congress appropriated one million dollars to be allotted to state boards to facilitate their co-operation with the Public Health Service in this important phase of hygienic work. This fund has been distributed, and at the present time there is a fully-organized bureau at work in every state except Nevada.

In securing the co-operation of industrial and commercial groups, employers have been shown that there is a definite relation between social diseases and lost time, efficiency, delayed recovery from minor accidents, prolonged compensation, unsafe practices, costly accidents involving loss of life, labor turnover, and falling off of production. To increase the efficiency of their employed force by facing this problem frankly, employers are urged to include in their medical service free examination, diagnosis and treatment, and to introduce educational preventive measures, such as lectures, exhibit and film showings, pamphlets and placards—activities that are intended to be self-supporting. A total of 1,697 industries, representing an employed force of 609,335, have been interested in this educational work.

Medical Examinations Impaired

DUE attention, of course, is being given with regard to the spread of communicable diseases. The ideal prevention of epidemics should be based upon early reporting of cases; that is, reliable, prompt morbidity reports. To prevent the introduction into this country of yellow fever, Asiatic cholera, bubonic plague, typhus fever, and other quarantinable diseases, the Health Service administers the national quarantine laws. As a further protection against the introduction of diseases in the United States, service medical officers are attached to the immigration stations, for the purpose of making medical examination of all arriving aliens.

Last year 15,500 vessels and 838,328 passengers and crews were inspected at the continental maritime stations. At border quarantine stations more than 90,000 travelers were inspected exclusive of local interurban traffic.

The total number of aliens certified was 25,109. Of this number, there were certified 734 for tuberculosis or mental conditions, 5,216 as being afflicted with either loathsome, contagious or dangerous contagious diseases, 14,810 as having conditions that affected their ability to earn a living, and the rest for minor defects.

But the medical examination, especially at the larger ports, was seriously impaired in its efficiency by a number of conditions that should be remedied. The transportation facilities for enabling the examiners and inspectors to board incoming vessels is wholly inadequate. To compensate for lack of transportation the service necessarily has to assign additional medical officers, with resulting waste of administrative effort.

The medical examination of alien crews for immigration purposes has to be performed under conditions that are not wholly conducive to efficiency. It is necessarily a hurried procedure and attended with a lack of equipment for a thorough physical examination, with no privacy, and the result is far from perfect.

It is to be hoped, by the way, that some legislation will be secured, providing a penalty against steamship companies in cases where diseased alien seamen are discovered. Such a penalty would act as a deterrent against the employment of diseased persons in the same way as the penalty clause now provided in law acts to minimize the importation of diseased immigrants.

Handling the Typhus Louse

THE service took action, through proper channels, to effect the revision of the sanitary convention of Paris of 1912. This was deemed advantageous because with the cessation of hostilities in Europe and the resumption of maritime commerce, the danger of introduction of epidemic diseases into the United States increased.

Typhus spread throughout Continental Europe by means of returning soldiers, repatriated prisoners and, to a less extent, by commercial travelers. At present officers of the service are stationed at practically all of the important ports of Continental Europe for the purpose of inspecting vessels and personnel prior to their departure for ports of the United States. Notwithstanding all precautions, however, typhus has broken out on several of the vessels, but with the detection of the disease on the arrival here and the appropriate treatment at quarantine stations, the efforts to prevent the introduction of typhus from Europe have proved entirely successful.

The Public Health Service, in conclusion, is at all times ready to co-operate with the people of the United States in any case in which it can be helpful. Pamphlets and instructions have been distributed by the tens of millions.

The strongest recommendation is that the appropriations for the service should be adequate enough to meet the needs of the national health program, in order that constructive work along every possible line may be carried forward uninterruptedly and satisfactorily.

The Language of the Train Whistle

By HOMER KINGSLEY

This is the first of several stories on interesting facts having to do with the operation of a railroad. The next will appear in an early issue.

(C) Boston Photo News

Before the engineer receives his signal to go, he goes carefully over his engine to see that everything is all right. Oftentimes he himself will oil up. He does not wish to be delayed on a long run by a "hot-box" which comes from overheated bearings.

ENGINEERS, conductors, brakemen, firemen, have a language all their own. It is a foreign language as far as the general public is concerned. It is not a spoken language, unless the nerve-shattering screech of the engine can be called speaking. It is by means of whistles that the trainmen receive their orders and know just what to do.

For instance: We stand on the platform of the railway station ready to take the southbound local. As we hear our train giving one long blast in the distance we see the smoke of the northbound train. It seems to be about the same distance from the station as our train. We wonder which train will reach us first. As the tracks are such that one must come in ahead of the other in order to discharge its passengers we speculate on which one it shall be. Will they both try to make it? Will they both slow down expecting the other one to go on? Will they politely stop and do a sort of Alphonse and Gaston act while the engineers and conductors implore each other kindly to proceed first?

But they never have any difficulty in this way. There are whistles as they both near the station, and one will come in and the other will wait down the track until the first one is in motion, and then politely and considerately take its turn.

It is in just such places as these that the language of the whistles is used to good advantage.

The whistles as given were like this. One engineer gave two short blasts of his whistle (—— ——) which said "proceed." The other engineer, understanding, acted accordingly. But two long whistles would mean an entirely different thing (—— ——), release the brakes. The distant whistle of our southbound train that we first heard, one long (——), was the signal used when approaching a station or regular stop.

Ever ride in the cab of an engine? No? Then you have missed one of the thrills of life. To the mere passenger who is used to "riding the cushions" in the parlor car there is an absolutely new sensation in sitting up in the cab of one of the greyhounds of the road and relaxing to the swing and roll of the mighty iron brute that eats up the miles, poking its nose along by running streams, through dark tunnels, across dizzy trestles, through smiling villages and finally into the terminal at the end of the run.

But no little of the excitement is in the stentorian means of communication maintained by the conductor, engineer and trainmen. "Climb up there," shouts "Big Jack," as he takes a good look at our permit. And with a little assistance we do. We settle ourselves comfortably on the fireman's cushioned seat. He is busy most of the run shoveling coal, except in the regions where oil is used.

We are ready. Big Jack is leaning out of the window. Suddenly we hear a sound like escaping steam or air. It goes sss, sss, sss, sss, four times. It is the air whistle up in the top of the cab. The conductor or brakeman back in one of the coaches is pulling the rope that runs along the top of the passenger car. Four whistles when the train is standing still is the signal asking our engineer to test out the air brakes. This is commonly called for as the train is about to leave a division point.

After the air brakes are tested out, and everything is all ready, the final signal is given, and we gather momentum as we leave the station. The fireman shovels coal into the firebox, Big Jack is busy watching the signals and semaphores along the track and we rattle over switches and leave the yards on to the straight track.

What's that? Our engine gives a long whistle and two short ones. Just then we come up to a train on the siding. The engine of the siding train answers with two short blasts followed with one long and two short, and Big Jack jerks the whistle cord to the tune of two short jerks.

We wonder what it all means. Trying to catch the words we learn that the one long and two short said that there was another section to our train and to stay on the siding until it passed or to look out for it. When the engine on the siding gave two short whistles it meant, "Yes, we understand," and so to be pleasant Big Jack gave two short ones too. This particular signal, the two short, is used to answer any signal not otherwise provided for in the rules.

There are certain definite rules that the engineer must learn. At the present time all of the chief roads in the United States use the same signals. It is said that they all pay a royalty or rental right for the privilege of using this system.

Now we are on the go. It's a straight-a-way track, and Big Jack makes time. If we are riding in one of the Pacific Type moguls we will bounce and roll about until it seems that we will surely slide off the track. But, no danger. Our engine is built for speed and we make fast time.

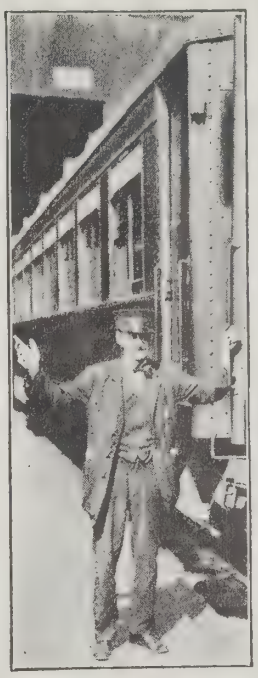
We look out of the window while the wind rips through our hair and stings our faces. We feel the engine slow up a little. Away down ahead of us there is a cow wandering alongside the track. The old whistle ought to make bossy's ears deaf for a month as it goes in repeated short sharp staccato blasts, keeping it up until the gentle-eyed bovine decides to try the grass along the fence.

To run over a cow is not a safe thing to do, even though equipped with cowcatchers. Sometimes bossy will not bump out of the way easily, may decide to roll under instead. One wreck on the Pacific Coast division was caused by a freight train that hit a peaceful looking mulcy-cow. Bossy rolled under the cowcatcher and stayed nestled down between the rails until several cars had passed over her. Then for some unknown reason, perhaps a hot-box tickled her, she wiggled about and in front of a set of wheels.

Promptly twelve cars were piled up all over bossy and on both sides of the track. So badly wrecked were they that it took a crew two days of continuous work to clear the track. It is better to make the welkin ring than to take chances.

Now we come to an important station. Big Jack gives four short whistles. This is the general signal, used in this instance in calling to the operator asking if there are any orders for him. If the station man has no orders he will pull the right arm of the semaphore down. If he has an order, he will leave the arm extended, the signal to stop.

Again we make time. The two steel rails bend and stretch out ahead as far as we can see. Now there is a man ahead with a square yellow flag, and the air brakes are applied. The man with the flag is on the right-hand side of the track which means proceed slowly. Our engineer says one long and two short and one long, meaning that the signal is heeded.



A little farther along is a brakeman holding a red flag. Big Jack gives two short, sharp blasts and stops. Then almost immediately we hear one long and three short which is the command to the rear-end brakeman to take his flag and signals and torpedoes and go back down the track for four hundred yards and protect the rear end of the train from any possible train that might collide into it from the rear.

We learn that to stop in this way means that there is a wreck ahead or trouble.

At last when our track is again clear and all is safe, the signal is five long pulls of the whistle which means for the rear-end brakeman to hustle back on the run for the train is going. Four long ones are used for calling in the brakeman from the south and west and five long ones mean the same thing to those who are called in from the north and east.

There are but two directions in railroading: north and east is east and south and west is west.

The hot-box has made us late, and now Big Jack is opening the throttle wide. We are "hitting it up" at a lively pace. Perhaps the conductor doesn't like the speed and signals with the air whistle four short hisses. That means to run slower—to decrease speed. If it had been five times it would have meant to increase the speed. Big Jack repeats these signals with the steam whistle as an acknowledgment.

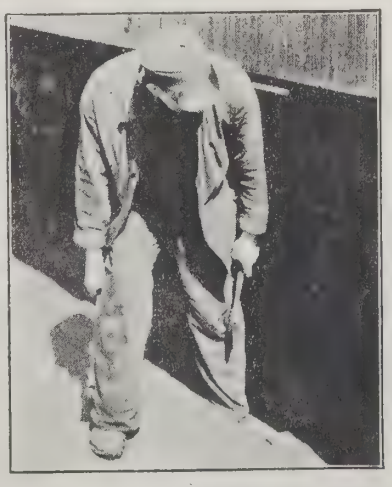
(C) Boston Photo News

The conductor is the commander-in-chief of the train from the time it leaves the station. He gives the signal to go, sometimes called the "highball." He receives all the train orders at the different stops, takes tickets and is the final authority.

There is a station ahead. The switch lights are all right and there is someone raising and lowering a white light. That means "come ahead, everything is all right." Our engineer answers with two short. This lantern signal has been given because there is a train on the siding nearest the station.

We cross and recross tracks. Our fireman and engineer are closely watching every light and every signal. At many of the terminals the semaphores are "set against" them. That is, they are to whistle for their signal, for they are up. This is a precaution against danger. The train proceeding slowly gives four short whistles. If the arm goes down in answer to his whistle the engineer answers with two short blasts. If the arm stays up he will answer with one. The latter means that the train is to stop and receive further orders before proceeding.

These are the chief signals used on the railroads of the United States. They may sound complicated but they are simple. No trainman is excused if he forgets or disregards them for your life and the safety of property depends upon perfect attention.



Summarized they are as follows:

Engine whistles: one short, danger, stop at once. One long, approaching station or regular stop. Two short, "Yes, I understand," answers any signal not otherwise provided for in the rules.

Two long whistles, release brakes; three short while trains are standing, back up; three short while in motion, stop at the next station; three long, while in motion, train is parted; four short, calls for a signal where one is missing or not understood.

One long and two short, notifies meeting trains that you are displaying signals for a following section. Two long and two short is approaching road crossing. One long, two short and one long, run slowly. One long and three short, flagman go back and protect the rear of the train. Three short and one long, flagman go ahead and protect head of the train.

Four long blasts, calls flagman in from south and west. Five long blasts calls flagman in from north and east. Two short, given in series like this —— —— —— —— —— means the air brakes are sticking. A signal given like this —— —— —— —— is for second engineer to assist in recharging the air brakes.

(C) Boston Photo News

As a train comes to a stop in the terminal and before one goes out an inspector looks over every car to see that the brakes, springs, journal boxes and other parts of the running gear are in order. Since the days of the steel wheels the car wheel "knocker" has gone out of business. In the old days he tapped the wheels to find a crack or flaw by the sound.

France and Anglo-American Unity

ONE striking result of the resumption by the United States of a place in European councils has been a sudden subsidence of the menace to world peace involved in the Silesian rising. The possibility of a split between France and Great Britain, of which the clash between the respective policies of these governments regarding Poland was generally felt to be the entering wedge, seems to have been entirely dispelled, at least for the nonce. For this the hopes awakened in both countries of an American alliance, and with it substantial aid in territorial settlements that shall be satisfactory all round, would seem to account.

The Paris *Journal,* usually credited with a semi-official character and wielding at any rate the influence inseparable from a daily circulation of more than two million copies, offers much possible enlightenment on the whole situation. In a recent issue, the *Journal* declares that France will "accept with joy England's offer of an alliance"; but would "regard with equal approval an alliance with the United States."

So pointed is this expression of a lively hope for the development of the suggested Franco-British alliance into a triple bond including the United States, that one wonders on what it is based. Was the widespread opinion on this side the Atlantic that the eloquent and astute Rene Viviani returned empty-handed from his recent mission to Washington, despite the yeoman's assistance of that prince of publicity men, Stephen Lausanne, a mistaken opinion?

There can be little doubt that Viviani sought to obtain from President Harding pledges favorable to an economic if not a military alliance with France. Did he succeed?

Foreseeing the breakdown of the League of Nations consequent on its scrapping by the new Administration—and probably quite sympathetic with such scrapping—the French premier undoubtedly found it wise to cast an anchor to windward. American sympathy with British and Italian opposition to the occupation of the Ruhr and the sanction of Korfanty certainly had a deterring effect on French militaristic plans and policies. Balked of her plans for control of the Ruhr and Silesian coal-fields incident to the advantages of barriers against possible German aggression on the west and Bolshevism on the east, France was forced to seek other safeguards for her national security, undoubtedly her great and anxious concern.

M. Briand, probably coached by Millerand and Viviani, has been keen enough to see that the one hope for preventing a tipping of the European balance of power in favor of Britain and against France would be the throwing into the scales of the tremendous weight of American influence in the rôle of moderator if not arbitrator. Indicative of this change of front are the following extracts from the *Journal's* editorial:

> It is hardly necessary to say that any proposition from England for a military and political alliance, if conceived on a footing of absolute equality, will find on this side of the Channel a welcome at once impressive, cordial and joyous; above all, if such a proposition should promise to become the nucleus of a still larger agreement and one not limiting itself solely to European friendships.
>
> Neither France nor England were the sole victors: It was America that decided the conflict in their favor. On the morrow of the war's close, all eyes were turned toward the three nations and it was universally felt that the re-establishment of world peace waited on the union of all three in one strong alliance. It was in this spirit that the famous Anglo-Franco-American pact of guaranty was concluded.
>
> For reasons unnecessary to recall, that pact has remained so far simply a project. . . A dual alliance will not replace the contemplated triple alliance. Such a dual alliance cannot have for us the importance it should have unless it is permitted us to hope for the accession to the alliance in the near future of a third partner. If, however, it is concluded with the firm support and warm encouragement of that third partner, no one will have the faintest reason for suspicion that it will risk a separation of the cause of France from the cause of America, or of some day finding the two great democracies of the world ranged in opposing camps.
>
> Europe can do nothing without the Entente between France and England; but the world itself can do nothing without the collaboration of America. It has been said that a Franco-British alliance would be the cross-beam on which Europe would rest. That is true; but a cross-beam, however strong, to have lasting solidity must be supported on the joists of full confidence. And the joists of the world structure today are over there on the other side of the Atlantic, in the deep foundations of that nation of 120 million souls—the nation that is the most disinterested, most generous and most powerful on the planet today.

Making every allowance for Gallic effervescence and proneness to the superlative, these words certainly indicate a changed direction of the wind of national and international policy in Europe.

Mrs. Eddy's Centenary

CHRISTIAN Scientists the world over are making elaborate preparations for a dignified and impressive celebration on July 16 of the centenary of the birth of the founder of the cult, Mrs. Mary Baker Eddy. The occasion directs attention anew, and in the sharper perspective of time, to one who holds unique place among leaders in American life, as to the particular movement of religious thought in our time of which she was in a way the initiator and apostle.

In all ages, there has been witness among men to the metaphysical basis of life. The disciples of Tsao Lo in China, of Krishna and of Buddha in India, of Zoroaster in Persia, of Hermes in Greece, of the Essenes in the Sinai Peninsula, all in some degree recognized the therapeutic value of right thinking. Aeschylus, "Father of Medicine," laid more emphasis on the spiritual than on the physical factors in healing.

Summed up, as to its basic philosophy, in the Master's saying, "The life is more than the meat and the body than raiment," there can be no doubt that this spiritual healing was taught and practiced by the apostles and the early Christians. In essence, it had large place in the metaphysical teaching of the Christian mystics and "Quietists" of the seventeenth and eighteenth centuries and that doctrine of "the inner light" which was the inspiration of George Fox, founder of the Society of Friends or Quakers, as of the Pilgrim Fathers of New England. Theoretically Emerson and the Transcendentalists, who exerted so profound an influence on American thought while Mary Baker Eddy was still a young woman, taught the same philosophy and may be regarded, indeed, as the natural precursors of Christian Science and other "New Thought" schools.

It was not until the advent of Mrs. Eddy's book and the organization of her system, in the seventies, when she was already past middle age, that this metaphysical philosophy became something more than the speculative toy of the intellectual few, or the ecstatic rhapsody of the religious devotee. Until then it was decidedly caviare to the general. If to bring an idea down from the clouds and give it concrete and definite form with standing upon the solid earth is the mark of genius, Mrs. Eddy must be regarded as a genius. She made metaphysics work.

And one does not have to be a Christian Scientist to concede in all fairness to the teaching a marvellously wholesome influence. The average Christian Scientist is serene. He does not let his mind be troubled, and has due regard for the peace and quietness of his neighbors. He is optimistic and neither howls nor whines, and so "stays on the job and gets there." The marked success of the institution of which he is a member is apt to be reflected in his individual success. Christian Science has done much to make sickness, and the habit of complaining of sickness, unfashionable and to beget that quietness and confidence which leads to achievement.

Not Such a Bad World After All

EVERY little while the heart of man is cheered by contemplation of a single concrete fact that stands out eloquently luminous. What could be more challenging to the pessimism clouding a billiously tinted vision fixed upon business dullness, financial stress and worry, the ingratitude of presidents, the thanklessness of children, and the perfidy of politicians, than the news that we are to have an unprecedented crop of watermelons!

Evidence of the determination of southern farmers to diversify crops this season is furnished in reports from Texas of an enormously increased acreage planted to watermelons. Furthermore, "all conditions are favorable to large production." Of special interest to the consumer—the Enjoyer, let us say with anticipative rapture of the absorption by and by of the melon's generous, cooling and delicious juiciness—an efficient distribution of this melonic abundance has been organized.

If there is any answer to Lowell's question, "O, what is so rare as a day in June?" here it is: "A nice big watermelon, freshly cut through its axial meridian." How its rich redness of pulp, so harmoniously contrasting with the green and white of the rind, and the fleck of glistening black seeds, smiles up at one! "Here be richness," it seems to laugh. "Here be sweetness! Let your eyes rejoice, and your nostrils with your palate. Take me to your heart for refreshment of mind and body!"

For the man assimilating a watermelon, the world is surely in tune, the sky is a heavenly blue and the grass very green. Youth is renewed and life resumes its normal rose-color. All envy, jealousy, malice and uncharitableness vanish into their native nothingness and the future becomes bright with hope.

To the farmer, especially, this big melon crop brings kindly and convincing rebuke for pessimistic complainings. He will now literally "cut a very rich melon." For melons are more profitable than cotton at present price levels. Quick and satisfactory returns on shipments, we are informed, will be made possible by the organization of a co-operative marketing association on the plan that has proved so successful in the marketing of California and Florida fruits. The melon crop, in fact, is the silver lining to the dark cloud of the low cotton prices that hit the farmer so hard. It enforces for the future the wisdom of crop diversification.

So let the thermometer mount, and the politicians scheme and the Jeremiahs predict black disaster on disaster. There's melons a-plenty!

World Prosperity at Hand

THERE seems to be a general agreement among men best qualified to speak on the subject that an era of unexampled prosperity is at hand. In the opinion of Samuel Vauclaim, president of the Baldwin Locomotive Company, we may look for a revival of business activity on a large scale not later than the end of November in this year. Less precise as to date, but equally cheering, is Judge Elbert H. Gary's declaration to friends in the steel industry that, unless grievous mistakes be made, prosperity is not far distant. Judge Lovett, basing his expectation on conditions in the railway world, is convinced that a distinct revival of prosperity will be made evident immediately after the first of July.

All these prognostications of a dawning era of prosperity are based on an appreciation of the enormous natural resources of the country and a more active exploitation of these resources as soon as world economic conditions become stabilized.

It is difficult to see how one who even faintly realizes the magnitude of our natural resources, the extent and fertility of our agricultural lands, the petroleum wells within our own borders whose output runs into the billions of dollars annually, our rich iron ore and copper deposits, our wealth of forests and the cattle and sheep on a thousand hills and plains, to say nothing of our store of precious metals, can help being, in the phrase of the elder J. P. Morgan, "a bull on the future of the United States."

Nevertheless, we are forced by the logic of recent events to recognize that there is something lacking when—despite our marvelous richness in natural resources—experiences of industrial unrest and compulsory idleness, business depression and general scarcity and unrest, are possible. What is the missing link between our abundant natural wealth and its general realization and enjoyment?

Is it not to be found in a currency system that involves an unsocial control of credit, and in a blindly selfish greed that undervalues the vital importance to all of establishing intelligently *human* relations between employers and employed?

Mr. Ford's Page

IT IS rather a strange arrangement of nature that only the most precious values can be wasted. You can waste time, you can waste labor, you can waste material—and that is about all. You cannot waste money. You can misuse money, but you cannot waste it; it is still somewhere. You can waste your own opportunity to use it for benefit, but that is all. Which would seem to put money in at least the second class.

Time, energy and material are worth more than money, because they cannot be purchased by money. Not one hour of yesterday, nor one hour of today can be bought back. Not one ounce of energy can be bought back. Material wasted, is wasted beyond recovery. These things are in the front rank of values. They are the precious elements out of which all wealth is made.

It is worth noting that these precious values are not of human creation. We have done a great deal with our human intelligence and energy, we have accomplished much by the manipulation of natural material and forces, but the severely modifying fact remains that ourselves and all we have worked with, and the very intelligence we have worked by, were not our own creation. So, while mankind may be pleased, and even thankful, it ill becomes it to be boastful.

All our values were given us. Mind-values, power-values, material-values were all here. And we, the human race, have simply been cutting our eye-teeth on some of the elementary problems. The tree makes apples, mankind makes engines and philosophies—the tree cannot boast itself to be very original and powerful; it does what it was given power to do.

But mankind always has promise of being permitted to do still greater things. If trees bore different and finer apples every succeeding year, we should say, "Well, there is progress in the apple kingdom, and some day those apple trees are going to develop into beings of wonderful powers." But we don't see that. We see, however, mankind putting out different and better fruits age by age, and even helping the tree bear better apples, and the bush better berries; and therefore we say, "Well, there will come a time when this wonderfully endowed and protected race of beings will work in some finer material than steel, and by some finer force than electricity or gasoline explosions. Its present progress has every sign of being only preparation."

The waste which we practice upon the original store of wealth is always repairing itself. That is to say, the time we waste is wasted for us, not for Time—somewhere the unused hours and days return to original source where there are neither days nor hours, nor yet Time, but endless duration. Hours and days are doled out to us as small coin to see how we will use them.

It is the same everywhere. Wasted material is replaced; the earth never ceases making what we need and is prepared to fill future needs of which we have not now the slightest foreknowledge. If men waste energy, it is lost to them as individuals—the great reservoir of energy on which all life draws is not exhausted.

Therefore the great word of life is Use.

Some would say Economy. Not so. The word economy represents a half-idea born of fear. Its history is something like this: the great and tragic fact of waste is brought home to the mind by some circumstance, usually of a most materialistic kind; or there comes a violent reaction against extravagance—for even nature rebels against our unwise courses (which is the reason why so many people break down from "overwork," which is not overwork at all); and as a sudden revulsion against it all, the mind catches hold of the idea of "economy." It flies from a greater evil to a lesser one; it does not make the full journey from error to truth.

Economy is the rule of half-alive minds. There can be no doubt that it is better than waste, neither can there be any doubt that it is not as good as Use.

People who pride themselves on their economy sometimes bristle when it is attacked, as if one of the virtues had been denounced. It is principally in the interests of the economizers that this attitude is taken. For if there is anything more pitiable on earth than a poor, pinched mind spending the rich days and months pinching at a few pieces of metal, or paring the outer necessities of life to the very quick—if there is anything more pitiable, where is it?

Obviously, a practice that so pinches the mind is a wrong one. We all know economical people who seem to be niggardly even about the amount of air they breathe and the amount of appreciation they will allow themselves to give anything. They are all shriveled up.

Indeed, economy is waste: it is waste of the juices of life, the sap of living. For there are two kinds of waste: that of the prodigal who throws his substance away in riotous living, and that of the sluggard who allows his substance to rot from non-use. In the precious things of life the strict economizer is in danger of being classed with the sluggard.

The beauty of the principle of Use is that it obtains all the advantages of economy and at the same time gives healthy expression to all the instincts of which wastefulness are diseased symptoms. Most people's extravagance is a reaction from severe suppression of expenditure. Most people's economy is a reaction from extravagance.

Under the principle of Use the expansive experience of expenditure is obtained, as well as the self-control and economic discipline of "economizing."

Everything was given us to use. There is no evil from which we suffer that did not come about through misuse. There is no function which human beings can fulfil that is not good. But we have all about us the spectacle of whole nations having to make laws against things, not bad fundamentally, but bad in their misuse. The worst possible sin we can commit against the things of our common life is to misuse them. "Misuse" is the wider term. We like to say "waste," but waste is only one phase of misuse. All waste is misuse; all misuse is waste.

It is possible even to overemphasize the savings habit. It is proper and desirable that everyone have a margin; it is really wasteful not to have one, if you can have one. But it can be overdone.

We teach children to save their money. As an attempt to counteract thoughtless and selfish expenditure, it has its value; but it is not positive; it doesn't lead the child out into safe and useful avenues of self-expression or self-expenditure.

To teach a child to invest is better. Most men are saving a few dollars who, if they would invest those few dollars, first in themselves, and then in some useful work, would find it easier to save because they would have more to save.

Young men ought to be investing instead of saving. They ought to be investing in themselves to increase their creative value; after they have brought themselves to their peak of usefulness, then will be time enough to think of laying aside, as a fixed policy, a certain substantial share of income.

You are not "saving" when you are preventing yourself from becoming more productive. You are really taking out of your ultimate capital; you are reducing yourself in value as one of nature's investments.

The principle of Use is the main guide-post. Use is positive, active, life-giving. Use is alive. Use adds to the sum of good. Start out on that principle. You will have just as much materially, but you will have a great deal more mentally and spiritually. Investment is the prerequisite of returns. Investment is, in the old-fashioned term, "putting out to use."

USE is the antidote for the twin evils of waste and economy. These are both destructive, one of matter and the other of mind. The savings habit can be overdone, especially by young men. To Use what you have and what you are is much better than merely to "save" what you have. The best saving you can make is to invest in yourself; make Use of your money to make yourself more Useful, and then in your proper career you can handle the savings matter with ease. The only proper economy is Use. The only cure for waste is proper Use. The terms "waste" and "use" have no meaning apart from the individual. We cannot destroy matter. We can miss our opportunity with it, and misuse it, that's all. Our own interests are all locked up in the principle of Use.

One Hundred Days of Harding—By A. R. PINCI

President at This Time Declared to Be More Regent Than Executive

ONE hundred days of Harding!

What of them? Are they, chronologically, a fair sample by which to judge the President for what he has done? One-twelfth of a dozen is a standard business term for a sample; and Harding's hundred days represent an approximate quantity, a little less than one-fourteenth of the term for which he has been elected. In other words, is the country warranted in forming a judgment upon the Republican Administration's performance so far?

It is, at the time of writing, a debated question, this; but reportorial precision compels the admission that an indefinite but powerful majority of citizens, regardless of party, has taken the affirmative and has about drawn the first G. O. P. trial balance.

Yet this proclivity for analysis has not been very well received by many Republicans, who seem to forget that forming a judgment and passing a sentence are two distinct things. It is too soon by at least a year to frame a sentence, but it is undeniably in order to review the situation.

This difference should be understood by that floating minority attaching to every party, that is always hesitating and apologetic and whose habitual retort is "Wait," or "Give us a chance," whenever voters become inquisitive or the opposition critical. Separate and unworthy of consideration is that censorious group whose sole aim is nothing but the itch of odious comparisons. The safest measure is a mean average between "pointing with pride," of which too much has been done, and "viewing with alarm," so far camouflaging harrying satire.

Would Be Impersonal

THE political horizon, unfortunately, has been obscured by an element that not only has overinjected personalities in a political duel that has, or should have, served its purpose, but is obsessed with the idea that there exists an organized campaign of vituperation against the late Democratic Administration, and incidentally bent upon "destroying" ex-President Woodrow Wilson.

This is preposterous. The Democratic Administration achieved, together with some failures, a great deal of good. No Republican worth the name will deny it.

President Wilson was a most disconcerting opponent. His followers and his admirers may congratulate themselves upon a very evident fact—that there is no Republican in sight who will be as spiritedly pugnacious in behalf of his own party. President Harding does not dominate the Republican party. He is not dynamic; but a substituting magnetism is of equal if gentler usefulness in an emergency. To this extent he does not represent in his party the power represented by President Wilson over the Democratic party.

This means a great deal. It means that there is no perfect point of contact as between the Harding and Wilson administrations. It means that Dr. Wilson is ostensibly responsible for what happened by his party's authority under his double term, whereas President Harding would rather spread the responsibility throughout the Republican ranks. It means, to be exact, that President Harding wants to be regarded as the impersonal medium of his Administration, and to what extent he will succeed in that remains to be seen. Thus it is not possible to fix the relative position of the two Presidents without adequate qualification.

Task of Elimination

THE most important one is that Woodrow Wilson is more than the name of a former President; that it is, instead, the popular symbol of and for the late Administration. It is a cognominal metaphor for eight years of Democracy. Unfortunately, this frequent but necessarily impersonal use of that name has led to the belief, here and there, that the Republicans are going out of their way to denigrate its owner.

The fact is that President Harding is everywhere confronted and beset by the dominant personality of Dr. Wilson. The latter's influence is inextricably, or almost so, interwoven in every policy which he bequeathed to the present incumbent. Dr. Wilson has been a genuine idealist. He worked not for the moment, but for the future; and the Republicans, not to mention an assortment of Democrats too, are just about finding out how thorough a job he made of it, so far as he could go ahead with it.

As between Democrats and Republicans, and as between Republicans and Republicans, and as between either and Progressives, there seems to be no agreement as to exactly what policies the Harding Administration shall manage to carry out. It is evident, therefore, that the one authority on this mooted point is the President. And the President himself, if one wishes to be hypercritical, has not committed himself very definitely—not, at least, during the campaign or since. It is necessary, therefore, to go further back and examine his preceding opinions, a safe thing to do since he has authorized no retractions.

If there ever has been a President whose every word and deed in the public service is unmistakable, that President is in the White House today. The ambitious attempt to combine his scattered meanings into a composite attitude could lead nowhere except to error. Generally speaking, he contested the Democrats on every point. The net result was that his campaign was a campaign of reversal, a fact supported by the irreconcilables, who alone made the issues. These issues are directly related to the issues of the Wilson Administration.

President Harding, therefore, is not a free agent. He is unable, as yet, to initiate any sort of individual policy, because his first problem has been that of elimination. Owing to circumstances over which he has had no control, he has been obliged to assume the dual, and very unsatisfactory, rôle of judge and executive. He has been obliged to review the work of ex-President Wilson before he can assume responsibility on his own account, meanwhile embarrassed by his inability to act until after he has approved, amended or rejected, step by step, his inherited and unescapable problems. These he must adjust in accordance with party promises. Thus it becomes easy for a few politicians to confuse the question and pretend that President Harding is bent upon destroying Woodrow Wilson's achievements. And if it should happen, as it undoubtedly will, that any part of ex-President Wilson's unfinished business shall be successfully consummated by the Harding Administration, it will be alleged that Wilson's thunder has been stolen.

For these reasons, President Harding is at this time more of a regent than an executive.

To be exact, he will not be a full-fledged independent executive until after he has carefully examined every Wilsonian issue before him and disposed of it. It is probable, of course, that there will be divergent opinions between himself and his party's leaders on this, not only because the President is unwilling to control the party outright, but because a few of his most prominent advisers are officials who before the campaign was waged, weighed against the rank and file of the Republicans and inferentially in favor of Wilson.

These officials represent, however, the very antithesis of Republican purpose as set forth during the campaign. And it is beyond question that the opinions of these officials, measured strictly on a political basis, are of little or no consequence in comparison to the opinions of the irreconcilable Republicans.

It would be foolish to deny that there exists any undue affection between these two factions in the present Administration. They are friendly enemies, but the advantage is entirely on the side of that wing which owes its office to the voters and not to the executive. Consequently the former, which is made up of bitter-enders, are marking time. That is why they have been so quiet—during the first three months of the Administration—and why they have seemingly been vanquished by the President's personal lieutenants.

"Balderdash," Said Harding

A PARTY showdown is inevitable. It may be deferred, but it is bound to come. When it does, President Harding must either stand by his senatorial record as an irreconcilable or turn his back to it. It will be a very solemn moment.

Colonel George Harvey, American ambassador to Great Britain, has been the very first Republican to sense its approach. He is too subtle a man, despite his fiery style, and so it may be taken for granted that behind his now famous London speech there must have been a purpose. What was it?

Democrats have attempted to heckle the President about it. What does he think about it? Well, here is his opinion, plain and unadorned, uttered at a time when the vote he cast for the war was still fresh in his mind. As he has not retracted it, it must stand as of today. Said he four years ago:

> The President has said, and beautifully said, that we want to make the world safe for democracy. I subscribe to that sentiment, Senators, but I want to say to you men who are responsible for government in these trying times that you cannot justify this war and you cannot unify the American people in the defense of the American nation except on the justifiable ground of defending and preserving American national rights. If I were in any place other than the Senate Chamber of the United States, where one might speak with a little more freedom than the courtesies of this body require to be observed, I would say that much of the sentiment uttered concerning our part in the war is balderdash.

That is unequivocal language. It places the burden of our war on the saddle of patriotism, and it is not possible to read into the President's attitude the idealism that not a few individuals profess to read in accord with Wilson principles. Not that both Harding and Wilson may not be right, but a prosaic analysis warrants the belief that the President's opinions of record are quite at variance with those of his predecessor. In the heat of the campaign he emphasized this variance, but in later days he has been less direct. This quiescence has been the source of much cogitation.

In consonance with the President's wish to let the Congress act independently he undoubtedly assumed that the peace resolution was a legislative matter, but had he taken a hand in shaping it at the very outset by now it would be an accomplished fact. "I promise you formal and effective peace as quickly as a Republican Congress can pass its declaration for a Republican executive to sign." It was his promise, a year ago, which by the alchemy of election became a mandate; and though "quickly" may mean no time limit, the country can be forgiven for understanding it as calling for speed.

The minority, naturally, has been critical. It is the office of the minority to find fault with what the majority is doing. Naturally it objects to any rejection of the Wilson policies. This ubiquity of Wilson, already referred to, is a touchy and delicate matter. The President cannot overcome it except by courageous action. And nothing but action, which will determine his political fortunes, will help him. In Washington it is whispered about that he is not enough of a determined antagonist of the late Administration. In France they consider his association of nations a Wilsonian policy. It is feared, too, that he has been too prone to make speeches, at a time not propitious for speech-making, and his most faithful New York newspaper has chided him about it.

Before sketchily considering the situation, one fact must be understood, a fact that will govern future judgment. President Harding is certainly the first executive who at the outset has been fortified with preparatory knowledge of the job before him. A Senator for five years, and a prominent Senator too, he knows all about Congress; as an active critic of the late administration he is familiar with its merits or demerits.

No Anti-Harding Group

IT WILL happen, and not necessarily far hence, that any delays in bringing about a change will be countered with reminders along these lines. For that reason his task is doubly arduous, because the people have looked for speed. For this attitude he has been not a little responsible. Having for a few years pointed out that which has been wrong, or not right, inferentially leads to the conviction that he would have no trouble in making the required changes once he was in power to do so.

It would be too much to say that President Harding would or could perform miracles. His very best is bound to contain a little of the bad, if he is not superhuman. It would not be just to him to say that his official conduct in the future will be on the basis of his first hundred days, but nevertheless it remains the opinion, so far as impartial investigation goes, that he will be unable to carry out all of the party's promises in four years at the present rate of progress.

To what is this tardiness due? For it is tardiness and not, as some would have it, sluggishness. It cannot be charged to that illusive anti-Harding group about which many politicians talk but which nobody has yet found. The President has made enough enemies on his own account to invite some in turn, but these as yet are in eclipse. They will remain so for a couple of years at least. From them at this time he will not hear.

Whatever be the trouble it must be searched for within the Republican party. It is adhesive, this party, but not cohesive. There are many rifts, despite some very clever work in concealing them. Yet patronage is one of those things that, like murder, will out. Scylla and Charybdis to mariners was nothing compared to patronage for party leaders. Between a President whose "personal" appointments, as he himself has termed them, are becoming a feature of this administration as they were of the last, and a few important and if need be truculent executives who retain Democratic assistants in bland disregard of politics, patronage is not without its potential perils.

It would be difficult, of course, to duplicate President Wilson's system of personal appointments, because he controlled the party and by the same token made it over. Patronage has very little bearing in Wilson's success with his party. But the same cannot be said for President Harding. Unwilling, as I have said, to control the party, and perhaps now too late for him to do so if so minded, his disregard of Republican leaders is not going to be without effect later on.

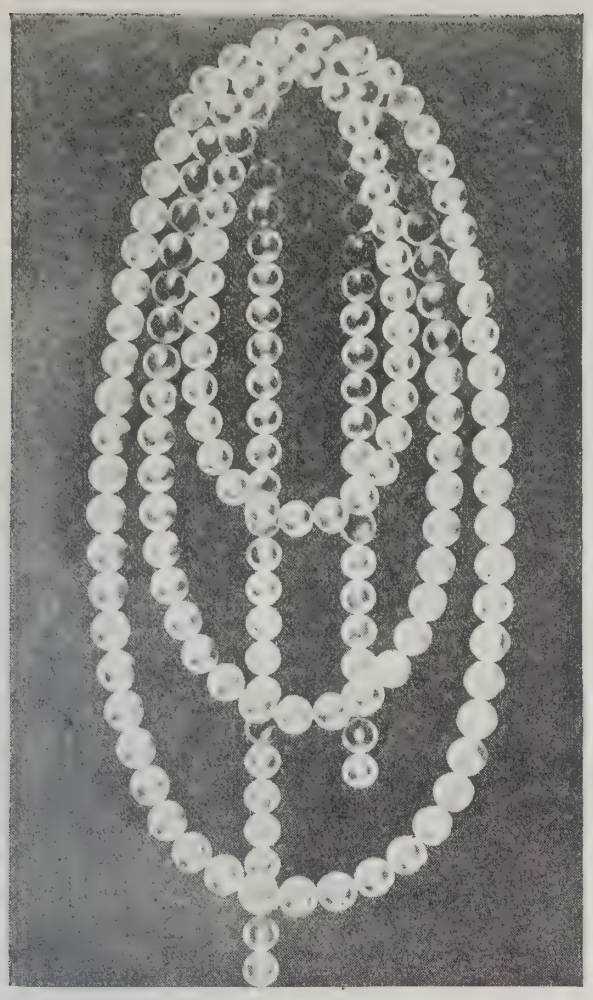
Certain leaders are decidedly displeased about the situation. Now a great deal may be said in favor of efficiency, ostensibly involving the retention of experienced men regardless of political beliefs, but Republican leaders are unanimous, and are quoting the President to that effect, that the campaign was waged against the entire Democratic Administration. They are as a matter of principle against every Democrat.

As a party slogan they intend that the Administration shall stand or fall without divided responsibility or credit. They want a Republican in every place occupied by a Democrat and not intended by organic act of Congress for Democrats.

Big Business Men Often Misfits

PRESIDENT HARDING'S circumspection in making appointments is traceable to his desire to select the best men for the right place, but this ideal ability is subject to the personal equation. In a President, this personal equation is almost boundless. In connection with the personnel of a certain board he declared that he was looking for "$100,000 men." Whether he has succeeded or not in finding them is neither here nor there. Even if any of them is not in that class, the advance label places him there by inference.

Yet the war period is full of examples showing that high-salaried men in business and industry are frequently helpless and perhaps misfit in the government service. Being a million-dollar man has no true bearing upon his capacity as a governing official in the public service, any more than a twenty-five-dollar-a-day goldsmith would be a success at eight-dollar bookbinding. What the President really intended was that he was looking for men who would be worth at their government job the stated sum and not merely their wage.



On the question of patronage, to use the commonplace word for what should be the proper distribution of offices among men of the successful party, the Republican Administration is traversing troubled waters.

So much for the negative side of it. On the other hand President Harding is entitled to unstinted congratulations not only for uniting himself to men of different political thought, but for having achieved the

(*Concluded on page 12*)

Pearls in Reality and Romance

By CARL SCHURZ LOWDEN

The late Russian Czar spent a quarter of a century in assembling this rope of perfect virgin pearls for his wife whom he devotedly loved.

FATE favored a young farmer who, on a certain summer day, went "pearling" on a tributary of the Mississippi River. It led him to make a momentous decision that changed his style of living.

He had dredged and dredged. Hundreds of niggerhead mussels, scientifically known as unio, had closed tightly upon the spider hooks. In mid-afternoon he had taken his catch ashore and proceeded to open the shells by hand. If he had boiled them for ten minutes as most of the other fishers did, they would have burst open but the process would have damaged any pearls they contained.

The sun sank lower and lower. The cows on his lonesome farm were waiting to be fed and milked; the horses, pigs and chickens were hungry too. He looked at the pile of niggerheads yet to be opened. Feeding by lantern light was no joy. He saw a man lounging nearby.

"Hey, pard," he called, "I'll take fifty cents for this bunch here. I got to be goin'."

The man approached and eyed the shells. "They ain't wuth more'n forty," he said.

They bantered back and forth, but both were obstinate. The would-be seller refused to come down in his price and the would-be buyer refused to increase his offer. Soon the man walked away. The next shell the farmer opened contained a pearl which he sold for a thousand dollars.

The farmer never knew that the buyer disposed of it for two thousand or that a jeweler made it into a pendant for which he received five. He would not have cared much anyhow, for the small fortune from the sale of the pearl meant that he could soon claim his sweetheart as his bride.

This may be just the first chapter of that pearl's story of love. Some man of wealth bought the pendant for a sweetheart or wife as a token of affection. In the future this woman's daughter will wear it from her neck; it will enhance her beauty, and some day some man will begin by admiring it and go on to admiring her. The imagination can fill in the rest.

Pearls were made for women, and women were made for pearls. No pearl has its best setting or shows off to best advantage in a jeweler's tray of finest velvet; but worn by a woman it delicately contrasts with her smooth, white skin and becomes enriched. The Roman beauties let the gems softly tinkle from their ears to bewitch the young men. The queens of Egypt knew their value as Cupid's aids. The houris of the Moslems fastened their filmy garments with pearl ornaments. Even the brown daughters of the South Seas wear pearls.

The ideal qualities of the ocean's most exquisite gem and of woman are the same. A pearl symbolizes purity, innocence and modesty; and these assets belong to the highest type of feminine beauty.

Sovereigns, both modern and ancient, used pearls to pay tribute to women. Julius Caesar had a buckler of the British stones placed in the temple of Venus, and to the sister of Cato he presented one worth a quarter of a million dollars. The late Czar of Russia spent a quarter of a century in assembling sufficient virgin pearls to fashion a necklace "as perfect as his wife."

When the Spanish ambassador visited London and boasted the splendor of the Spanish court, Sir Thomas Gresham boldly averred none could beat that of the good Queen Elizabeth. To demonstrate the great wealth of the English he chose a valuable gem, had it ground into powder, poured the powder into wine and gleefully drank the mixture in honor of the lady that occupied the throne.

Cleopatra gave a sumptuous banquet in honor of Mark Anthony and, to show her love for him, consumed a large gem which Pliny rated at a third of a million dollars. She is said to have dissolved it in vinegar; but, as the liquid can scarcely be considered palatable and as no acid except the strongest will dissolve a pearl, the story unfortunately seems doubtful. Perhaps the voluptuous queen reduced the pearl to dust and quaffed it in wine as Gresham did many centuries afterward.

Poets have seized upon the pearl with which to idealize women. In "Memories" Tennyson pictured the girl as the possessor of "eyes glad with smiles, and brow of pearl." In "Recollections of Arabian Nights" one of the beautiful women has a "brow of pearl tressed with redolent ebony." Tasso described Armida as ministering to her hero by wiping away the "living heat-dews that impearl'd his face." Shakespeare let King Richard III characterize a woman's tears as transformed to Orient pearls."

Perhaps the most favored comparison of woman's beauty with the gem is that which likens her teeth to rows of pearls. Byron said of an houri in a Turkish harem that her lips apart "showed the pearls beneath," and another poet spoke "of Orient pearls a double row" which cherry lips inclosed. Edmund Spenser quaintly declared that his love's teeth were "Pearles both pure and round." Lowell set a new fashion among the poets by comparing the dentine group to one gem, as in his "Fable for Critics" the goddess of freedom has "lips like a cherry and teeth like a pearl."

Perhaps no poet ever made more frequent allusions to the sea gem than did the Irish bard, Sir Thomas Moore. Undoubtedly one of the quaintest was that which presented pearls as possessing a "smoother whiteness" after doves had played with them. This, of course, merely embodied the ancient belief or superstition that doves could transmit the exquisite hue of their plumage to other snowy objects. In the "Loves of the Angels" he conveyed a double compliment when he asserted that the jewel on the "neck of woman threw a light it lent and borrowed too." The conception is highly poetic and, it may be said, one of the finest in the English language. Yet, consider the exquisite fancy embodied in this message of love:

"If I were yonder conch of gold
And thou the pearl within it placed,
I would not let an eye behold
The sacred gem my arms embraced."

The Irish rhymer wrote those four lines a hundred years and more ago. Have any of our modern poets produced any pearl sentiment that equals or surpasses it? Though it has largely become the fashion to look down on twentieth century efforts, "The Rosary" by Robert Cameron Rogers, eloquently answers the question. It ingeniously combines the pearl with love and religious feeling and is, I hold, one of the most beautiful references ever made to the gem born within the rough exterior of the mollusk. How touching this is!

"The hours I spend with thee, dear heart,
Are as a string of pearls to me;
I count them over every one apart,
My rosary.

Each hour a pearl, each pearl a prayer,
To still a heart in absence wrung;
I tell each bead unto the end, and there
A cross is hung."

Robert Browning's famous line, "The hillside's dew-pearled," has a double meaning or origin. The dewdrops on the fence, the grass, and the spider's web, shimmer in the light of the morning sun like the gems. But the ancients did not liken the gems to dew; rather, they maintained that they were dewdrops congealed. At the full of the moon the oysters were supposed to rise to the surface of the sea, open their shells, and receive the drops of dew. Pliny, who wrote of gems about twenty-three centuries ago, said that if the weather was cloudy the resulting pearl would be pale in color. He also averred that the size of the gem depended upon the amount of dew that entered the shell, that thunder during the process would make it hollow, and lightning would cause the shell to snap shut so that the product would be dwarfed or undersized.

The Arabs had the same or a similar idea. "The rain of the month of Nisan," one of their proverbs set forth, "brings forth pearls in the sea and wheat on the land." The idea survived until 1733 when two Arab travelers wrote an account of their sojourn in India and China. They mentioned the "dew of heaven" theory enunciated by Pliny, discounted it, and then clearly revealed their doubt.

"Others say that pearls," they wrote, "are produced in the oysters themselves. This appears more probable and is confirmed by experience, for the greater part of those observed in the oysters are firmly attached there and are immovable. Those which are mobile are called by the merchants seed-pearls. Allah knows how the matter really stands."

Here the Japanese "pearlers" are seen at rest. Behold the example of domesticity, man and wife laboring side by side.

Scientists have discovered that the nucleus of a pearl is a worm parasite. To protect itself from harm and irritation the mollusk covers the intruder with a secretion, commonly known as nacre. It applies the nacre again and again as if it feared the organism would escape from the prison. Because of these successive coats defective pearls can be peeled by skillful workers and their value often greatly enhanced; but, if the operator's knife slips, the gem may be damaged beyond repair.

In the old days pearls were regarded as living objects which would die if not properly cared for. Gems that had lost their luster were classified as diseased, and remedies were prescribed for them. Usually the fair owner was advised to wear the ornament next the skin, as it was held that the jewels pine away when neglected.

Recently a California judge ordered a $100,000 pearl necklace "nursed back to health." He had conferred with lapidaries who pronounced the gems "sick." They told him the ornament needed light and air and, more than anything else, the vitalizing contact with the soft warm neck of a woman. The experts predicted that the necklace would continue to "starve" unless it received the suggested treatment. The judge then ordered the piece to be worn throughout one month each year, and added:

"After the hearing of said petition many requests to wear the pearls have come to the court from trained nurses and other women claiming to be in such perfect health that they would be able to preserve the luster. These requests have been fully considered by the court but, after seeing the petitioner's wife, Mrs. James B. Blum, I am convinced she is sufficiently sound in body and health to wear this necklace and preserve the luster of these pearls."

The divers for pearls have a hard life. Those of Ceylon and the Persian Gulf grease their bodies, stuff cotton in their ears, close their nostrils with a clip, and go down with a basket or net at the waist. They remain beneath the surface from sixty to eighty seconds. If attacked by a sword fish, they must hide and outstay him. Sharks, devil-fish, and rock-cod are other enemies; the last lies with his mouth wide open and grimly waits for his victim to step in. Divers do not welcome the use of a suit supplied with an air-line, and the majority of pearls are obtained in the old-fashioned way by nude or semi-nude men.

The largest known gem today lies in the Beresford Hope collection in the South Kensington Museum of London. It has a length of two and a circumference of four and one-half inches, and weighs three ounces. The finest pearl, "La Pellegrina," has its home in a museum at Moscow though it was born off the coast of the East Indies. Insignificant in size, it is perfectly round and possesses a luster which causes it to seem transparent.

The translucent jewel is a birthstone, a comparative newcomer as it were. The older generation of June children wore agates; but a few years ago the American National Retail Jewelers' Association endeavored to overcome some of the confusion that existed at that time, rearranged the list of birthstones, and replaced the agate with the pearl. Now it is said:

"Who comes with summer to this earth,
And owes to June her hour of birth,
With ring of pearl upon her hand
Can health, long life and wealth command."

Jewish Idea of Central Bank for America

The Evolution of Paul M. Warburg's Idea of Federal Reserve System Without Government Management

ACCORDING to his own statements and the facts, Paul M. Warburg set out to reform the monetary system of the United States, and did so. He had the success which comes to few men, of coming an alien to the United States, connecting himself with the principal Jewish financial firm here, and immediately floating certain banking ideas which have been pushed and manipulated and variously adapted until they have eventuated in what is known as the Federal Reserve System.

When Professor Seligman wrote in the Proceedings of the Academy of Political Science that "the Federal Reserve Act will be associated in history with the name of Paul M. Warburg," a Jewish banker from Germany, he wrote the truth. But whether that association will be such as to bring the measure of renown which Professor Seligman implies, the future will reveal.

What the people of the United States do not understand and never have understood is that while the Federal Reserve *Act* was governmental, the whole Federal Reserve *System* is private. It is an officially created private banking system.

Mr. Warburg's Plan Good for War Time

EXAMINE the first thousand persons you meet on the street, and 999 will tell you that the Federal Reserve System is a device whereby the United States Government went into the banking business for the benefit of the people. They have an idea that, like the Post Office and the Custom House, a Federal Reserve Bank is a part of the Government's official machinery.

It is natural to feel that this mistaken view has been encouraged by most of the men who are competent to write for the public on this question. Take up the standard encyclopedias, and while you will find no misstatements of fact in them, you will find no direct statement that the Federal Reserve System is a private banking system; the impression carried away by the lay reader is that it is a part of the Government.

The Federal Reserve System is a system of private banks, the creation of a banking aristocracy within an already existing autocracy, whereby a great proportion of banking independence was lost, and whereby it was made possible for speculative financiers to centralize great sums of money for their own purposes, beneficial or not.

That this System was useful in the artificial conditions created by war—useful, that is, for a Government that cannot manage its own business and finances and, like a prodigal son, is always wanting money, and wanting it when it wants it—it has proved, either by reason of its inherent faults or by mishandling, its inadequacy to the problems of peace. It has sadly failed of its promise, and is now under serious question.

Mr. Warburg's scheme succeeded just in time to take care of war conditions, he was placed on the Federal Reserve Board in order to manage his system in practice, and though he was full of ideas then as to how banking could be assisted, he is disappointingly silent now as to how the people can be relieved.

However, this is not a discussion of the Federal Reserve System. General condemnation of it would be stupid. But it is bound to come up for discussion one day, and the discussion will become much freer when people understand that it is a system of privately owned banks, to which have been delegated certain extraordinary privileges, and that it has created a class system within the banking world which constitutes a new order.

He Wanted One Central Bank

MR. WARBURG, it will be remembered, wanted only one central bank. But, because of political considerations, as Professor Seligman tells us, twelve were decided upon. An examination of Mr. Warburg's printed discussions of the subject shows that he at one time considered four, then eight. Eventually, twelve were established. The reason was that one central bank, which naturally would be set up in New York, would give a suspicious country the impression that it was only a new scheme to keep the nation's money flowing to New York. As shown by Professor Seligman, quoted in the last number, Mr. Warburg was not averse to granting anything that would allay popular suspicion without vitiating the real plan.

So, while admitting to the Senators who examined him as to his fitness for membership on the Federal Reserve Board—the Board which fixed the policies of the banks of the Federal Reserve System and told them what to do—that he did not like the 12 district banks idea, he said that his objections to it could "be overcome in an administrative way." That is, the 12 banks could be so handled that the effect would be the same as if there were only one central bank, presumably at New York.

And that is about the way it has resulted, and that

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

will be found to be one of the reasons for the present situation of the country.

There is no lack of money in New York today. Motion picture ventures are being financed into the millions. A big grain selling pool, nursed into existence and counseled by Bernard M. Barúch, has no hesitancy whatever in planning for a $100,000,000 corporation. Loewe, the Jewish theatrical man, had no difficulty in opening 20 new theaters this year—

But go into the agricultural states, where the real wealth of the country is in the ground and in the granaries, and you cannot find money for the farmer.

It is a situation which none can deny and which few can explain, because the explanation is not to be found along natural lines. Natural conditions are always easiest to explain. Unnatural conditions wear an air of mystery. Here is the United States, the richest country in the world, containing at the present hour the greatest bulk of wealth to be found anywhere on earth—real, ready, available, usable wealth; and yet it is tied up tight, and cannot move in its legitimate channels, because of manipulation which is going on as regards money.

Money is the last mystery for the popular mind to penetrate, and when it succeeds in getting "on the inside" it will discover that the mystery is not in money at all, but in its manipulation, the things which are done "in an administrative way."

The Money Question and the Jewish Question

THE United States has never had a President who gave evidence of understanding this matter at all. Our Presidents have always had to take their views from financiers. Money is the most public quantity in the country; it is the most federalized and governmentalized thing in the country; and yet, in the present situation, the United States Government has hardly anything to do with it, except to use various means to get it, just as the people have to get it, from those who control it.

The Money Question, properly solved, is the end of the Jewish Question and every other question of a mundane nature.

Mr. Warburg is of the opinion that different rates of interest ought to obtain in different parts of the country. That they have always obtained in different parts of the same state we have always known, but the reason for it has not been discovered. The city grocer can get money from his bank at a lower rate than the farmer in the next county can get it from his bank. Why the agricultural rate of interest has been higher than any other (when money is obtainable; it is not obtainable now) is a question to which no literary nor oratorical financier has ever publicly addressed himself. It is like the fact of the private business nature of the Federal Reserve System—very important, but no authority thinks it worth while to state. The agricultural rate of interest is of great importance, but to discuss it would involve first an admission, and that apparently is not desirable.

In comparing the present Federal Reserve Law with the proposed Aldrich Bill, Mr. Warburg said:

> Mr. Warburg—" . . . . . I think that this present law has the advantage of dealing with the entire country and giving them different rates of discount, whereas, as Senator Aldrich's bill was drawn, it would have been very difficult to do that, as it provided for one uniform rate for the whole country, which I thought was rather a mistake."
>
> Senator Bristow—"That is, you can charge a higher rate of interest in one section of the country under the present law, than you charge in another section, while under the Aldrich plan it would have been a uniform rate."
>
> Mr. Warburg—"That is correct."

That is a point worth clearing up. If Mr. Warburg, having educated the bankers, will now turn his attention to the people, and make it clear why one class in the country can get money for business that is not productive of real wealth, while another class engaged in the production of real wealth is treated as outside the interest of banking altogether; if he can make it clear also why money is sold to one class or one section of the country at one price, while to another class and in another section it is sold at a different price, he will be adding to the people's grasp of these matters.

This suggestion is seriously intended. Mr. Warburg has the style, the pedagogical patience, the grasp of the subject which would make him an admirable public teacher of these matters.

What he has already done was planned from the point of view of the interest of the professional financier. It is readily granted that Mr. Warburg desired to organize American finances into a more pliable system. Doubtless in some respects he has wrought important improvements. But he had always the banking house in mind, and he dealt with paper. Now, if taking up a position outside those special interests, he would address himself to the wider interests of the people—not assuming that those interests always run through a banking house—he would do still more than he has yet done to justify his feeling that he really had a mission in coming to this country.

The Fight for a Private Federal System

MR. WARBURG is not at all shocked by the idea that the Federal Reserve System is really a new kind of private banking control, because in his European experience he saw that all the central banks were private affairs.

In his essay on "American and European Banking Methods and Bank Legislation Compared," Mr. Warburg says: (the italics are ours)

"It may also be interesting to note that, *contrary to a widespread idea, the central banks of Europe are, as a rule, not owned by the governments.* As a matter of fact, neither the English, French, nor German Government owns any stock in the central bank of its country. *The Bank of England is run entirely as a private corporation,* the stockholders electing the board of directors, who rotate in holding the presidency. In France the government appoints the governor and some of the directors. In Germany the government appoints the president and a supervisory board of five members, while the stockholders elect the board of directors."

And again, in his discussion of the Owen-Glass Bill, Mr. Warburg says:

"The Monetary Commission's plan proceeded on the theory of the Bank of England, *which leaves the management entirely in the hands of business men without giving the government any part in the management or control.* The strong argument in favor of this theory is that central banking, like any other banking, is based on 'sound credit,' that the judging of credits is a matter of business which should be left in the hands of business men, *and that the government should be kept out of business.* . . . . . The Owen-Glass Bill proceeds, in this respect, more on the lines of the Banque de France and the German Reichsbank, the presidents and boards of which are to a certain extent appointed by the government. *These central banks, while legally private corporations,* are semi-governmental organs inasmuch as *they are permitted to issue the notes of the nation* —particularly where there are elastic note issues, as in almost all countries except England—and inasmuch as *they are the custodians of practically the entire metallic reserves of the country and the keepers of the government funds.* Moreover in questions of national policy *the government must rely on the willing and loyal co-operation of these central organs.*"

Government Control "Dangerous"—"Fatal"

THAT is a very illuminating passage. It will be well worth the reader's time, especially the reader who has always been puzzled by financial matters, to turn over in his mind the facts here given by a great Jewish financial expert about the central bank idea. Observe the phrases:

(a) "without giving the government any part in the management or control."

(b) "these central banks, while legally private corporations. . . . are permitted to issue the notes of the nation."

(c) "they are custodians of practically the entire metallic reserves of the nation and the keepers of the government funds."

(d) "in questions of national policy, the government must rely on the willing and loyal co-operation of these central organs."

It is not now a question whether these things are

right or wrong; it is merely a question of understanding that they constitute the fact.

It is specially notable that in paragraph (d) it is a fair deduction that in questions of national policy, the government will simply have to depend not only on the patriotism but also to an extent on the permission and counsel of the financial organizations. That is a fair interpretation: questions of national policy are, by this method, rendered dependent upon the financial corporations.

Let that point be clear, quite regardless of the question whether or not this is the way national policies should be determined.

Mr. Warburg said that he believed in a certain amount of government control—but not too much. He said: "In strengthening the government control, the Owen-Glass Bill therefore moved in the right direction; but it went too far and fell into the other and even more dangerous extreme."

The "more dangerous extreme" was, of course, the larger measure of government supervision provided for, and the establishment of a number of Federal Reserve Banks out in the country.

Mr. Warburg had referred to this before; he had agreed to the larger number only because it seemed to be an unavoidable political concession. It has already been shown, by Professor Seligman, that Mr. Warburg was alive to the necessity of veiling a little here and there, and "putting on" a little yonder, for the sake of conciliating a suspicious public. There was also the story of the bartender and the cash register.

Mr. Warburg thinks he understands the psychology of America. In this respect he reminds one of the reports of Mr. von Bernstorff and Captain Boy-Ed of what the Americans were likely to do or not to do. In the Political Science Quarterly of December, 1920, Mr. Warburg tells how, on a then recent visit to Europe, he was asked by men of all countries what the United States was going to do. He assured them that America was a little tired just then, but that she would come round all right. And then, harking back to his efforts of placing his monetary system on the Americans, he said:

Mr. Warburg Reassures Foreign Friends

"I ASKED them to be patient with us until after the election, and *I cited to them our experiences with monetary reform.* I reminded them how the Aldrich plan had failed because, at that time, a Republican President had lost control of a Congress ruled by a Democratic majority; how the Democrats in their platform damned this plan and any central banking system; and how, *once in full power, the National Reserve Association was evolved, not to say camouflaged, by them into the Federal Reserve System.*"

Remembering this play before the public, and the play behind the scenes, this "camouflaging," as Mr. Warburg says, of one thing into another, he undertook to assure his friends in Europe that regardless of what the political platforms said, the United States would do substantially what Europe hoped it would. Mr. Warburg's basis for that belief was, as he said, his experience with the way the central bank idea went through in spite of the advertised objection of all parties. He believes that with Americans it is possible to get what you want if you just play the game skillfully. His experience with monetary reform seems to have fathered that belief in him.

Politicians may be necessary pawns to play in the game, but as members of the government Mr. Warburg does not want them in banking. They are not bankers, he says; they don't understand; banking is nothing for a government man to meddle with. He may be good enough for the Government of the United States; he is not good enough for banking.

"In our country," says Mr. Warburg, referring to the United States, "with every untrained amateur a candidate for any office, *where friendship or help in a presidential campaign, financial or political, has always given a claim for political preferment,* where the bids for votes and public favor are ever present in the politician's mind, ... *a direct government management, that is to say, a political management, would prove fatal* . . . . . There can be no doubt but that, as drawn at present (1913), with two cabinet officers members of the Federal Reserve Board, and with the vast powers vested in the latter, the Owen-Glass Bill would bring about direct government management."

And that, of course, in Mr. Warburg's mind, is not only "dangerous," but "fatal."

Mr. Warburg had almost his whole will in the matter. And what is the result?

Mr. Baruch Also Takes a Hand

TURN to the testimony of Bernard M. Baruch, when he was examined with reference to the charge that certain men close to President Wilson had profited to the extent of $60,000,000 on stock market operations which they entered into on the strength of advance information of what the President was to say in his next war note—the famous "leak" investigation, as it was called; one of the several investigations in which Mr. Baruch was closely questioned.

In that investigation Mr. Baruch was laboring to show that he had not been in telephone communication with Washington, especially with certain men who were supposed to have shared the profits of the deals. The time was December, 1916. Mr. Warburg was then safely settled on the Federal Reserve Board, which he had kept quite safe from Government intrusion.

> The Chairman—"Of course the records of the telephone company here, the slips, will show the persons with whom you talked."
>
> Mr. Baruch—"Do you wish me to say, sir? I will state who they are."
>
> The Chairman—"Yes, I think you might."
>
> Mr. Baruch—"I called up two persons; one, Mr. Warburg, whom I did not get, and one, Secretary McAdoo, whom I did get—both in reference to the same matter. Would you like to know the matter?"
>
> The Chairman—"Yes, I think it is fair that you should state it."
>
> Mr. Baruch—"I called up the Secretary, because someone suggested to me—*asked me to suggest an officer for the Federal Reserve Bank,* and I called him up in reference to that, and discussed the matter with him, I think, *two or three times,* but it was suggested to me that I make the suggestion, and I did so." (pp. 570-571)
>
> Mr. Campbell—"Mr. Baruch, who asked you for a suggestion for an appointee for the Federal Reserve Bank here?"
>
> Mr. Baruch—"Mr. E. M. House."
>
> Mr. Campbell—"Did Mr. House tell you to call Mr. McAdoo up and make the recommendation?"
>
> Mr. Baruch—"I will tell you exactly how it occurred: *Mr. House called me up* and said that there was a vacancy on the Federal Reserve Board, and he said, 'I don't know anything about those fellows down there, and I would like you to make a suggestion.' *And I suggested the name,* which he thought was a very good one, and he said to me, 'I wish you would call up the Secretary and tell him.' I said, 'I do not see the necessity; I will tell you.' 'No,' he said, 'I would prefer you to call him up.'" (p. 575)

There we have an example of the Federal Reserve "kept out of politics," kept away from government management which would not only be "dangerous," but "fatal."

Barney Baruch, the New York stock plunger, who never owned a bank in his life, was called up by Colonel E. M. House, the arch-politician of the Wilson Administration, and thus the great Federal Reserve Board was supplied another member.

A telephone call kept within a narrow Jewish circle, and settled by a word from one Jewish stock dealer—that, in practical operation, was Mr. Warburg's great monetary reform. Mr. Baruch calling up Mr. Warburg to give the name of the next appointee of the Federal Reserve Board, and calling up Mr. McAdoo, secretary of the United States Treasury, and set in motion to do it by Colonel E. M. House—is it any wonder the Jewish mystery in the American war government grows more and more amazing?

But, as Mr. Warburg has written—"friendship or help in *a presidential campaign,* financial or political, has always given a claim to political preferment." And, as Mr. Warburg urges, this is a country "with every untrained amateur a candidate for office," and naturally, with such men comprising the government, they must be kept at a safe distance from monetary affairs.

Warburg-House-Baruch in Conclave

AS IF to illustrate the ignorance thus charged, along comes Mr. Baruch, who quotes Colonel House as saying, "I don't know anything about those fellows down there and I would like you to make a suggestion." It is permissible to doubt that Mr. Baruch correctly quotes Colonel House. It is permissible to doubt that all that Colonel House confessed was his ignorance about "those fellows." There was a good understanding between these two men, too good an understanding for the alleged telephone conversation to be taken strictly at its face value. It is possibly quite true that Mr. House is not a financier. Certainly, Mr. Wilson was not. In the long roll of Presidents only a handful have been, and those who have been have been regarded as most drastic in their proposals.

But this whole matter of ignorance, as charged by Mr. Warburg, sounds like an echo of the Protocols:

> "The administrators chosen by us from the masses *will not be persons trained for government,* and consequently they will easily become pawns in our game, played by *our learned and talented counsellors, specialists educated from early childhood to administer world affairs.*"

In the Twentieth Protocol, wherein the great financial plan of world subversion and control is disclosed, there is another mention of the rulers' ignorance of financial problems.

It is a coincidence that, while he does not use the term "ignorance," Mr. Warburg is quite outspoken concerning the benighted state in which he found this country, and he is also outspoken about the "untrained amateurs" who are candidates for every office. These, he says, are not fitted to take part in the control of monetary affairs. But Mr. Warburg is. He says so. He admits that it was his ambition from the moment he came here an alien Jewish-German banker, to change our financial affairs more to his liking. More than that, he has succeeded; he has succeeded, he himself says, more than most men do in a lifetime; he has succeeded, Professor Seligman says, to such an extent that throughout history the name of Paul M. Warburg and that of the Federal Reserve System shall be united.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents each in stamps to cover printing and mailing cost.

Jewish World Notes

Canada is waking up to the fact that the immigration restrictions recently adopted by the United States have had the effect of flooding Canada with Jewish immigrants. An article in the Montreal *Herald* of June 17, says:

"The immigration authorities are somewhat concerned in regard to the great number of people of the Jewish race who are finding their way into Canada. In the past British and Italians have headed the landing lists, but the Jews are easily leading today, and as they are not workers on the land, in the mines, in the forests, or on railways, but confine their efforts mostly to factory work, the authorities are at a loss to know where all of them can find work in the Dominion.

"To obtain entrance to Canada today it is only necessary to possess $250 in actual cash. Many would-be British and Italian immigrants do not have that amount and are either turned down at a landing port or do not come to Canada at all.

"With the Jews it is quite different—they can all show their $250. The regularity with which each Jew produces the amount of his landing money has set the authorities thinking and they have come to the conclusion that there is an organization in existence for providing each Jew coming here with his landing money. On his arrival at his destination the $250 is handed back to the organization and is, so it is believed, sent out to Europe again to help another Hebrew enter Canada."

The *Living Age,* of Boston, prints this paragraph:

We are indebted to *L'Europe Nouvelle* for the following anecdote:

"Sir Philip Sassoon, who is now Lloyd George's secretary, was formerly the secretary of Sir Douglas Haig, from whom he received the following telegram last Easter Day:

"'Christ is risen. May want a secretary.'"

Marcus Loewe has opened 22 new theaters in the last twelve months, and has half a dozen more being planned.

The Jewish press has bitterly attacked Pope Benedict for his allocution with regard to the practices of the Jews in Palestine. Pope Benedict expressed the utmost concern for the course which affairs were taking in that country, where with a high hand the Jews were overturning every right and acting altogether like people who had just foreclosed a mortgage on a very desirable territory. What the Pope says is, of course, the plain truth. The better class of American Jews realize the situation but are powerless to better it, as was shown at the recent American Zionist convention. However, Zionism as at present operative in Palestine, constitutes the majority program in the world, and the efforts of far-seeing Jews to stem the errors are doomed to disappointment. Even in the United States, the squat, swarthy, anarchic Eastern Jew holds the reins of power, and really constitutes the Jewry that must be reckoned with.

Robert E. Simon, a New York real estate operator, appeared before Mayor Hylan with a proposal to sweep all the churches off Fifth Avenue. He said that the real estate values were too high to permit of churches longer occupying the ground. Mayor Hylan was rather wrathy in his reply and intimated that there were other things in life besides the almighty dollar.

Prosperity's Dependence on Agriculture

By E. T. MEREDITH

Former Secretary of Agriculture

THE farming industry of this country is of considerable proportions, representing an investment equal to that of all the railroads, all the manufacturing plants, all the mines and all the quarries in the United States. Essentially, it is the basic industry. The income from livestock and crops for a single year practically equals the entire national debt. In other words, agriculture represents a permanent investment of $80,000,000,000, and its output in 1919 was valued at twenty-five billions. The greater part of the output of this enormous enterprise comes almost to the door of American business. The manufacturers receive from it, directly or indirectly, the materials that go to make up their finished products. Bankers employ their deposits in facilitating the exchange between the two. The railroads and other carriers, including the comparatively new and important enterprise of motor transportation, have as their principal purpose the carrying of commodities from one to the other. The merchant has on his shelves many of the products of the farm, and with many of them, the farmer is the largest customer.

Importance Not Appreciated

TOO MANY persons, I am afraid, have failed to appreciate fully the importance of agriculture or their dependence upon it. This has resulted, in many instances, in lack of sympathetic understanding of the farmer's problems and of the difficulties confronting him not only in producing his crops or livestock, but also in the marketing of his products. Agriculture furnishes the basis of much of the business of the country. There are many industries which are entirely dependent upon it, such as the manufacture of farm implements and machinery, the packing houses, the grain merchants, and many others. Neither the business man nor the farmer, therefore, can be genuinely and permanently prosperous without the good will and the material aid of the other. Whenever a business man does anything toward making the agriculture of his section more profitable to the farmers, he does something which will help his own business, because there is not in the United States any business center that could continue to prosper independently of the farming communities surrounding it.

Recognizing these facts, I made it a part of my work as Secretary of Agriculture during the last year of the Wilson Administration to tell the story of agriculture to the citizens of America and to point out to them some fundamental points of contact between the two. It has seemed to me that, on the whole, we have given too little attention to public opinion as it relates to agricultural problems. Any misconception on the part of a large group of individuals as to the true function of public institutions relating to agriculture is almost certain to retard progress. Generally speaking, the consumer thinks that agricultural institutions, including the colleges and the Department of Agriculture, are maintained for the benefit of the farmer and for his benefit alone. This, of course, is not true. These institutions are serving, with a high measure of efficiency, the whole people, urban as well as rural.

During the past fifty years, the relative decrease in agricultural population and the increase in urban population has been very marked, yet the smaller percentage of persons engaged in agriculture has produced adequate supplies of farm products. Increased efficiency directly attributable to the work of agricultural institutions has certainly played an important part in bringing about this result. Everything done by them that has helped to increase production and to eliminate wastes not only has added to the farmer's income but has also benefited the city consumer. This fact, however, is not generally understood. One of the tasks ahead of us is to see that such an understanding is conveyed to the public; that it is demonstrated to the people in the cities, as well as those in the rural districts, that the funds devoted to agriculture are not used in the interest of the farmer alone but in the interest of the consumer as well.

Farmers Lose Five Billions

OUR great and basic industry is now laboring under many handicaps and, unless an active interest is taken by all our citizens in the problems of the farmers, the country may discover, in some not distant day, that the foundation upon which its entire business structure rests has been weakened. Although the farmers produced last year, in the face of enormous difficulties, the largest harvest in the history of American agriculture, with a single exception, the year's output was worth, at prices prevailing last December, five billion dollars less than the smaller crop of 1919 and three billion dollars less than the still smaller crop of 1918. No other industry or business could suffer a similar experience and avoid insolvency.

The situation which the farmers are facing now may have serious consequences, immediate and remote, to the nation. While there is, perhaps, no single solution for it, there are many steps that can and should be taken to place agriculture on a more satisfactory basis and to stabilize the business of farming—not in the interest of the farmers alone, but in the interest of the country as a whole. The matter is of such tremendous importance to our entire population that it should be recognized everywhere as a national problem and dealt with as such.

Life on the farm and in the rural community gives rise to problems the solution of which is of vital importance to American agriculture and American civilization. It has been demonstrated that these problems are susceptible of scientific investigation. Valuable studies already have been made, and they should be enlarged and others instituted, including especially studies relating to the human aspect of tenancy and landlordism, migration from farm life, population groups and community planning.

In our country, agriculture, manufacture, transportation, merchandising and professional service—strong competitors with one another for both capital and workers—are all expected to hold their own. The history of agriculture seems to show, however, that farming is in periodic danger of losing its grip on both capital and workmen and of allowing them to slip away into city industries. Statesmen have always viewed with alarm the tip of the scales from farming to industry and from country life to urban life. When the farm loses its balance to the city, the nation is threatened with a food shortage or with dependence upon foreign countries for essential foodstuffs. But the shortage of food is not the only danger. When American agriculture begins to lose ground, the political stability of the nation is endangered.

The real concern in America over the movement of rural population to urban centers is whether those who remain in agriculture after the normal contribution to the city are the strong, intelligent, well-seasoned families, in which the best traditions of agriculture and citizenship have been lodged from generation to generation. The present universal cry of "keep the boy on the farm" can and should be expanded into a great public sentiment for making country life more attractive in every way. Neither force nor exhortation will keep people in the rural districts if they are to be deprived of the benefits of modern social, educational and other opportunities. But when farming is made profitable and when the better things of life are steadily brought, in increasing measure, to the rural community, so that farm families need not give up farming in order to satisfy their desires for the best that modern civilization affords, the great motives which lead youth and middle age to leave the country districts will be removed. In order to assure a continuance of the best strains of farm people in agriculture, there can be no relaxation of the present movements for a better country life, economic, social, and educational. Country life has many advantages, but they cannot be sufficiently enjoyed without constant improvement in the living arrangements on the farms.

No more important problem confronts the agencies concerned with agricultural advancement today than the economic problem. This involves financial and commercial difficulties, which merit the people's attention.

The Financing of the Crop

THE financial problems of the farm have become more and more involved, until today they rank in importance with the financial problems of commercial industries. Tremendous sums of money are required every year to finance crop production and movement. Bankers have done many things to encourage agriculture. The entire commercial canteloupe industry of America, for example, was inaugurated by the bankers and business men of Rocky Ford, Colorado. The town was settling down into a rut of mediocrity, but in a few years it doubled in population and increased wonderfully in prosperity. The bankers who nourished the canteloupe industry in its infancy have received in increased business many times more than the sums they advanced.

I could take up pages of space in recounting the many activities of the bankers in financing all sorts of farming operations, and for every score of opportunities thus availed of, there are a hundred others knocking at the grated windows of American bankers. Apparently well-founded complaints have reached the department from farmers who have been denied credit for essential productive purposes while the producers of expensive luxuries and the dealers in them have been accommodated. I do not intend to imply that these bankers have maliciously chosen to handicap agriculture by the refusal of credit which they might have extended, but rather that they have yielded to the temptation of a larger immediate income from loans for less fundamental purposes. It is more than probable, however, that the bankers who have followed a short-sighted policy in such matters will, in the long run, be the losers.

A few years ago there was enacted by Congress a law known as the Federal Farm Loan Act, the fundamental purpose of which is to provide the farmers with farm mortgage credit, at a reasonable cost and on satisfactory terms of repayment, and thus to encourage land ownership by actual farmers and to decrease the percentage of tenancy. I do not need to dwell upon the importance of this measure and of the far-reaching influence of the system that has been developed under it. Unquestionably, it has been of immense benefit to farmers, but it is nevertheless true that the banking institutions of the United States are the largest single source of farm-mortgage credit. An investigation held by the Department of Agriculture four or five years ago indicated not only that the banks held more farm mortgages than any other class of institutions in the country, but also that a considerable percentage of the farm mortgages held by other agencies, as well as by individuals, was placed by them. They are in position, therefore, through wise and sympathetic handling of their farm-mortgage business, to play an immensely important part in the task of insuring the continued cultivation of a large part of our agricultural area by actual owners.

In addition to mortgage credit, there is frequent need on the part of farmers for short-time or personal credit. In the case of the man who owns and has paid for his farm, the supplying of such credit raises, as a rule, no serious problem. In the case of the renter, however, and of the young farmer who is just starting out as an owner, the question of short-time credit continues to be a difficult one. In such cases, bankers should realize that personal credit can and should be based, to a considerable extent, upon character and productive ability. To deny such credit to the honest, ambitious, energetic farmer because he has little tangible security to offer is to lessen the productivity of available capital and to discourage the man who in the future should be a land-owning farmer.

Because of the splendid security the farmer has to offer, because the farmer himself is a good risk, because the success of farming depends upon a sufficient amount of working capital, and because successful farming—and in the definition of successful farming I include profitable farming—is essential to the prosperity of the whole community, it is incumbent upon bankers generally to give to individual farmers who apply for loans the same consideration and the same service which they would give to any other class of business men.

Suggests Specialist in Bank

THIS leads me to suggest a plan which is already in operation in many country banks and which enables them to keep in close touch with farmers, to understand their needs, to assist them in various ways, and at the same time, to promote the business of the bank. This plan is the employment by their loan departments of a specialist trained in agriculture who will circulate over the county, get acquainted with farmers, attend their meetings, advocate improved methods of agriculture, and explain the banking business to them. Splendid results have been secured in this way by cultivating friendly relations with farmers, helping them intelligently in their problems and when they need financial accommodations, and encouraging them to build up a good bank account.

There is one fundamental and associated fact that I would like especially to emphasize, and that is, the farmer must receive adequate prices for his products, prices which will enable him to continue to produce, to secure a reasonable return for his efforts, and to maintain a satisfactory standard of living for himself and for his family.

Every business man, of course, is interested in keeping the farmer on the farm and in having the farm operated to its reasonable capacity, turning as much as possible into the channels of trade, manufacture and transportation, and this means that every business man should be vitally interested in seeing that the farmer gets fair treatment in the marketing of his products.

No more important problem confronts the agencies concerned with agricultural advancement today than that of marketing and distributing farm products. Until relatively recently the marketing half of the problem of farming received very little attention in any organized way. The lack of adequate transportation and credit facilities have intensified the problem, but, aside from these, there are other difficulties. The constantly increasing distances between our areas of commercial production and our centers of greatest consumption have complicated the situation. Until a few years ago, litle systematic work had been done looking to the improvement of our marketing processes. Now the Bureau of Markets is actively at work along this line.

No one will deny, I am sure, that it would be wise to concentrate the best brains of the country upon the vital problems of agriculture and to provide the Department of Agriculture, with its 20,000 employes of which 4,000 are in Washington, and the agricultural colleges and experiment stations with adequate facilities for carrying on their work in the most effective manner. And yet these institutions are being constantly weakened by having many of their best scientific and research workers taken away from them by private concerns who can afford to pay them better salaries—often three and four times as much as the government can offer them. The scientific worker ordinarily does not expect the government to pay him as large a salary as he can secure in private employment. He is usually willing to accept less in order that he may remain in strictly scientific work. The government should be in a position to retain its scientific and technical workers over long periods.

Find Out What Farmer Thinks

WHAT we should know is what the farmers, as a whole, think. How are we going to find out? I have heard members of Congress say that they could not find out where the farmers stood on questions relating to agriculture; that they wanted to serve the farmers but that they could not find out what their views were. When business takes a referendum through the United States Chamber of Commerce, one knows whether ninety or eighty or sixty per cent or whatever the percentage may be, of those in the North, in the South, in the East or in the West, are in favor of the proposition involved. One can learn what business men think about the Federal Reserve System or the Shipping Board, for example.

But what do the farmers think? Each organization has its particular problems, and each has its place, but it seems to me that there should be some central clearing house through which they could all work together. If one wants to know what the farmers think now, ten or twelve different views must be secured and then make a choice. That is not good business or efficiency. It does not serve the best interests of the farmers.

To my mind, the establishment of a national chamber of agriculture would be one of the greatest services that could be rendered to agriculture, and, in the end, to all the people.

The Oom-Ta-Tas Come Into Their Own

By JOHN B. WALLACE

THE town band was ready to begin its weekly rehearsal in the dingy loft over the hardware store. The alto player, who was also the secretary and librarian, had passed out the music and the boys had turned to number seven in the blue book, one of George Southwell's immortal compositions.

The leader, who when not directing harmony was the pharmacist in the local drug store, tapped on his music rack with his baton and glanced impatiently around the rude benches upon which the musicians were seated.

"Now where in the name of Heaven is that condemned snare drummer?" he peevishly inquired. "That boy is always late. No brains at all."

"Of course not," agreed the baritone player. "If he had any brains he wouldn't be a good snare drummer."

I really am going to treat this subject seriously because it is a subject worthy of serious treatment. The small town amateur band is not only the most typical institution of our democracy today but it is the corner stone upon which our national musical edifice of the future will be builded.

Men who play in amateur bands are actuated by a number of motives. Some of them, especially the younger generation, are impelled by a desire to show off, to parade around before their fair friends in a uniform.

Others, principally the married members, seize the opportunity as a respite from the family circle which in long winter evenings is apt to pall upon one with a fertile imagination and an active temperament. But behind it all, young and old members alike, is an inherent love of music, a desire to bring forth harmony which must find expression even through the medium of a column of air propelled through a horn.

Nearly every small-town band has its hopeless dub, an individual who could never learn to produce a musical tone or execute a measure properly if he lived for a thousand years. But the band will put up with him, allow him to hold them back, for a band like a chain is only as strong as its weakest link, because they recognize within him, despite his inability to bring it forth, a craving for musical expression. And besides, it is almost impossible to get rid of one of these lads short of actual deportation. I remember one band that disbanded and reorganized five times in an effort to freeze out a would-be trombone player but they finally had to give it up as his uncle owned the only building in town that could be used for rehearsals.

The members certainly cannot be accused of belonging to a small-town band for pecuniary reasons. As a rule they are not only compelled to buy their own instruments, their uniforms and music but often they dig down in their pockets to pay their leader if it so happen that he be an outside professional. Upon every public occasion they are expected to turn out gratis. If they should have the temerity to demand a small honorarium upon such occasions as Decoration Day and the Fourth of July they are denounced as lacking in patriotism and public spirit and the committee selects a chorus from the high school to furnish the music.

Sometimes the band by giving entertainments and concerts is able to raise enough money to purchase uniforms without drawing upon the personal funds of its members. This, however, is only at the sacrifice of its independence, for from then on every person in town who bought a two-bit ticket feels at liberty to call out the boys for each wedding, funeral or similar festival that takes place for the next decade.

Dances are usually the most prolific source of revenue for the band boys but even here they are apt to run against a strong sentiment of opposition from the churches. There was a time in the not distant past when the church looked with strong suspicion on anyone who played a horn. He was suspected—sometimes not without reason—of having rakish tendencies and of being inclined toward taking a hand at seven-up or shooting a game of pool.

But the old order has changed. Since Billy Sunday started rampaging around the country preaching hell fire and damnation to the accompaniment of a slide trombone, the churches have taken a different attitude toward the band boys. The church or Sunday school that does not have its orchestra with a liberal sprinkling of brass is the exception. The preachers now are our best friends. They invite us to play in their churches and they boost vociferously for our concerts.

Political campaigns sometimes afford the town band a chance to get its hands on some real money. Candidates with a large sack and an open heart will engage the Silver Cornet Band to play in front of the town hall in order to draw a crowd for the subsequent rally. These windfalls are none too plentiful and furthermore the boys have learned from bitter experience to demand their money in advance.

Politicians are notorious for their short memories. The defeated candidate after election feels that settling for unpaid campaign expenses is too much like paying for a dead horse while the successful ones once safely settled in office are inclined to let some one else do the worrying.

The band in a small town takes the place of a social club. Drawn together by their common love of music it exercises even a stronger tie than does the fraternal order or lodge over its members. A man will miss meeting after meeting of his secret order but he cannot miss many band rehearsals and remain a member of the organization. He takes no oath but there is an unexpressed obligation which few men will disregard. Here both duty and inclination call him.

The small-town band has more than a sprinkling of the live wires of the community. There are always a few members whose only bid for recognition is their ability to perform upon their chosen instrument but the majority are what might be called all around good citizens perhaps a little above the average run in intelligence. There you will find the cashier of the bank manipulating the keys of a clarinet, the dentist drawing soulful sounds from a flute, the rising young attorney blowing a cornet, the butcher puffing into a tuba and the town barber pecking away on an alto.

Top—Geary Avenue grammar school band, Pomona, California. None of the boys in this band are more than 13 years of age. Center—High school band at Chaffey Union High School, Ontario, California. Bottom—Upland Band at Upland, California, a town of 2,000 inhabitants that has one of the best amateur bands in the state. Four members were absent when this photo was taken.

Many a suggestion for the improvement of the community is made and got under way at band practice. In many ways the band functions as a local commercial club or business men's association. This is recognized in the almost universal custom of judging the progressiveness of a town by the size and ability of its band.

Another element that adds freshness and life to a small-town band is the wandering musician, the drifter. Ability to play a horn or a reed instrument is a distinct asset. It often lands a man a job where otherwise he would be kicked out as a hobo. There is always room in a small-town band for another player. Let the stranger venture into the hall on rehearsal night and let his talent be known and every man in the band constitutes himself a committee of one to locate the visitor a good paying job. There is a freemasonry among bandmen that perhaps does not exist as strongly in any other craft or profession.

These men with their tales of travel and experiences in other bands are a new source of entertainment to their fellows. Usually they remain a season and then drift on again. Sometimes they meet town girls who capture their hearts and they marry and settle down into staid and substantial citizens. Occasionally they abuse the confidence and trust placed in them and, after borrowing right and left, skip out leaving a trail of I. O. U.'s behind them.

The influence of the town band upon the music of the country is little realized by those who have not given the question thought. A study of the records of the big music and instrument houses of the country would give you a better idea of what I mean. In the world of music, the town band bears the same relation to the professional as the sand-lotter in baseball bears to the big-leaguer. If it were not for the corner lot development of the ball player there would be few players in the big leagues today. And if it were not for the small-town band our professional ranks would have to be entirely recruited from the musicians of Italy, Germany and France. I have no quarrel with these foreigners. They have exercised a splendid influence over the music of this country. We owe them more than we can ever repay. But it is not to them we must look for the development of our national music; it is to the American-born musician, the product of our own environment and institutions.

The small-town band not only develops players of strictly band instruments but it has a strong influence in the advancement of string and the voice. Every town that has a band has an orchestra and the latter is usually composed largely of band members many of whom double in string. Every youngster that shows talent on violin or piano or reveals a voice of unusual quality comes under the notice of these men. The advice, encouragement and oft-times financial assistance given these youngsters and given at the crucial time when a wrong step might mean the blasting of a career, has been the making of many a star in the musical firmament.

These men, too, are the backers and boosters of all high-class musical entertainment in their own town and organize the excursions for the purpose of hearing grand opera and noted concert singers and players in near-by cities. Through their efforts and influence, the musical taste of America is slowly but surely being raised.

This statement may not seem to accord with the present craze for jazz but it is a fact nevertheless. I am not one of the Puritan highbrows who elevate their digits in holy horror whenever jazz is mentioned. Syncopation has been used by some of our greatest composers. It is centuries old. It has a recognized place in music. It is only when it is carried to the extreme, run into the ground as it were, that it becomes distasteful. We must remember that the chief value of music lies in its interpretation of moods. Our fad for jazz today is but the expression of a certain mood of the American people. Fed up on the horror and tragedy of war they have turned to the sonorous barbarism of jazz. But jazz is not the true expression of our national temperament, and it will pass with the passing of the mood that it expresses. Just as Verdi interpreted the vivid emotionalism of the Italian, as Wagner interpreted the martial ardor and heavy sentimentalism of the German and Saint-Saens the light-hearted cynicism of the French, so will an American composer be born who will portray the practical idealism of the real American. And I venture to predict that he will come from the ranks of the small-town musicians.

Just as America is made up of a composite of all the nations of the earth, so will our music be a composite. But it will be a composite that will possess an individuality of its own that will make it recognizable as American wherever it is heard. Glance at the program at the next concert of your home-town band. Note the diversity of selections. You will see composers of every nationality represented. The grade of the music will be determined by the ability of the performers and the experience of the leader but the program will be cosmopolitan. The small-town musician is your true internationalist. He takes the best in music from all countries. In this respect racial prejudice does not exist. During the Word War, in deference to the sentiment against German music, very few bands put any Teutonic numbers upon their programs. But every true musician—loyal patriot as he was—in his heart secretly resented this concession to prejudice. He felt that music had no national or sectional boundaries and that every great composition, like every great painting or great piece of literature, belongs to the world.

As illustrating the catholicism and the high grade of music now being played in the small towns of the country, take these two programs selected at random from a list of summer concerts. The first program was played by a band of eighteen men, all amateurs, living in a town of less than three thousand inhabitants.

March—"Canton Halifax" ..... *Hall*
Sextette from "Lucia" ..... *Donizetti*
Waltz—"Civilization" ..... *Pestalozza*
Fantasia—"Old Kentucky Home" ..... *Dalby*

One Hundred Days of Harding

Concluded from page 6

marvelous, if one would remember the popular theory a decade ago.

Representing as he does the plutocratic class, to use a former spellbinding term, the selection of one of the country's richest men as Secretary of the Treasury is a good omen for constructive America. At least, it augurs a healthy state of mind toward material success. For the first time politics has not outlawed wealth, which, deified by the common people, has been disparaged and jeered by politicians posing as reformers. Occasionally a rich man or one identified with big business has sat in the Senate or become invested with diplomatic regalia, lampooned as the "tool of predatory interests"; an ikon for votive adjurations in the name of a proletariat that owed consequent national atrophy to its own indifference. It is this indifference—this inconsistency between the national spirit of this business nation and its success-penalizing fashion in government—that President Harding seeks to destroy by his precedent-shattering selection. Is there a faithful Democrat who can imagine a half-billionaire in the Cabinet with the approval of a Wilson or a Bryan?

President Harding has gone even further. He has been host to a group of leading financiers who easily represented two-thirds of the nation's wealth. It was a coup that out-Roosevelted Roosevelt. Wall Street has been laughing about the dinner, because it is considered there a good joke on politicians, but for once the politicians—that is to say, the responsible leaders—have refused to become stampeded and to take the bankers seriously.

Wall Street Aid a Snare

AMERICAN foreign relations are essentially business relations; the question of the peace resolution and collateral treaty is an incident, as was the war. Yet there is a disposition in certain quarters to prevent the war from being forgotten.

If the President hopes for aid from Wall Street in solving the more pressing economic questions agitating the nation then he is heading for delay. His only recourse is to go directly to the people, with the help of those captains of industry who do not figure at all in Wall Street but who are, as they consistently have been, pioneers in foreign trade through the medium of their own wares. The bankers, looking for percentage profits, have secreted away all the money available, to collect the dust and cobwebs, maybe, that once graced bottled goods.

It may be possible to relieve the economic difficulties of the day from within, but the nation will never be prosperous without its adequate marketed export surplus. Emergency and permanent tariffs lead nowhere. They ease with the same impartiality that they restrict. Emergency legislation cannot be considered constructive legislation, and certainly is not a solution.

With due allowance for all the complexities involving many inherited policies, constructive statesmanship has been at a standstill.

The President wants a safe and sane Republican party, but commendable as is his goal, it is likewise dangerous, in that he must eventually answer for himself and his party. The party, on the whole, is not moving on smoothly, but in a series of jerks. It may be the executive brake and it may be something else.

But something must be done, in the light of recent slowness in Washington, to show a "record" at the Congressional elections fifteen months hence.

When that time comes the administration must be ready to report something definite about peace with Germany; it must have withdrawn every soldier in Europe, whose presence there has not been satisfactorily explained by either Democrat or Republican to date; it must show economical management not by an array of figures but in decreased taxation; a comparative statement of "business in government" will be necessary.

A tempest in a teapot has been started with regard to disarmament. Now Senator Borah may not have found the right plan, but it cannot be gainsaid that he has the right idea. Yet on his account there has come very near one of those impalpable demonstrations about congressional and executive prerogative. Is it supposed that the people are worrying about any such futile technicalities?

What they want to know is what is going to be done about American loans to foreign nations, which are costing this country a million dollars a day or so of uncollected interest, with nothing apparently being done to collect it and certainly nothing at all, according to a recent Treasury announcement, about transforming that huge principal into a negotiable asset.

Disarmament? It can be brought about on the double quick if this country decided forthwith that it must have its interest charges, which are being deviated into militaristic expenditures by the indebted powers. It will be found that foreign nations will be less apt to continue a race for armed aggrandizement if they are compelled to pay their debts first, but why should they worry with such an accommodating government?

Difficult? Of course it is difficult to insist upon payment, to risk offense; maybe it is even more difficult to obtain payment. Yet it means statesmanship and it is action. It requires imagination, push, agility, firmness, and it requires, above all, a courageous disregard of the obsolete albeit pleasant habit of laborious red-tape circumgyrations.

Of one thing I am certain; that few officials understand the mood of the people. It is a mood that has nothing in common with politics, with partisanship, with heroes, with leaders. It is a mood that will be difficult to combat even on the basis of the utmost possible achievements by the Administration.

Coming Election Test

THE Congressional elections next year will include some of the most noted names of both Houses. It is unlikely that the most prominent members will be retired but the Republican party, despite a handsome majority, cannot afford to lose even one seat—not next year, anyhow. And there are serious thinkers who declare that if the Administration does not gain one seat next year it has failed in reaching the people. It may be so and it may not be so, but this comment is worth thinking about.

To be precise, the voters prefer speed just now at any cost. They are not sympathetic with an ultra-conservative policy. The world moves too fast for them, and the cost of living makes Saturdays come around much faster than of yore. There were already too many conservatives in Washington, and it was not a good thing to add others. The campaign was a most unconservative affair. It hinged upon action. It thrived on action. It was decided by action. And nothing less than action will satisfy. Action is what the people want.

There are too many conferences; too many meetings; too many alterations; too many investigations; too many plans; too many promises; too many speeches; too many dinners; too many generalities, and too many ovations.

What People Want

TO REPEAT, it is only due the President to think of him for the time being as a regent, and therefore entitled to unravel his official way out, but this, however, will not serve as a reason for the administration's excess of conservatism and its predilection for settling abstruse subjects that can well be put off until next year or decade. Unless the G. O. P. ship unfurls its sails along new routes it is not going to accomplish anywhere near its program of reconstruction. Just now it is rather busy with correcting or altering existing unsatisfactory conditions, but the people are harsh masters and want something better than warmed-over policies.

It may be taken for granted that these observations will be considered premature and as disregarding the inclusive warning against haste in reaching conclusions. So the writer begs to explain that these are not his own personal views, but the result of reportorial investigation. They combine into a tentative judgment as of the time of writing, on the basis of one hundred days of Harding, in which neither party nor individual has been considered. It is the approximate measure of the situation in the middle of June.

I have taken the criticism of Republicans against the criticism of Democrats. Yet it would not be amiss to point out that on the two or three occasions, both in the Senate and House of Representatives, when representatives of the minority rose to berate the Administration for its complacence, Republican spokesmen remained silent. It is something new, this silence, in no wise related to the generous superiority usually displayed by the majority toward the minority.

The Oom-Ta-Tas Come Into Their Own

Concluded from page 11

The second program was played by a band of twenty-two men in a small city of 14,000. All of these men were amateurs, engaged in other occupations, except the leader.

March—Tannhauser	*Wagner*
Overture—Tambour Der Garde	*Titl*
Valse—Adele	*Briquet*
Pas des Escharpes, scarf dance from the ballet	
Symphonique "Callishoe"	*Chaminade*

—Intermission—

Selection—"The Fortune Teller"	*Herbert*
"Misere" from "Il Trovatore"	*Verdi*
Fackeltanz in B flat	*Meyerbeer*
"Marche Slav"	*Tschaikosky*

Star Spangled Banner

The leader of the first band taught music in the local schools. The leader of the second, an Italian, was a retired professional.

The occupations of the men who played in the larger band were as follows: Solo cornet, foreman in a packing house; assistant solo cornet, night watchman in a gas plant; first cornet, proprietor of a shoe repairing establishment; baritone, retired army musician; first trombone, truck driver; second trombone, baker; third trombone, cashier in a building and loan association; first horn, rancher; second horn, electrician; both tuba players were engineers; solo clarinet, beekeeper; assistant solo clarinet, painter; first clarinet, an orchard pruner; second clarinet, employe electrical appliance factory; flute and piccolo player, gardener in city park; oboe player, piano tuner; snare drummer, janitor in church; bass drummer, secretary of local chamber of commerce. Can the reader imagine a more Democratic organization or one more truly representative of America?

The influence of the small-town band is being felt today in our public schools. Thirty years ago a school band was almost unheard of and the teacher who would have attempted to introduce instruction in band music would have invited a storm of criticism. Today there is hardly a school or college in the country that has not its own band, and in most cases a good one. I know of even a little desert town in Nevada that has a public school band numbering forty pieces. The schools share with the small-town musical organizations the honor of being the breeding place of the future American composers.

I have found a surprising ignorance among the best patrons and friends of the small-town band as to the function of each of the various instruments and their relation to the whole.

The average small-town band is, roughly speaking, divided into three sections, namely: the reed, the brass and the percussion. Some of the larger bands also have string instruments but these are rarely found except in the Southwest where Spanish influence makes itself felt.

The saxaphone is the newest of the reeds and has come into great popularity through the craze for jazz for which it is particularly suited. Most band men are inclined to hold it somewhat in contempt, classing it with the ukelele; but in the hands of a competent performer it greatly aids in lending color to a band.

It is teamwork that makes a band, just as it makes a baseball nine or a football eleven. A good director can get better results with a band of mediocre performers than a poor director could with an organization composed of the best individual players in the country.

We are breeding some mighty good directors and composers in our small towns today. When next you hear your home-town band perform remember the advice given on a sign I saw hanging over the piano in a saloon in Alaska. "Don't shoot the piano player. He is doing the best he knows how!"

Your Own United States

For many years poets have told of "bearded oaks" but unless one has seen the giant oaks of the South draped with Spanish moss, he cannot understand why such a term should be used. In St. Augustine nearly every giant oak is draped with Spanish moss. In the country it is stripped from trees and sold. Many a "hair mattress" is filled with this Spanish moss. This moss grows to the length of ten or twelve feet and from ten to a hundred "beards" will be suspended from one limb. The giant oaks are covered with it, yet it does not sap their vitality.

Fiction-Historian of Western Pioneer Life

Haying Time

HAYING was the one season of farm work which the boys thoroughly enjoyed. It usually began on the tame meadows about the twenty-fifth of June, and lasted a week or so. It had always appealed to Lincoln, in a distinctly beautiful and poetic sense, which was not true of the main business of farming. Most of the duties through which he passed needed the lapse of years to seem beautiful in his eyes, but haying had a charm and significance quite out of the common.

At this time the summer was at its most exuberant state of vitality, and it was not strange that even the faculties of toiling old men, dulled and deadened with never-ending drudgery, caught something of exultation from the superabundant glow and throb of Nature's life.

HAMLIN GARLAND

The corn fields, dark green and sweet-smelling, rippling like a sea with a multitudinous stir and sheen and swirl. Waves of dusk and green and yellow circled across the level fields, while long leaves upthrust at intervals like spears or shook like guidons. The trees were in heavy leaf, insect life was at its height, and the air was filled with buzzing, dancing forms and with the sheen of innumerable gauzy wings.

The air was shaken by most ecstatic voices. The bobolinks sailed and sang in the sensuous air, now sinking, now rising, their exquisite notes ringing, filling the air like the chimes of tiny silver bells. The kingbird, ever alert and aggressive, cried out sharply as he launched from the top of a poplar tree upon some buzzing insect, and the plover made the prairie sad with his wailing call. Vast purple-and-white clouds moved like bellying sails before the lazy wind, dark with rain, which they dropped momentarily like trailing garments upon the earth, and so passed on in stately measure with a roll of thunder.

The grasshoppers moved in clouds with snap and buzz, and out of the luxurious stagnant marshes came the ever-thickening chorus of the toads and the frogs, while above them the kildees and the snipe shuttled to and fro in sounding flight, and the blackbirds on the cat-tails and willows swayed with lifted throats, uttering their subtle liquid notes, made mad with delight of the sun and their own music. And over all and through all moved the slow, soft west wind, laden with the breath of the far-off prairie lands of the West, soothing and hushing and filling the world with a slumbrous haze.
—From "Boy Life on the Prairie," by Hamlin Garland.

"THERE is a divinity that shapes our ends." Hamlin Garland, poor and unknown as a writer, left Boston in 1887 to revisit the home of his father in wheat-fielded Dakota. He stopped in Chicago to meet Joseph Kirkland, whose novel "Zury" he had reviewed. Mr. Kirkland had read some of Mr. Garland's western sketches and saw the neglected opportunity.

"Why don't you write fiction?" demanded Mr. Kirkland.

"I can't manage the dialogue," replied the twenty-seven-year-old teacher.

"Nonsense! You're lazy, that's all. You use the narrative because it is easier. You must emotionalize western life. A great opportunity is open to you to picture the trials of these pioneer people of the Middle West among whom you have lived."

That was the conception that sent Hamlin Garland up the literary ladder. Leaving noisome Chicago, every field along the railroad took on a new meaning. Forgotten were the warmed-over themes of his Hawthorne and Whittier. The weed-fringed country roadsides, the drab, sun-blistered depots, the brave farmers bent with toil, the loading of the hay and the harvesting now became significant. Here was a life that he knew—a pioneer country life of hardships; a new nation building; immigrants moving in caravans into the mighty places of the West. These he would portray.

From this chance admonition grew "Main Traveled Roads" which indelibly limned farm hardships now vanishing; sacrificing mothers, patient amid squalid surroundings, and fathers and son to whom the performing of difficult farm work was like the winning of college athletic laurels by their grandsons today.

The landscape of Western Wisconsin where Mr. Garland was born on a farm in 1860, near the present site of West Salem, is the most attractive part of the state. Exposed rocks and wind-swept cliffs give the appearance of ruined structures. The castellated heights are not as majestic as mountain scenery; there are no deep, cavernous gorges nor pent-up fretted streams that come chafing their rocky channels. But the landscape is boldly marked. Here spread hillsides of green, like carpets of velvet from the trains, streams crystal and placid, and clumps of trees dotting slopes with rich pasture lands watered by small streams that wind their way through hayfields. Up the coulee, weather-beaten, chiseled rocks crown escarpments, lending a mysticism of delusion and fantasy to the scene. This valley in which Mr. Garland spent his boyhood is still called the "coulee." In the years to come it was celebrated by him in many of his short stories and novels that have touched the heart and caught the fancy. He is the fiction-historian of the western pioneers.

"My Wisconsin birthplace has always been a source of deep satisfaction to me," said Mr. Garland recently. "That a lovely valley should form the first picture in my childhood memories is a priceless endowment. It doesn't matter so much what Green's Coulee looks like now nor what it looked like to grown-ups in 1865, it will always remain a charming and mysterious place to me.

"It is still very vividly in my mind. I have but to close my eyes to the present, and the tiger lilies bloom again in its meadows, the mowers toss up once more the scarlet sprays of strawberries, the blackbirds rise in clouds from out the ripening corn, and a hundred other sights and sounds equally beautiful and equally significant, fill my inner vision.

"In West Salem I saw my first circus. My first regular instruction was given in an Onalaska school, and my first notion of the outside world was derived from the sight of La Crosse and the grandly impressive Minnesota bluffs which stood to the west.

"The men and women who were our neighbors in those far days had a quality which made them heroic in my eyes, and as I think back to them now I perceive that they were, in truth, a cheerful and powerful as well as an intelligent group of genuine Americans. They could laugh and they could sing. They confronted the future with confidence, for the war was over and Uncle Sam was rich enough to give every man a farm—if he would go and get it.

"Work was a kind of game in which these strong young fellows contented, Dudley against a Garland, a McClintock against a Green. The faces of the threshers were jovial, the voices of the corn huskers merry. Why? Because they had vitality to spare. Nothing could subdue them to sullen drudgery.

"For all these reasons the reader of "A Son of the Middle Border" will find a note of hero-worship running through all the chapters which deal with early life in The Valley. There is nothing commonplace in those early memories. Green's Coulee belongs to the semi-mythical age of the world—to me. That others feel much as I do about those pioneer days is made evident by the many letters which are coming in to me from other Wisconsin homes."

Richard Garland, the father, was a pioneer, an explorer. For him the cramped hillsides of the coulee and stony fields had lost their charm and in 1868 he joined the caravans moving westward. The free lands

By FRED L. HOLMES

beckoned and he took up his new home in Winneshick County, Iowa, and a year later moved on to the prairie in Mitchell County, the scene of Mr. Garland's "Boy Life on the Prairie" and many of his sketches in "Main Traveled Roads." When about sixteen years of age he became a pupil in the Cedar Valley Seminary at Osage and was graduated in 1881. Then for a year he tramped through the East, while his family again caught in the western movement trekked into South Dakota settling in Brown County. These were days of indecision and trial for Hamlin.

"It was back in the early spring of '82 that I had a little job in Madison, Wisconsin, in a little machine shop or something of the kind," Mr. Garland told me. "I was general clerk and office boy. At that time there were very few typewriters, and so they wrote with a sort of analine ink that printed from one page to another when pressed together. That was one of my duties.

"But I left there suddenly," smilingly added Mr. Garland. "The man just above me was a tall gangling blond, and as I was probably a little older than he, I resented his petty commands. I was out of work three days and went to the river to get a job cutting ice. It was bitter cold. I watched and envied the men who had work. You see, I was getting down to my last dollar."

About this time his brother appeared on his way to Valparaiso, Indiana, to attend school and offered to finance a series of lectures which were the beginning of Mr. Garland's career.

Still undecided Hamlin again returned to the family roof and took up a claim in Dakota in 1883 in McPherson County, where he lived a few months. This he sold at the end of the year and determined to return to Boston to fit himself as a teacher. From this experience on the plains was later to come "The Moccasin Ranch," and several of his short stories.

Friends are helpful. In Boston Mr. Garland became a pupil under Professor Moses True Brown of the Boston School of Oratory. So diligent was Hamlin in his studies that he soon was selected as instructor and during the year 1885 and 1889 he taught private classes in English and American literature and lectured in and about Boston on Browning, Shakespeare, the drama and other literary subjects. It was through his school and lecture connections that he became acquainted with Oliver Wendell Holmes, William Dean Howells, Edward Everett Hale, Edwin Booth and other leaders in literature and art.

Poverty had pinched him, but could not still his ambition. Finally in 1887 he had saved enough money to return for a visit with his people in Dakota and it was upon this chance journey that he received the inspiration from Joseph Kirkland to portray western characters in the embodiment of fiction. In 1890 he published "Main Traveled Roads." The next year he again visited the West and wrote his first long novel, "A Spoil of Office."

"Rose of Dutcher's Cooly," published in 1895, is a significant title referring to his old western home. Then he spent two years writing a life of General Grant which stands as an historical masterpiece. In 1898, immediately after completion of Grant's life, he went into the Yukon Valley overland. This trip formed the basis of a novel, "The Trail of the Gold Seekers." Since then the following books have been published:

"A Captain of the Gray Horse Troop," "The Light of the Star," "Hesper," "Money Magic," "The Shadow World," "The Eagle's Heart," "Cavanaugh, Forest Ranger," "Other Main Traveled Roads," "The Long Trail," "Victor Olnee's Discipline," "The Forester's Daughter," and "A Son of the Middle Border."

For the past four years Mr. Garland has been working on a second volume of autobiographic material under the title, "A Daughter of the Middle Border," which he expects to bring out upon his next birthday, the fourteenth of September. This book is intended to answer the thousands of questions he has received from readers of "A Son of the Middle Border," and brings the family story down to the breaking out of the Great War in 1914. These volumes form a kind of intimate social history of the period between 1865 and 1914.

Nearly twenty years ago Hamlin Garland purchased a house in the village of West Salem, Wisconsin, which he still maintains. To this home back at the edge of the coulee he brought his mother and father to spend the remaining days of their lives. His father submitted rather stubbornly, but soon was happy at being surrounded by the farmer folk, hearing from their lips the quaint melodies and stories of farm progress.

His mother and father were pleased with their new home. Then Hamlin went into the world to make a home for himself. In 1899 he married Zulime Taft, sister of Lorado Taft the sculptor. They have two daughters, Mary Isabel and Constance Hamlin.

In recent years the summers of Mr. and Mrs. Garland and family have been spent in the Catskill Mountains, about 140 miles from New York. He owns a small cabin in Onteora, a literary and artistic colony, and spends nearly four months of the year up there. The cabin is at an altitude of two thousand feet above sea level and is of particularly stimulating atmosphere. Round about have been gathered all of the material that touches upon the Middle West and in the quiet of his home he is weaving the story of these people into an indelible history.

While there is a variety of characters and studies in the novels of Hamlin Garland, he stands out pre-eminent in the works which visualize western pioneer life. Mr. Garland is a striking figure upon the lecture platform. Tall and slender, a bushy, drooping mustache, think heavy eyebrows, a face deep lined, and a head crowned with silver and gray hair, he makes an interesting and picturesque lecturer. Recently he was speaking to a college audience, telling of stories of his pioneer life and the early trials of his family and neighbors. The portrayal was a bold contrast to the life of the audience before them. With tenderness and pathos he described the advance of the frontier—the first explorers, men who were ever anxious to move onward into the wilderness. Not so the women.

Then he sang for the audience the songs of his mother and father back on their Wisconsin farm before leaving for Iowa and the Dakotas. The father's was a pleading song to advance, the mother's a tender, appealing plea to remain with friends and family where settled. The sentiment in both gives a picture of the unrest on frontier:

"Away to Colorado a journey I'll go,
For to double my fortune as other men do,
While here I must labor each day in the field,
And the winter consumes all the summer doth yield,'

To this his wife replies:

"Dear husband, I've noticed with a sorrowful heart
That you long have neglected your plow and your cart
Your horses, sheep, cattle at random do run,
And your new Sunday jacket goes every day on.
Oh, stay on your farm and you'll suffer no loss,
For the stone that keeps rolling will gather no moss."

Here Mr. Garland sang the melody first in the deep tone of his father and then came the sweet tender reply of his mother. It was a picturesque and striking scene.

Caught by the sympathy and the feeling of these people, he is able to picture the life of the great West, its mighty prairies, its broad rivers, its endless acres of wheat fields waving in the sunlight and the grandeur and the mightiness of the plains. To all these phases of western country life he has given a breath of realization.

Lives in Royal Castle His Pay Is $4 a Week

NOT many persons may have their mail addressed to Windsor Castle, but there's one man who has lived in that royal dwelling for 15 years; and his pay is a trifle less than $4 a week.

No, he is not the second assistant janitor, nor the gardener's "boy"; he is the librarian, by courtesy, and his real task is writing a history of the British Army, on which he has been engaged for 20 years.

A recent interview, his first, was occasioned by the publication of Volumes IX and X of this monumental "History of the British Army," the volumes covering the close of the Peninsular War and the Waterloo campaign. To many people the appearance of the volumes, and the reviews of them, afforded the first knowledge of the existence of the Honorable John Fortescue, burrowing away into his records in Windsor Castle.

The work is admittedly the finest military history ever produced; and it will take five more volumes, he says, to bring it down to 1870. The historian's own comment on it is this: "I should have done better for myself financially if, instead of devoting more than twenty years of intense labor to this book, I had served for the same period as a private in the infantry of the line." A private in the infantry of the line used to get 25 cents a day, "and all found," with special field allowances, and, of course, more money with promotions, and an increased scale during the late war. Actually Mr. Fortescue gets fourteen shillings a week which, at the pre-war rate of exchange, is $3.36.

Mr. Fortescue was 61 years old on December 28 last, too late, as you will note, for him to change his life and prospects. He was the fifth son of the third Earl Fortescue, and younger sons of British titles get the prefix "honorable" and very little else. His whole life has been devoted to military history and, among other honors, the University of Edinburgh gave him an honorary Doctor of Laws, and Austria made him a Commander of the Order of Franz Josef. Also he holds the Chesney Medal.

His first important work was a history of the famous Seventeenth Lancers, published in 1895, followed a year later by "Dundonald." He began the History of the British Army in 1899, and was on the point of abandoning the work for lack of personal subsistence in 1905, when King Edward came to the rescue and appointed him librarian of Windsor Castle, which gives him living quarters and $3.36 a week.

In 1907 he was made a Member of the Victorian Order, an honor that added nothing to his income. But in 1914 he married the daughter of a Suffolk clergyman, and his wife, according to his own confession, has kept him to the task and, to make it possible, has opened a dress-designing and house-decoration business.

The problem is this: Does residence in Windsor Castle on next-to-nothing compensate for the devotion of a lifetime for a posthumous fame which may or may not materialize?

DEVESAGO FALLS, at Prattsville, in the Catskill Mountains.

Your Adopted Child and the Law—By WILLIAM C. DUNBAR

A VERY unnatural and extraordinary thing occurs when a child by law ceases to be a member of one family and becomes a part of another. The deepest relationships of life are changed by the process. Before the adoption, the natural parents had full control of the child and were under obligation to provide for it; and on the other hand, the child owed its parents respect and obedience. It bore their name and had the right to inherit their property. After the adoption proceedings have taken place practically all this is changed. The natural parents have no longer any control over the child and are relieved of all responsibility for it, and the child is not under any filial duties toward them.

It is small wonder, then, that the courts are strict on insisting that any one wishing to adopt a child must comply with the law in all respects. Yet many persons adopt children without the precautions necessary from a legal standpoint. If they were buying a house they would want to be sure that the title had been examined and approved by a competent attorney; but they will adopt a child, which is a matter of vastly more importance, without proper investigation or legal advice. They seem to think that if they can get the papers drawn up and approved by the court that everything will be all right. But this is not necessarily so, and the court itself will have no right to act unless the steps prescribed by law have been taken. So adoptive parents are sometimes shocked to find that notwithstanding adoption proceedings, they have no legal right to the child and must give it up after they have acquired an intense affection for it. They may learn, for instance, that the person or institution agreeing to the adoption had no authority to do so. Perhaps the mother alone had agreed when the father was living and should have been consulted, or the child may have been taken from the natural parents without proper notice having been given them. Possibly the child was adopted in the wrong county or the papers were not complete or were improperly drawn. There are so many chances for mistakes and omissions, and the resulting disappointment and grief are so keen that the greatest care should be taken in the beginning to see that everything is done in strict conformity with the law.

People sometimes take children into their homes with the idea of adopting them later, relying on the word of the natural parents that formal consent will be given to the adoption. After much love and care have been bestowed on the child and perhaps considerable expense incurred in its support, it is found that this consent cannot be secured as the parents have changed their minds or have perhaps disappeared or died.

In a recent case which came to my attention, the mother died at the time her child was born, and her brother and his wife took the baby into their home. I advised the brother to get, if possible, the father's consent to their adopting the child, because undoubtedly they would become so attached to it that they would not be able to give it up. Some months later the brother told me regretfully he could then understand my former advice, upon which he failed to act. The child had become so much a part of their lives that they could not think of parting with it, and now he was doubtful if the father would consent to its adoption.

In another instance the young mother of a illegitimate child consented that a woman take her child so that she might hide her mistake. The woman cared for the baby for almost a year and grew to love it as her own. Then the child's mother asked that it be returned, and when refused, took the matter up in court. Had the woman who took the child secured the proper written consent of the mother in the beginning, she would have been saved much worry and expense.

It would seem a mistake, therefore, to delay in securing the necessary written consent to the adoption, or to put off the adoption proceedings once they have been decided upon.

While it is probable that the laws of no two states are the same in regard to adoption, there are nevertheless certain similarities in many of them. Some of the most common provisions are:

Persons adopting a child must be ten or, in some cases, fifteen years older than the child;

A husband or wife, who are living together, cannot adopt a child without the consent of the other;

The consent of the natural parents must be obtained unless they are insane, imprisoned, have abandoned the child, or are dead;

An illegitimate child may be adopted with the consent of its mother only;

The child itself must consent if over a certain age, which varies from ten to fourteen years;

The name of the child may be changed to that of the adoptive parents.

As a rule, all of the parties interested must appear before the court, although in some states it is simply necessary to record the prescribed papers. Also, in some states, adults may be adopted as well as minors.

The laws of the different states differ greatly regarding the matter of inheritance. Nearly all, however, provide that the adopted child shall inherit the property of the adoptive parents. This does not mean that such parents may not will away their property from the adopted child, because they may even cut off their own offspring in this way if they choose. But if they die without a will there will be no distinction made between the right of the natural or adopted child to inherit their property. Nor does it follow that because the child will inherit the property of his adoptive father or mother that he would inherit from their brothers or sisters or other relatives.

There is another phase of the question of inheritance which is of great importance and interest. It is as to whether a child after adoption will still be entitled to inherit the property of his natural parents. This would depend on the law in force where the adoption took place. If the statute provided that the child would or would not so inherit from its natural parents this would settle the question. For instance, in Connecticut the law expressly states that the adopted child shall not inherit the property of its natural parents or their relatives. In Massachusetts, on the other hand, the statute provides that a person shall not by adoption lose the right to inherit from its natural parents or kindred. However, such express provisions are rare, and the courts, in at least a number of states, have held that the child will continue to have the right of inheritance from his natural parents unless the statute has taken it away from him. In the eyes of the law the question of supreme importance in adoption matters is the welfare of the child.

Among Those Present—By LILLIAN TAYLOR

"East, West, Hame's Best," says this oldest "schoolgirl." To prove it, she is here seen leaving Southern California, to attend the summer session at the University of Wisconsin.

"A FAIR Co-ed, Age Ninety"; "Oldest U. W. Co-ed Visits Madison"; "Still a Schoolgirl at Ninety." Who hasn't read these (and similar) captions describing America's premiere student, Mrs. A. D. Winship? And who, outside of the friends of this gentle little woman, has not seasoned these statements with the proverbial grain of salt? For it is still somewhat the fashion to discredit the idea that octogenarians can enjoy the same things that interest younger folk.

Mrs. Winship can—and does!

This much-heralded "school girl" possesses an enthusiasm for life that approximates a passion. The lure of the "Road," both literally and figuratively speaking, fascinates her. It follows, therefore, that she "hits the trail" every year; travels from California, Texas, Florida or other southern points, to attend the summer session at the University of Wisconsin. Arriving in Madison, she quietly settles herself in the Latin Quarter, enrolls for work, stands in line at the cafeterias, and otherwise enters into the ordinary student life. Remarkable, you say? But it is remarkable only when she does not come back—she has missed but one summer (1918) in the last ten years—and she travels unattended.

Old age a barrier to study?

When I looked into the beautiful blue eyes—not faded, *old* eyes, if you please, but eyes as clear as a June-day sky!—again this year, I was suddenly convinced that this oldest co-ed will never be old. Why? Because the flame of her spirit is unquenchable! Amy Davis Winship has kept the lamp of her mind trimmed and burning, and the accumulation of years is the very least of her worries. Or rather, worry has no place in her philosophy of life.

That she established a precedent when she started to school at the age of seventy-nine, Mrs. Winship modestly concedes; but it was not to set in motion an octogenarian renaissance that she began her research. Her opportunity for study had not arrived before that time, she tells you simply; when it did come, she merely took advantage of it. And this common-sense explanation of so unusual a procedure is characteristic of the woman. She believes that keeping interested in something and eliminating worry are two of the very essential ingredients in her recipe for longevity. Having thoroughly tested out the recipe herself, she confidently recommends it to others.

"All my life I've wanted to study," she explains, her wonderful eyes flashing the fire which keeps her so alive, "to get down to the very bottom of things; so, I have gone into biology and botany; chemistry and economics; physics and philosophy; psychology and—goodness knows what all! Everything and everybody interest me. If textbooks can help me to understand humanity, well and good. But I do not confine myself to them."

As an example of her interest in the welfare of others, Mrs. Winship devoted six years of a very busy life to a class of young boys in her home town, of Racine, Wisconsin. Six evenings in each week during this period, she met with these boys, directing their reading, games, and the like.

Mrs. Winship's latest achievement is the writing of her autobiography. That the task was accomplished without the aid of a single note or record of any kind (she never kept even a diary, she told me), is further evidence that age has not impaired her faculties. Think of having a memory like that!

When I asked, with the freedom of an old friend, who made her dainty clothes, quick as a flash came the reply, "Why, I do, myself—and help my daughter make hers, besides!"

And there you are!

Head up, blue eyes forward, an example of one who has fully conquered the bugaboo of Age, and its twin-sister, Worry—page Amy Davis Winship, the Intrepid!

His Clean-Up Record Made Him Governor

ARTHUR M. HYDE

A GROUP of members of the commercial club of the little city of Princeton, Missouri, were discussing civic conditions. The town was "wide open." A clean-up was being agitated. There had been considerable debate about the practicability of such a move. The president of the club about 30 years old, insisted, heatedly, it would not be difficult. He was so positive about it he was challenged to undertake the task. The result was the club president became mayor.

When the new mayor took office the clean-up began. An incident is illustrative of the method. Evidence was collected against one of the town gamblers. He was tried, convicted and fined $700. There was an exodus that relieved the community of its undesirable characters. The clean-up was complete as it was lasting.

Possibly that mayorality campaign convinced Arthur M. Hyde, now of Trenton, and governor of Missouri by more than 100,000 votes over his Democratic opponent, that the clean-up platform was a good one upon which to appeal to the voters for a higher office. When he announced his candidacy for the Republican nomination last spring it was on a clean-up platform. He declared for prohibition enforcement, which was presumed at that time to be unpopular in Missouri, particularly in the larger cities; he attacked men who, he declared, were the bosses in his own party, charged the Democrats with having stolen previous elections and promised a change in methods.

At about the same time an anti-boss movement in the Republican party in Kansas City was begun. It was charged the Republican bosses had a working agreement with the Democratic bosses who controlled virtually every elective and appointive city and county office. Through that agreement, it was charged, the Republican party was made a "defeatist" party. Republicans elected generally voted with officials elected by the Democratic county machine on matters involving finance, favors and policy.

The anti-bosses won control of the Republican city convention. At the election its candidates, selected from the town's business and professional men, were counted out by two thousand votes in the heaviest city election vote in years. A contest now is pending in one of the courts. It was charged the boss election workers won the election by vote frauds, easy under Missouri's peculiar election laws and the complete control by the bosses of all election and court machinery, the police and county peace officers.

Boss Republican workers helped the operatives of the Democratic bosses, it was charged, in intimidating anti-boss election officials, slugging the anti-boss voters and participating generally in what was declared a reign of terror loosed late election day.

Shortly afterward Hyde began campaigning the state for the nomination for governor. He told of conditions in Kansas City, recounted how Republican after Republican candidate had gone to the boss-controlled wards north of the Kansas City belt line with majorities, only to be defeated. He charged elections were stolen and defied those he named to deny it. He urged Republicans to purge their party of bosses and go before the people with clean hands at the fall election. There were other developments. The Lowden fund exposures were among them. And in the primary Hyde was nominated.

Then came the campiagn for election. Hyde appealed to all voters, regardless of party, to vote for a clean-up. He continued his charges of stolen elections, thuggery and intimidation.

Hyde is an orator. His speeches made friends. Election day made him the second Republican governor in Missouri since Civil War days. The Republicans also elected, for the first time, the majority of the members in both legislative houses. Previously, even under a Republican administration, the Democrats had controlled, much of the patronage by the Senate being Democratic. It refused to confirm the governor's appointees to replace Democrats.

Perhaps the statement of O. B. Barton, of Trenton, Hyde's neighbor, who says he is a "nasty" Democrat, may explain the attitude of the Missouri Democrats who, tired of boss rule in their own party, took the opportunity to rebuke it, and voted for the national Republican candidates also. Barton said:

"I am going to vote for Hyde for four reasons.

"He has the disposition to do right.

"He has the intelligence to know what is right.

"He has the nerve to start anything he desires.

"He has the ability to finish anything he starts."

That was not, however, the first state campaign in which Hyde participated. He led the Roosevelt forces in the third Missouri district in 1912, which campaign ended in the now famous "ball-bat" convention. Ball-bats were used by some of the delegates in settling differences. He refused a place on the Republican ticket in 1916 but spent two months campaigning for the candidate for governor.

From a family of lawyers, Hyde formerly practiced in Missouri courts but gave it up, almost entirely, to take a large block of territory for a motor car concern, and investments.

A visitor to the Hyde home at Trenton brought back this message:

"Hyde's dog runs to meet him when the governor goes home. An eight-year-old daughter believes Hyde is a grown-up partner and Mrs. Hyde, after 16 years of married life, still is in love with him."

At the Hyde home the doorstep is worn, the grass on the lawn has been killed in many places by tramping, and the dining table is a big one, indicative of many guests. On a glassed-in porch is a roll top desk "for storing" the governor explained. Little Miss Caroline Cullers Hyde, however, rolled up the top. Inside was paper cut into fantastic shapes. "That," she explained with all the dignity of her pride in the governor, "is where daddy and I make our paper dolls."

Mrs. Hyde does her own housework. She is pretty, 37 years old, gracious and says no one else can make pies to suit the governor, so she gave up trying to keep help.

He Stuck to His Last

PREACHING the gospel of work has become so bromidic these days that it is refreshing to come across a man who does not preach but lives his creed.

Samuel N. Pelton, a harness maker of Pomona, California, now in his ninety-first year, has never lost a working day from his bench since he learned his trade more than seventy years ago and although but lacking a few years of the century mark he is still going strong. Only a few days ago he completed and sold a set of invisible stitch double work harness that in finished craftsmanship was a credit to the master workman that he is.

Mr. Pelton was born in Ohio in 1830. During his lifetime he has seen his country engaged in four great wars, not to speak of the Indian uprisings. He was a boy in his teens during the Mexican War and was a young man in his prime when the Civil War began.

Turned down twice by army doctors when he tried to enlist, Mr. Pelton has had the ironic satisfaction of outliving the grandchildren of the men who said he was too frail to make a soldier.

SAMUEL N. PELTON

Thirty years ago Mr. Pelton came to Southern California to grow up with the country. Although then in his sixtieth year he has witnessed the wonderful transformation of the cactus and sage-covered desert into one of the garden spots of the world.

He has also seen the rise and decline of a craft. The fancy buggy harness that once was the pride of the expert harness-maker is nearly a thing of the past. Even the art of saddlery is being lost. The gasoline steed has taken the place of the equine and even on the farm the tractor is narrowing the demand for work harness.

Mr. Pelton, himself, is no back number. Far from it. He keeps right abreast of the times. Magazines and the movies are his greatest sources of recreation and there are few meetings of the Odd Fellows, of which he is the oldest member in the state, that he does not attend.

Mr. Pelton does not have to work. He is in comfortable circumstances. His son-in-law, Mayor Vandegriff, of Pomona, is one of the substantial men of the community.

But in work Mr. Pelton has found contentment and contentment is the secret of health and happiness. Mr. Pelton is meticulously neat about his shop and person. He is as spry as a man of forty and his eyesight is keener than the average youth of twenty. He is no faddist. He eats what he likes and drinks what he likes and as much as he likes. He has never been sick a day in his life.

BRIEFLY TOLD

An everbearing Valencia orange tree, which is destined to revolutionize the orange industry, has been discovered by horticulturists in a grove at Tampa. The tree is about fifteen years old and has been bearing continuously eight years and apparently authentic records indicate that at no time during that period has it failed to have fruit and blossoms at all stages of maturity. Everbearing Florida lemons have been common for many years.

During the coal strike the change in the atmosphere of London has been noticeable. The air is clear and coal dust has ceased to settle in an ugly gray on clothing. Medical men have joined with architects in demanding that there be legislative repression of the uses of soft coal.

Beauty enduring for eight thousand years on the face of a girl is a remarkable feature of a mummy that has been brought to London from Egypt and is now in the Egyptology section of the University College.

Passengers for the United States, who miss the boat trains running between Paris and Havre, are to be taken to Havre by airplane. The planes will leave Le Bourget two hours after the boat trains have departed.

For nearly a mile along the Etobicoke Creek near Brampton, Ontario, thousands of dead fish and dead frogs floated on the surface of the stream when a high wind blew a hydro wire into the creek. Practically the entire frog colony was electrocuted.

Millions of army worms or caterpillars in New Brunswick have stripped the trees of foliage in many places. The railroad tracks are covered with these worms on certain sections and they grease the rails so badly that freight trains are having difficulty getting over the road and passenger trains are run in two sections.

A forty-foot vein of lead has been discovered in the heart of Dubuque, Iowa, one hundred sixty feet below the city.

An army airman flew across the Grand Canyon several times recently and also flew down into the gorge. He has been detailed by the War Department to study the air currents in and over the canyon and to locate possible landing fields there. This is believed to be a preliminary to establishing a commercial airplane service in that vicinity.

Texas is capable of marketing annually four million tons of wax from a weed known as the candelilla plant. It grows on the poorest kind of soil and a yield of ten tons an acre is frequently obtained. There are only six factories in Texas manufacturing the wax at this time.

The first jury trial ever held in the Mackenzie territory will be conducted at Fort Providence upon the arrival of the judge and the legal party who recently left Edmonton for the North. It will be the trial of a man for the murder of his wife and infant child.

According to a report to the infant welfare society in Chicago, the children of wealthy parents are not on a par physically with those of poor parents. In one school in an exclusive neighborhood half of the children examined were not up to normal weight and many were seven per cent. under weight.

In a barren and waterless waste in British East Africa is what appears to be a lake covered with a coating of snow partly thawed and then frozen again. It is in reality a deposit of soda. Travelers traversing this district in the dry season find their shoes burned and the sharp spikes of the soda will pierce any but the thickest soles. During the rainy season the lake is a beautiful pink.

A man ninety-seven years of age, living near Augusta, Maine, is cutting teeth for the third time in his life. Healthy, white teeth are working up through the gums with four teeth in sight.

To show their contempt for burglar insurance, burglars in New York City recently tore into bits the policy of the man they were robbing and scattered the pieces around the rooms.

A boy sixteen years old, while swimming in the Niagara River above Niagara Falls, was swept out into the current and over the falls. He saved himself by clinging to a drifting log which was whirled around in the outer eddy of the big whirlpool. Boy companions threw him the end of a rope and hauled him ashore uninjured.

Of the forty-eight states constituting the United States, forty have adopted the Mothers' Pension law in some form.

Street cars of Glasgow stop only at stipulated stations. At other places the motorman merely reduces the speed of the vehicle, the passenger making his ascent to the platform on the fly. This practice saves considerable current in the course of a year.

In Japan there are five Japanese for every acre cultivated.

For the first time in history a woman presided over the House of Representatives when Miss Alice Robertson, Republican member from Oklahoma, occupied the chair during the absence from Washington of Speaker Gillett.

Of every eight persons in the United States one is foreign born, according to recent figures issued by the Census Bureau.

An amphibious gun mount tractor has been invented which can travel under water to a depth of twelve feet by means of a periscope attached to the carburetor so it can get air. It can make ten miles an hour under water.

A Brooklyn judge refused to admit as evidence in a burglar's case a bag containing dynamite, fuse and blasting caps which were brought into court. When the prosecutor directed an expert to fit the caps to the fuse the judge suggested that the test be made before the grand jury.

The Navy Department has asked for sealed bids on a piano from the President's yacht, Mayflower. So many offers have been made for the old instrument by hunters of historical curios that this procedure was necessary to give everybody a chance. A new concert grand is replacing the old one.

In 1920 almost six million barrels of Chinese flour were shipped to Europe. New mills are to be built in the wheat-growing sections.

Afflicted with paralytic nerve shock due to an automobile accident and without the use of his right arm, a Chicago man has trained his left hand to handle a brush and has turned to painting. His paintings bring a good price in the market.

When the South Platte River was a raging torrent recently with all bridges washed away, a woman lay dying for lack of medical attention two miles from a physician on the opposite side of the river. When all hope seemed gone the doctor remembered that the Postmaster General had "humanized" his department. He secured a mail airplane and made the trip, receiving the authority afterward.

Details of a new continent in the Antarctic region describe a country rich in oils, minerals and furs. The British Antarctic expedition has found strange birds of immense size as well as many other oddities in the new country.

The United States Weather Bureau station on the north coast of Alaska frequently reports a summer temperature of one hundred in the shade.

A woodpecker recently held up an important Southern Pacific train near El Paso when it pecked away the lead wire to the track relay post near the signal. This threw a red "block" causing the engineer to stop the train to investigate.

A man in Waukegan, Wisconsin, claims to have discovered a bug that kills potato bugs and that he is raising a colony of the killers in his basement.

Senator Arthur Capper has loaned out two hundred thousand dollars, without security, to boys to purchase pure-blood pigs. The boys become interested in their stock raising and remain on the farm. The Senator is applying the same idea to chicken clubs with girl members and has already loaned fifty thousand to Kansas girls for purchase and development of purebred flocks.

The Australian Commonwealth Government has offered a reward of 25,000 pounds for oil in payable quantities and the New South Wales Government has offered 10,000 pounds for oil. Despite the fact that in many sections of the country oil is actually trickling from the earth at the rate of two or three gallons a week, government engineers have been unable to find oil in commercial quantities.

Utah's anti-cigaret law bars all smoking in public places in addition to prohibiting the giving away, sale, exchange or barter of cigarets.

Of famous cities we the founders know;
But rivers, old as seas to which they go,
Are nature's bounty: 'tis of more renown
To make a river than to build a town.

—WALLER

A BRIDGE AND STREAM IN THE CATSKILLS.

When Fire Comes to a Forest

The tallest lookout tower in the National Forests. It is in the Sitgreaves Forest, Arizona. It is 117 feet high and was built by forest rangers.

By HARVEY W. PATTON

IN THE vast national forests of the West and Southwest, like the forests in other sections of the country, fire is the biggest problem confronting the government. Early discovery of an incipient blaze is of the utmost importance, for disastrous fires are often prevented when sighted quickly. For this reason the government maintains forest lookouts, whose duties are to watch for fires from sunrise to sunset.

The lookouts are stationed in towers at the highest points in the forests to enable them to obtain an unobstructed view of the territory in which they are located. But they do not depend on the naked eye to sight a fire. They have an instrument known as a protractor, a metal disc, which has sights and 360 degrees, or lines. The lookouts constantly scan the forest from the stations, and when smoke or a blaze is discovered through the protractor, its approximate location is immediately known. At that moment the protractor may have been focused on the 260-line, and that means the fire was on that line. The lookout immediately telephones to the office of the forest supervisor.

The supervisor has a chart on the wall of his office containing all the lines, or degrees, on the protractor. All he has to do is to refer to the chart and the fire is pretty closely located. Meanwhile, however, several other lookouts have discovered the blaze and also telephone in, giving the line on which they sighted it. The supervisor then compares all the reports with his chart, and the location of the fire is narrowed down to a few hundred yards, though it may have been 40 or 50 miles distant from the first lookout station reporting it, or the same distance from the others reporting it, for that matter.

From the foregoing it will be seen that a lookout's job is an important one, in addition to the lonely life he spends.

Notwithstanding this, girls and young women are seeking positions as lookouts in the forest service. These applications are the result of magazine publicity a young woman lookout in a Colorado forest received.

"How romantic to be a forest lookout," ejaculated many girls. And they forthwith sat themselves down and wrote applications for such jobs. The idea not only appealed to them as being romantic, but they figured the position would afford them an ideal vacation for the three best months of the year; also $90 a month.

One young woman wrote from far-off Constantinople, Turkey, applying for a lookout's berth in one of the Arizona forests. She said she would be ready to begin her duties in June. Other applications came in from girls residing in cities from the Atlantic to the Pacific, but not one of them has yet landed a job, and it is doubtful if any will.

Now let us analyze the reason for these applications. The girl lookout in Colorado has a keen sense of the value of publicity—they say she has been in the movies—and she really has a picturesque station, on the side of a cliff. She doesn't have to climb a lofty tower to reach her post, and when a picture of the young woman and her station, in its beautiful scenic setting, appeared in a popular woman's magazine, lots of other girls envied her and began making efforts to land the same kind of a job.

But the government has different ideas on lookouts. Forest Service officials, the men right on the job in the West, say women cannot fill the bill. Therefore they are discouraging them from attempting to land such berths.

In the first place, the fair maidens who are seeking the jobs know nothing about the country in which they seek to serve. And knowing the country is a prime requisite. For this reason the Forest Service selects men—men who are strong of body and keen of sight—men who know the country. A lookout's job in any of the big forests of New Mexico and Arizona is not a sinecure.

The men have to climb lofty towers, the ladders leading to the station being almost perpendicular; sometimes a towering pine tree is utilized as an improvised lookout point, and a man has to shin up that. And often, too, the lookouts actually have to fight fires, provided they are discovered close to the stations.

It is true that some women in New Mexico and Arizona have been successful forest lookouts, but they knew the country in which they served, because their homes were either in the forests or adjacent thereto. Other women have successfully served as substitutes for their husband lookouts.

A notable example of a successful woman lookout is Mrs. D. B. Whiteside, of the Mt. Taylor region in the Manzano Mountains of New Mexico. Mrs. Whiteside not only proved a valuable lookout, but she fought fires. She knew the region in which she served, because her home was on a ranch close by. She still resides there, but is not in the service now.

Of course, forest rangers are always on the lookout for fires, as are forest guards and other employes of the service, but a great responsibility rests on the lookout high up on his perch, and he realizes his responsibility and ever is on the alert. His hours are long, and he is exposed to the blistering rays of the sun as long as it shines. He perhaps won't see a human being for a month at a time. His supplies are packed in to him every thirty days, and he has to do his own cooking and housework. He may hear a voice, when he has occasion to telephone, but that is his only human contact for monthly stretches.

As for telephones, the Forest Service has built lines in all the forests for quick communication in the event of fire. The rangers and others in the service carry little telephones that they can connect up with the lines and talk from wherever they are.

"How do you fight forest fires?" a tenderfoot asked a forest ranger, who had paused to greet a group of hikers along the trail a mile out from the big camp grounds on the forks of the stream below his station.

By the side of the trail at this point was a large steel box bolted securely to a huge pine tree. The box had a legend painted on it reading: "United States Forest Service—Fire Tool Cache—In Case of Fire Break The Seals."

This box had prompted the tenderfoot's question.

Turning his horse into some tall grass, the ranger invited the hikers to sit down on a fallen tree.

"First of all," said the ranger, "the problem of fighting forest fires is quite simple. What do you folks do each night when you start camp fire down at the forks? Gather pine needles, those juicy, pitchy pine cones, dry wood, grass, and touch a match. Up it goes, just like oil. You don't put on green stuff, you don't pick wet pieces of wood out of the creek.

"Now, if all that stuff which is so plentiful in the woods serves to make a fire, what do you suppose we do when it gets burning in the woods and destroying things and generally raising Cain? Just this, we try to remove such stuff that fire feeds on. We discourage a forest fire by taking away the food on which it lives.

A Forest Service lookout "spotting" a fire in the Sitgreaves National Forest, Arizona, by means of a protractor.

"It is simple in principle, but not always easy in practice. As for instance, when a big wind comes up and some careless camper, down along the river, goes away and leaves his camp fire burning and an ember blows into the pine needles near-by and the spark becomes a little flame and the little flame a roaring sea of fire sweeping up through those beautiful trees all around the forks camping grounds; and the fire goes so fast it outruns a man on horseback, licks up all the tents and homes down there and in one jump goes up the slope of Baldy half a mile at a flash.

"Your camp is safe, but it might happen. Always remember that many a vacation that promised to be happy has ended like that.

"As I was saying, the problem of removing the fuel before the path of the forest fire varies with conditions. Dry seasons, a high wind, the steepness of the slope; they are the factors.

A lookout up a tree in the Coconino Forest in Arizona. This is an improvised lookout station and is another argument against women lookouts.

"You are well acquainted with the city fire department and its work; well, they put out fires by smothering them with water. No water is available for this method in the woods, so, as I said, we take the stuff away from in front of a fire and it naturally stops when there is nothing to feed on.

"With no wind and under normal conditions, by taking a rake and clearing a trail a foot wide through the pine needles on this flat we could keep a fire from spreading and in a short time put it out. Now, if the fire were to get into the log we are sitting on, it would smolder for days, perhaps, after we had corralled the fire on the flat and the needles and twigs on the ground were totally out. That log would be a danger point as long as a spark remained, for a wind coming up might carry a spark over our little fire line and if we were not here to put it out at once, we would have to fight our fire over.

"So in the case of burning logs, we smother the fire by shoveling on dirt, and shortly, the air being cut off, the fire goes out. If that standing dead tree over there were to catch up along its trunk, it would be sawed down either after the fire on the ground had been entirely surrounded or while it was still uncontrolled, if necessary, to keep it from throwing sparks across the line. In brief, that is the way forest fires are fought; a trail is cleared ahead of them to remove fuel and when fire burns up to the cleared area, it normally stops. When a fire is moving fast, it is often necessary to get a long distance ahead of it—some times several miles—to enable a line sufficiently wide to be cut and cleared. Sometimes dynamite is used to fell dead standing trees, remove logs and thus clear a wide path. Patrol of the line after the fire is stopped may be necessary for days to see that sparks are not swept across to unburned country.

"You can readily see the reason for that box and its tools. Rakes for the needles and small stuff; hoe and mattocks to cut sod and grass and to remove inflammable clods; shovels to smother logs with dirt; axes and saws to clear brush and fell dead snags that would act as huge torches to throw sparks far ahead of the fire line. Then we keep canteens and water buckets to supply the fire fighters with water; also lanterns for night work and sometimes a cooking outfit and rations for a small crew for several days.

"Of these fire tool boxes, we have six in this district, all so located as to be available in danger areas or along lines of travel where they can be reached going to a fire and thus save carrying tools a long distance, which, if you try it on horseback, you will find a slow job.

"Up at the station we have a rack of fire tools in the storehouse. That is the emergency equipment for a large crew in case of a big fire. Also we have there pack saddle racks with six pack outfits completely ready even down to spare shoes for the horses, cooking outfits, food in panniers or pack bags and also tents and a supply of blankets packed for a rapid getaway. Our fire department, you see," smiled the ranger, "and just as with the city department, we want to get to a fire quickly, only our getting there is not as spectacular as in the city.

"Now, the men who fight the fires, those who wield all those rakes and hoes, come from all sides of my district, which covers about 150,000 acres of these mountains. During the season, I have a 'smoke chaser,' who stays at the station awaiting fire calls. He goes at once to the reported fire; his horse always in the corral and an emergency fire equipment of a combination rake and hoe on his saddle and a light axe in his gun scabbard. He also carries a compact ration for two days. Bed he does not bother with, but he does take a small emergency telephone which he can tie on our system whenever he cares to. This man gets many fires before they do any damage. If too much for him to handle, I follow up with the packer and an outfit for a number of men and summon helpers from near-by ranches or pick them up on the way.

"All this is not quite as heroic or spectacular as your fire department down in the city, is it?" concluded the ranger.

How We Help Out the Men Who Rob Us

Some Foolish Things That We Do and Some Ways We Might Adopt

By JAMES C. MURNANE

Chief of the Bureau of Identification, St. Paul Police Department.

HUGE sums in money and jewels are stolen every year. Every newspaper carries reports of robberies of some kind. But few people realize that many of these losses might have been avoided.

Yet that is true. Men are always doing foolish things with their money or valuables, and so are the women. Sometimes they are just careless. More often they don't stop to think how easy they are making it for the burglar, or the pickpocket. Often they actually invite men to rob them. Of course, they don't intend to do it, but they do.

Now, take the pickpocket. Every year he reaps a rich harvest, much because persons don't keep their wits about them.

Incidentally, right now is the great open season for the pickpocket. Perhaps you never thought of it, but picking pockets is a summer occupation. It's too hard to find a man's pocketbook when he's bundled up in an overcoat, while in his summer clothes, it's easy. Pickpockets go South in winter, and come back with the warm days. They always get back by the Fourth of July—you see, that's one of their big harvest days.

So it may not be amiss to consider the methods of the pickpocket, and some practical means of foiling him. If men took only reasonable precautions, if they were only as observant as the professional criminal for instance, a lot of good pickpockets and burglars would be hunting other jobs.

Now, a pickpocket is an artist in his way. I have seen them so good that they could flip your money out of your pocket just in walking past you. A man digs down into an inside pocket to get money to buy a ticket. I have seen men who could brush past him and flip his roll out of his pocket while he's getting ready to button up his vest or his coat.

Here is a story that is characteristic, for instance. A bunch of pickpockets got on a train at Denver. There were nine men in the crowd. "We won't buy any ducats, but we will try to short the caducer," one of the gang said. They call the conductor the "caducer."

So they boarded the train without any tickets and paid their fares in cash. After they were out of Denver a little way, one man in the gang, Eddie Harvey, picked the conductor's pocket, and got all the money back.

Contrary to the popular belief, pickpockets work in groups, or "mobs." Usually in a mob, there are two or three "stalls," and one "tool." It is the job of the "stall" to distract your attention. Maybe he just knocks back your hat a little, apparently by accident, as the street car lurches a little. That is enough, just a moment while your attention is distracted the trick is done. The "tool" is the man who actually takes the money from your pocket. Usually, he passes the money to another member of the gang, known as the carrier, who makes the get-away, as they call it.

Now, here is a peculiar thing. Almost never do the victims pick out the right man when they find out they have been robbed. Men do the funniest kind of things when they get their pockets picked anyway. Sometimes they will turn around and grab the first man they see. Nine times out of ten, it is the wrong man. Lots of men will yell until you can hear them for a block. That, by the way, is the worst thing that a man could do, for it creates confusion, which is just the thing the pickpockets want to get away. And here is something else worth noting. If a fellow finds a good-looking woman thrown against him in a crowded street car as the car lurches, he's not going to resent it. It would be different if a man bumped against him. During the momentary distraction, a clever pickpocket can slip out his pocketbook unnoticed. There are lots of women pickpockets, and they are among the cleverest in the business.

Women rarely are caught picking pockets, either. You know how it is—you suddenly miss your pocketbook and look around and see a good-looking woman. Would you accuse her? Not on your life!

It is extremely hard to catch a "tool" in the act of picking a pocket, for it is done very quickly and usually there is a member of the gang standing on each side to obscure the view. Only the trained observer will notice a group of pickpockets working in a crowd. An amusing incident happened some years ago while a group of detectives were watching a crowd for pickpockets. Suddenly, one of the detectives came over to me very excitedly and said, "It's gone, my pocketbook—I've been robbed."

Men are always showing their money needlessly in public places, and they are always giving the prospective pickpocket assistance when they do it. If I were to lay down rules to avoid the pickpocket, one of them would be: "Never change a large bill at a ticket window, or other public place." Every man who shows a substantial sum of money invites robbery. A man may reach down into an inside pocket to get his money. The pickpocket notes the location of the wallet, and notices whether it seems well filled. Ninety per cent of the touch is accomplished right there.

There are six pockets in which a man carries money, and there is only one which may be called proof against pickpockets. Not very many men would think of it, but the only comparatively safe pocket is the little fob pocket down under the belt of the trousers. If you roll up your bills and stick them in this pocket, the only way a pickpocket can get them is to steal your trousers. That pocket lies so close to the body that no pickpocket with his senses about him would try to pick it.

Beware of the man who thrusts a newspaper under your chin in a crowded car—he may be using it as a screen, as in this picture posed by the detectives. Actually, an accomplice would be standing on either side to obscure the view shown in the picture of the watch being taken.

All the other pockets are easy for the expert pickpocket. If a man has a long, deep pocket, as for instance those at the side of the trousers the pickpocket "reefs" it, as he calls it. That is one of the most delicate operations in the business. The pickpocket slips two fingers into the pocket. He takes hold of the lining of the pocket on the side away from the body, and pulls the lining out gently, a little at a time, until he can reach the pocketbook.

Another rule to avoid pickpockets, I'd put into these words—"Never mingle with a crowd." Pickpockets always do their work in crowds, for then if a man is jostled, he will not notice it. Often, they create some source of excitement just to draw a crowd. I have known them to hire a tramp to fall over on the sidewalk apparently dead, for instance, and then they would explore the pockets.

Men are foolish for carrying around large sums of money anyway. Drafts are cheap, and they may be mailed to yourself, if you happen to be going on a journey. If you have to carry a large sum on your person, keep your hand on it every minute. Hundreds of cases of large sums being lost in this way are reported to the police of the big cities every year, and here is a significant thing, too—not all the cases are reported. In fact, scores of men get robbed who don't admit it because of the chagrin. That's human nature. There is another thing that it is well for men to know, and that is that the ordinary safety attached to a watch or scarf pin doesn't bother the pickpockets very much. Never wear a valuable scarf pin or watch unless the safety catch is sewed into the lining of the vest pocket or the reverse side of the tie. Any man who wears a valuable pin is regarded as an easy mark by the professional pickpocket. The safety catch on one end may keep the pin from falling out, but it doesn't bother the pickpocket. I have had old hands at the game tell me that they had worked for months, loosening the safety with the thumb and third finger, while they took the stone with the first two fingers.

JAMES C. MURNANE,
Chief of the Bureau of Identification, St. Paul Police Department, and a veteran detective, who points out some ways in which we actually help men rob us. He is one of the best-known Bertillon experts in the country.

It is the same with the safety on the watch. The pickpocket simply slips his fingers into the pocket and unfastens the safety. The easiest mark of all though is the man who wears his watch on a fob. That is an especial temptation to every pickpocket. All you have to do is to pull up. "Easy pulls," they call them in the trade.

Usually when a man has his pocket picked, he will cast his suspicions upon the poorly dressed man, if such a man happens to be standing near him. But that's another case in which invariably he is wrong. All clever pickpockets are well dressed, and many of them appear to be "refined and dignified." So, beware of the well-dressed man who sits or stands uncomfortably close to you. Also, look out for the man who thrusts a newspaper between your eyes and your scarf pin or your pocketbook. He may be using the paper as a screen while he takes your valuables. That is a favorite trick of the pickpockets, and works to advantage in a crowded car.

The man who gets too deeply interested in his evening paper is one of the men most frequently robbed. Here is another thing to remember. The man who sits or stands so close to you, with one hand out of sight, may be honest, and again he may be "crossing his mitts" on you, as the pickpockets say. By the way, that is an instance of the art of picking pockets. The pickpocket may sit down beside his victim and cross his arms casually. Suppose his victim is on his right. Does the pickpocket move his right arm? Not in the least, for that might betray him. He keeps that arm perfectly still and does the work with the hidden left hand.

Another thing to watch out for, is the man who steps on your toes, or breathes in your face. Pickpockets resort to dozens of different ways to distract your attention from your pocketbook. Usually, if they are clever, you think nothing of the jostling, but as the natural bumping about of the crowd. However, if you resent it, many gangs of pickpockets carry a bully to stay behind and do the fighting. Usually you won't be bumped about very severely until the pocketbook is lifted, if indeed it becomes necessary to handle you a bit roughly at all.

A gang of pickpockets was working in a street car. One member of the "mob," edging up to the intended victim, stepped on his foot.

"Get off my foot," said the victim, suspecting nothing in his anger at being trampled upon.

"It's off," said the "tool."

The victim, of course, thought he referred to the foot, and said "It's about time."

Instead, the "tool" meant the remark as a signal to his confederates that he had extracted the pocketbook, and was ready to make the get-away.

That's the way the "mob" works. The different members are total strangers apparently, and do not speak to each other as a rule. But they have signals by which they co-ordinate their actions.

If men would take only a few reasonable precautions, and keep their wits about them—but then, most of them lock the stable after the horse is stolen.

This is the first of two stories by Chief Murnane. The other will appear in an early issue.

Holding on to Their Jobs

WERE we premature in our rejoicing, several decades ago, over the assumed victory won by the Civil Service Reform movement? The spoils system that had held sway since the days of "Old Hickory" was then assumed to have been cast down and the merit system enthroned forever in its stead.

Yet, even at this late day, we are confronted by the discouraging fact that the President and his Cabinet advisers are opposed in their efforts to give the country a business administration.

The war involved an unprecedented inflation of departmental employes at Washington. After the war the mass of unfinished business to be cleared up made impossible any immediately drastic reduction in the clerical force. Still it seems unnecessary that today, nearly three years after the cessation of hostilities, a force about double that of pre-war days should be on the public pay rolls.

We are carrying burdens imposed by the war and there is need of economy in public expenditures. Yet impartial observers agree that every department at Washington is so crowded with clerks and messengers that they fall over each other on the stairs and in the corridors. Public business is actually clogged by superfluous employes.

Much to his credit, President Harding set about the necessary reorganization very promptly. After about three months' careful investigation, the competent committee appointed by him for this task has reported a plan by which it is claimed that the government will be able to cut its expenses a million dollars a day—with decided gain in efficiency.

But the job-holders and their friends have organized an opposition to this salutary reform and they are being backed by politicians in either house of Congress and politicians "back home." The office-holders seem to regard the public service as a private snap existing for the sole end of providing them with bread tickets. The politicians seem to be more concerned with "keeping up their fences" than with serving the true interests of the nation.

The humane side of the question, of course, should not be overlooked. It might be only fair to give even to the incapables weeded out in the public interest a month's extra pay when they are fired, so that they shall have opportunity to find other jobs. But the entire situation is one that offers a glaring illustration of the perils of bureaucracy—of the sort of thing that proved the dry-rot sapping the strength of the Russian Empire and at last toppling it into the dust, as it is today the canker at the heart of republican France.

The issue, therefore, is not only that of saving a million dollars a day, important as is economy. Uncle Sam may be rich, but he is not rich enough nor strong enough to permit the ascendancy at Washington of a bureaucracy—the worst of all forms of government. And the issue is now up to the people of the United States. Let others make prompt demand on their representatives for the complete and genuine separation of the civil service from party politics. And such a demand might well be made articulate in requiring that President Harding shall be supported whole-heartedly in putting through the reorganization he has planned.

King and Cooper

WHEN a Britisher asserts that his country is more truly democratic than ours, an American is apt to meet the assertion with an incredulous smile. He admits that there may be a democratic spirit among the officers at a regimental mess, but he sees wide separation between the bearers of the King's commission and the ranks. Members of a common profession, lawyers, doctors, journalists, teachers, treat each other as equals; but they all look down upon common tradespeople, as these in turn look down on common working people.

It is difficult for an American to reconcile the pomp and state of royalty, or the great gap between lord and commoner, with democracy. But the average Englishman sees no contradiction nor inconsistencies in these things. He will, perhaps, tell you that we fail in this country rightly to relate the principle of democracy with that of degree. There must be gulfs if democracy is to bridge them.

The career of "Will" Crooks, and the circumstances marking its close, help us to understand the English point of view. Crooks, who has just died in his seventieth year, was a typical British workman. He was born and lived all his life in London's East End in the Borough of Poplar among simple and, for the most part, very poor people. In early life, he was apprenticed to the trade of coopering and always earned his living at that trade.

Crooks' unfailing horse sense, his entire devotion to the cause he embraced and his native intelligence, supplemented by close study and clear understanding of social problems, early made him conspicuous among the British labor leaders. So in 1892 he was chosen to represent his native borough in the London County Council, the governing body of the British Metropolis and perhaps the greatest municipal legislature in the world. In 1901, he was elected mayor of Poplar, an office now filled by George Lansbury, editor of the *Daily Herald* and internationally famous as a Christian and Guild-Socialist leader. Two years later, Will Crooks was chosen as Labor member of Parliament for Woolwich, a seat which he continued to hold unttil his death, meantime serving for eight years also as chairman of the Popular Board of Guardians. In 1916, he received the distinction of an appointment as member of the King's Privy Council, carrying with it the right to the prefix, "Right Honorable" and the affix, "P. C." He laughed at the reporters who interviewed him as to what difference this honor might make in his manner of living and told them he would keep right on helping Mrs. Crooks with the family washing and "doing the dishes," when he was not attending to his parliamentary duties.

Eloquent of the popularity of this robustly honest, plain-spoken and hardworking Labor legislator were the tributes called forth by his recent death. So great was the prestige which he enjoyed that even the bitterest of his political enemies sincerely respected him personally. King George addressed a letter of condolence to his widow, paying genuine homage to the old workingman and declaring that his death would be mourned by all classes of his fellow citizens, regardless of their differing political opinions. More than this, several of the London newspapers, among them the Conservative *Daily Express*, are urging that the mortal remains of Will Crooks shall find sepulture in Westminster Abbey—the Walhalla of Britain's kings and heroes.

Nelson's words before Trafalgar: "Victory and Westminster Abbey or defeat and oblivion!" tell what that means in the minds of the English.

Our Picked One Per Cent

THERE was one phrase in President Burton's altogether admirable and inspiring baccalaureate address to the graduating class of the University of Michigan the other day that suggests some serious thinking, quite aside from its application at the moment. He was dwelling on the qualities of intelligent judgment, cool-headedness in emergencies, trained thinking and right-heartedness that qualify men and women for leadership in their communities, and for which communities have a right to look to the college graduate—especially the graduate of a state university supported by the people. "Remember," he said, "that you are a picked one per cent of the population."

In all the present discussion of the great problem of education, we have not begun to attach the significance we should to the great outstanding fact that only one per cent of the children enrolled in the common schools of the land ever reach college. Probably less than ten per cent of this one per cent of the school population are enabled to pursue the post-graduate work which is the essential function of a university, in the best sense of the term. That is, only one-tenth of the Americans who mount the bottom rounds of the ladder of our educational system ever reach the top rounds, which, in turn, but serve as base and start for the efficient and full human life in an ideal system.

We submit that this single fact is a startling commentary on the failure to adapt our present system to the ideals and the needs of a democratic community. What is the remedy?

Horizons

DETROIT includes in its population one person with a unique distinction. She is the wife of our janitor. Her niche in my hall of fame was not won by distinguished service with mop or broom but by the fact that she has never ridden on a train. And she is proud of it.

The Kansas City newspapers had a lot of fun at the expense of two Boston school teachers who attended a convention of the National Education Association in that city and who expressed disappointment to a reception committee at not having seen any Indians anywhere on the way.

A Brooklyn social worker tells in her biography of a nine-year-old child in his neighborhood who had never seen a street car and cried out in fright when it saw for the first time "a big yellow house on wheels" coming toward it.

Some people view life as the small boy saw the ball game—through a knot-hole.

The domain of their interest is bounded on the north by their job; on the east by their immediate family; on the south by the evening newspaper; and on the west by the motion picture theater.

Mr. Edison tested the knowledge of college graduates and found that many of them were ignorant of the simple facts of everyday life.

When I was a boy, I used to go down to a small grain elevator and watch the blind horse which furnished the motive power for conveying the wheat. Round and round it went day after day oblivious of the delights of green pastures and the rollicking joys of romping with the herd.

This picture has always remained with me as symbolical of the man with a narrow range of appreciations.

The difference between the neighborhood gossip and the man with the "international mind" is one of horizons. Both are endowed with an equal amount of that undifferentiated mental energy which manifests itself as curiosity and interest and which is a source of pleasure when projected toward the outside world.

But the hobbled mind of the gossip ranges within very narrow limits. The mental energy must have an outlet but it displays itself only as interest in petty scandals, trivial affairs of neighbors, murder mysteries in the papers and such public events as are highly personalized.

Travel will not necessarily widen such an outlook. The man who cannot see wonders in his home town, who cannot discover hidden meanings in the events of his daily round, or see the romance of everyday life, will not find them on a foreign shore.

You can't bring home souvenirs from abroad unless your suitcase has room to hold them.

One woman whom I know who has traveled a great deal can talk for hours about London, Paris, Munich and Naples. But her conversation is all about hotels—the Savoy served such delicious lamb-chops; the waiter at the Ritz had a funny way of blinking his eyes; the Kaiserhof's elevators were so slow you could do much better by walking up the stairs. This is her Europe.

"They return home with traveled bodies but untraveled minds," is the way Colton describes such people.

The world is a dreary and monotonous place to the man with the one-track mind; it displays a thousand splendors to him but he has his grimy working cap pulled so low over his eyes that he sees nothing but the concrete sidewalk which extends from his shop to his dinner table.

Cultivate the "open mind, the observing eye, the sympathetic heart." Expand your range of interests to include the big world beyond the three-mile limit of your present knowledge—push back your horizon toward the edge of the earth.

Remembering the Living

IN OUR concentration upon the pious and patriotic thought of honoring the memory of the men who have fallen in defense of the nation and all it stands for, there may be some danger of our forgetting the living. This possibility seems to have been foreseen and happily met by an organization of women called the Daughters of Columbia which had its beginnings in California a short time ago, but which promises to become national in scope.

A San Francisco reader, Mrs. John Parker, secretary of the new organization, writes us that the attempt by local women this year to institute in a modest way an annual "Memory Day" in recognition of living ex-service men met with great success.

The day chosen was May 29, probably with the idea of making the celebration a fitting prelude to the observance of Memorial Day, and so properly linking national gratitude to the living with that shown to our dead defenders.

Mr. Ford's Page

AS A general principle, the complaint against taxes is not well taken. By this is meant, of course, taxes in general. In theory, taxation is the contribution of the beneficiaries of our institutions toward paying the cost of the benefits. Dwellers in a city have water service, and fire protection, and police oversight, and public lighting, and various other community benefits, and they each pay their quota toward maintaining them. In theory, our governments are co-operative undertakings.

When we estimate what we get in return for our ordinary taxes, it is not a bad bargain at all.

Still, taxes have always had a bad name. People have always complained about them. And these are facts not to be disregarded. When people persist in disliking and speaking ill of a practice, there must be some reason for it. Anyway, it is a clue worth following.

It may be that taxation is the wrong way to provide for the support of governments: it may be that governments ought to be so organized as to pay for themselves. It may be that taxation is the right way, but that the method of laying the tax is wrong; it may be that the tax is laid in the wrong proportion, or on the wrong values, or on the wrong people; it may indeed be that certain values ought not to be taxed at all.

As it is with us, we tax initiative and progress. There is one whole school of thought which declares that we penalize ambition and success. The man who refuses to improve his property is allowed a low tax; the man who improves his property and puts a home on it, is charged a heavy tax. If a house is left unpainted and unadorned through the shiftlessness of its owner, it is taxed lightly; if a man takes pride in his premises and keeps his house painted and trimmed, he is charged more taxes for it. There is a great host of people who are ready to say that this is not the right method of taxation.

These are questions which have been with us a long time, but there has been little actual progress toward improvement. There has been talk of economy of administration, tax reform and the like, but the sole result has been an increase in the different kinds of ways we are taxed, without an appreciable increase in the benefits which the tax monies are supposed to buy.

But when taxes are mentioned nowadays, the reference is usually to the extraordinary taxes which still remain from war times. War is nothing but taxation to the limit. The people pay and pay and pay, and their children after them, to the fourth generation. They pay their own tax and they pay as many taxes as can be piled on to the commodities they purchase. Taxes are paid—the government sees to that—but not always by the persons who turn in the payment; they collect it all down the line.

There are two points of view from which to study this matter of taxation: one is that of the taxpayer, the other is that of the government. In times of emergency it is the government point of view that prevails, and perhaps always will prevail more or less.

From the government point of view, therefore, a good tax is a tax that yields sufficient revenue, and a bad tax is one that does not.

If that is accepted as a rule—and circumstances usually force such acceptance—it is not difficult to see that many of the present special taxes are bad taxes, because they kill the very source from which they hope to draw.

There is, as Emerson says, a higher law that steps in to regulate such matters when man overreaches himself. *"Though no checks to new evils appear, the checks exist, and will appear. If the government is cruel, the governor's life is not safe. If you tax too high, the revenue will yield nothing. If you make the criminal code sanguinary, juries will not convict."*

Those natural checks have already begun to appear in the United States. "If you tax too high, the revenue will yield nothing" should be engraved on the walls of Congress as a prophecy which has been fulfilled. The revenue of the country, from taxation, continues to decrease.

The reasons for this are numerous. Some will say that it is due to the industrial depression, to the fact that many people are not working and consequently are not buying as heavily as before. And why are they not working? Because there is so little ready cash for industrial use. And why is there so little cash for industrial use? Because industries have been called upon to bear so disproportionate a part of the tax burden that investing capitalists have begun to put their money where it will be free from the tax law.

There are in this country a number of avenues for investment of capital on which no tax need be paid—municipal and state bonds, for example. The label "non-taxable" draws a great deal of timid capital. And, of course, this kind of investment in its turn increases the burden of the taxes and at the same time reduces the amount of taxable wealth. It is a scheme by which government, for its own ends, makes special arrangements with money-lenders.

The fact that investment capital thus seeks the lower rate and the longer loan term in order to escape taxation would indicate that there is more profit in doing nothing much than in doing something industrially progressive—and that is the sign of bad taxation practice.

There is no evil without some resulting good, of course, and perhaps it should not be overlooked that, industrially, the country has learned a lesson about borrowed capital that it never learned before. There was too much borrowing, too much of the habit of getting money to continue a losing program instead of adjusting the program until it produced its own money. American industry is going to find its salvation on the drawing board and not at the bank.

But even so, the taxation that makes it unprofitable for men to work is essentially a bad taxation—for the country. It will readily be granted that it permits a pretty clean-up for certain financial groups. No one will deny that it enables some financial institutions to get a grip which they should never have on industrial institutions. It all works into the plan to place the financier above the practical producer, but it is not beneficial to the country.

Monetary institutions are excellent things in their place, but their place is not on the throne. Imagine running a railroad or a factory from a banker's office! A banker has his own place and his own excellent service to render to society, but that place and service is not to be a directing hand over everything in sight. In the first place, he can't do it; it is not his business. In the second place, he never gets the chance to do it except where the business has been so mismanaged that he has to step in on the plea of protecting the loans or investments.

The burden of taxation is no longer a mere phrase in this country. It is a real burden. And it is a burden wrongly placed. The man who does his utmost to keep the wheels turning and to maintain men in their jobs (which is the basis of national prosperity), that man pays; but the man who doesn't care, who closes down and waits for better times to come, living well in the meantime off his war-time profits, that man does not pay.

Whatever penalizes recovery in industry is bad. Whatever assists and rewards it is good.

Americans have been pretty successful as mechanics and as organizers of vast enterprises; but as inventors of tax systems, as administrators of government business in a way to render a stimulus what is now a burden and discouragement, we have much to learn.

When America solves the tax question she will have brought another degree of liberty to the world.

"IF THE tax is too high, the revenue will yield nothing," says Emerson. Though we may not have learned the secret of government support, whether by taxation or otherwise, in the very nature of things we are made aware when we are on the wrong road. The decrease in revenues under the present tax system indicates that we are on the wrong road. When the tax-producing forces become overburdened and discouraged by the tax that is laid on them, it is merely a repetition of the stupidity of killing the goose that lays the golden egg. It must be admitted that taxation is not the only thing that is wrong with the business life of the country; there has been an unwise manipulation of the monetary agencies also. But the hint of over-taxation and under-returns no government can disregard.

Beautiful Sylvan Lake with Turtle Rock in the middle distance and Mother Nature's "bags of wheat" beyond.

Land of the Turquoise Sky

By CARL SCHURZ LOWDEN

WHAT exquisite bit of rhymed nature study would the poet Byron have penned from a mountain top on the border between South Dakota and Wyoming? He saw and described "cloudless climes and starry skies." He saw the sky that hovers over Venice. He saw many of the earth's wonders; but he never looked upon the scenic gem of the central Northwest, nor the richest hundred miles square in the world, nor the vivid turquoise sky that is the canopy of the Black Hills.

Many of us are Lord Byrons. No, that is too complimentary. Lord Byron never came to America, and he consequently did not have the opportunity to see the Black Hills. What do we do? We go to Europe to see Switzerland and the Alps, and we forget our own. Familiarity does breed contempt. If the Black Hills were in France, they would be a Mecca for American tourists in the Old World.

The man that named them "Black" is no friend of mine; for the hills deserve a name fully as beautiful as they are. Black is gloomy; it connotes mourning and black magic, and that connotes the devil. Blue or red would be better. Of course, the Norway pines are responsible. If they were not so plentiful and so deeply blue-green as to give the effect of near-blackness at a distance, the hills might have had a better name and more glory today. Perhaps the turquoise sky has something to do with it all. Perhaps the peculiar sheen of blue-green accentuates the darkness of the pine-clad elevations. Well, I can't change the sky and I would not even if I could; but to me the Black Hills will ever be an example of unfortunate christening, and I shall ever think of them as the Bonny Hills or something like that.

What the Black Hills Hold

IF YOU have not seen the Black Hills, you have not seen your own United States. Certain features of them can be seen elsewhere at one place or another. The Black Hills are a nest of scenic variations, the variety show of the world. The highest peak is only seven thousand feet. There are no Niagaras in the section. But it contains probably the largest gold mine in the world, certainly the largest of those handling low-grade ore. It bosoms exquisite lakes. There are hot springs, trout streams, and caverns larger than Mammoth Cave. The dry, piney air invigorates. The magnificent sky appeals to one's sense of beauty, as do the trees that clothe the hills from head to foot.

In the Black Hills minerals and gems are common. You dislodge a stone as you walk, and where the stone was you find long hexagonal crystals of red, black, or white, or it may be banded. The substance is tourmaline. Farther on you glimpse gold shining from an outcropping. You have visions of a claim and millions. Alas and alack, you either make the discovery and save your equanimity, or you ask somebody and keenly feel your disgrace when he informs you that the scientific name is "iron pyrites" but that everybody knows it as "fool's gold." You then realize that you are a nobody. But you cheer up and walk on and see another shining substance. It proves to be mica. If you are fortunate in finding a big flat piece, you can split it up, cut it into postal size, and write home to the folks. The mica I found was all too small, but I begged some of the proper size from another fellow and scratched on it my homeward message.

You never know what's going to happen next in the Black Hills. My host, a mine owner, took me down the shafts and through the mine workings. He took along a gunny bag and a hammer, and me. It was a murderous outfit, and I scarcely knew whether I would get back alive. He chipped off bits of rock here and there. Upon our return we went to his own assaying room. He had selected rich ore; for some hours later he presented me with a button-like bit of gold almost as heavy as a five-dollar piece. Maybe I wasn't a surprised and happy lad with the glittering souvenir.

Little Streams Yield Big Trout

LEAF-BEDDED, fern-fringed, gurgling streams are frequently encountered. Brooks that one can hop across contain trout. There is never any need for anybody going hungry. Cut a limb from a birch or aspen, affix a bit of wrapping cord, bend a pin as a substitute for a hook, make your own fly, and go after the trout lurking in the shadows. Do not feel that little streams never yield worthy trout. They do in the Black Hills.

The fishing season for trout extends from the first day of April to the first of November. For bass, pike, pickerel and shad, the season is open the year round with the exception of April. The big hatchery of the government at Spearfish annually releases many thousands of fingerlings to replenish the streams; so there is not much danger of a famine in fish.

The hills are a paradise for the hunter. Of winged game there are partridge, pheasants, plover, ducks and geese. November is the month for the Nimrod after deer. In the least settled parts, those that are still rugged and primitive and scarcely touched by man's hand, one can introduce himself to bears, wolves, coyotes, and wildcats. The big game is steadily increasing in number, this being due to the rigid enforcement of the regulations. The government has no time for game hogs.

The man or woman that loves still, sapphire-blue lakes and boating in the moonlight and music wafted softly over the cool surface of the water, can find surcease from woe and a perfect heart's content on the placid lakes of this wonderland. Boating is exquisite in the daytime with the turquoise blue of the sky reflected where the paddles dip; idyllic it is at night with the stars twinkling from their cloudless dome.

The tourist should not miss Sylvan Lake, a well-named spot indeed. It is a rare gem. I never saw anything entirely matching it. The big white hotel and boathouse squats in a corner. The old turtle, "Turtle Rock," basks in the sunshine about three-fourths of the way across the jeweled water cup. All around Mother Nature has put on a fancy shore line. The columnar rocks, so white and upright, look like sacks of wheat that Mother Nature intended for some grist mill, only here she must have consideed herself overburdened and set them down and then forgot them. A children's story could be fashioned around these peculiar formations. If the lake were not so charming, it would be more easily described. No words—nothing—can paint its marvelous magic or enthralling beauty. It is one of those choice spots that must be seen to be understood, and boated upon before one can know its power of giving rest.

The Sylvan Lake region is rich in interest. The lake itself sits on top of a mountain located midway between Custer and Hill City. To the northeast Harney Peak attains an elevation of 7,240 feet. It is the giant of the Black Hills. Two peaks, Summit and St. Elmo, and Sheep Mountain cluster around the lake but none of them come within a thousand feet of Harney's head. Near the lake are many needle-like rocks, some apertures that might be called Mother Nature's windows, narrow passages between walls of towering granite and a tumbling river with its rock-strewn canyon. Below the timber line are the fragrant pines and some spruce; above the line the mountains prove their age by showing how bald they are.

The Devil's Tower near Sundance, Wyoming, is the most picturesque of all the mountains in the range. The government has, because of its oddity, set it apart as a national monument. It is a mile around at the base and several hundred feet high. It has the appearance of a huge tent made by leaning limestone poles around a circular form. Many years ago an unknown man and woman climbed to its top, though the ascent seems impossible. Uncle Sam (so it is said) plans to build a stairway from the bottom to the top so that the knowledge of the splendor of the view may not be reserved only to the daring man and woman.

Freaks in Range at North

THE mountain freak is at the north end of the range. At the south end is another freak of a different type. In 1881 a cowboy was galloping along when his hat was blown off with a gust of wind. He replaced it, but the same fate awaited him. Then he looked about him and discovered that the air current shot forth from the entrance or opening of a cave. Subsequently it was named Wind Cave and made a national monument. It contains a thousand rooms. A hundred miles of passages have been explored. The phenomenon has eight separate tiers or stories. The fact that it both exhales and inhales through the entrance makes it strangely human; and scientists have never been able to offer an adequate explanation; though they think it may have been a geyser long ago.

Still farther south lies Cascade Springs on an old stage road. There are seven of these mineral springs of which the largest, Big Geyser, carries on at the rate of sixty barrels of water each minute. The streams all converge and then flow on into the Cheyenne River.

A hundred thermal springs are grouped in and about the health-giving city of Hot Springs. Persons that have tried the waters of Europe come to this wonderful spot to renew their youth. The citizens aver that the mineral medicine of the water together with the magic of the ideal climate will make a sick man well and a well man "weller." The patients are required to take six glasses of water each day, also plentiful exercise between the glasses. If one is cynically inclined, he may point out that the exercise alone is beneficial; yet both the state and the nation have homes for soldiers there. The springs are of the same temperature as the human body. They flow to the astonishing extent of a million gallons daily.

Though the city of Custer is fringed about by forest preserves, it possesses a White House. This particular White House, however, serves mankind as a

hotel and lunchroom. The army of General George A. Custer discovered gold while encamped on the spot that later became the site of the town. This event made the town, and the presence of General Custer resulted in the use of his name. Then the commander led his men north after the forces of Sitting Bull who cunningly contrived the historic massacre. In the meantime, August, 1875, a plat of the budding city was drawn on birch bark, not because it seemed to be the best material but because none of the settlers had any paper. In those early frontier days the common necessities of life were often unobtainable.

Gold was next taken out of Deadwood Gulch. Within a few days the building of the town began. It took its name from the gulch, a tangle of nearly impassable underbrush and dense growth of pine thickly marked with dead timber. Here adventurers rushed from all the states, Canada, and even Mexico. Men drank, gambled, played fast and loose, with the right hand ever ready for a quick draw and both eyes ever watchful for the smallest sign of danger and turbulent conflicts. To wine, women and song, wealth was added often; perhaps more often, total loss at cards including the grub stake. No man's life was safe. Within a few months after the wild scramble began a Mr. Wheeler and two partners had taken $140,000 out of Mother Nature's bulging pocket.

The Gold City of the West

"PLACERS yielded fabulously," the oldest newspaper in the Black Hills averred. "Quartz brilliant with gold passed from hand to hand. Speculation in town lots amounted to a furor of the wildest kind. Everybody wanted to buy real estate. All did who could. Building was at its height, taxing to the utmost Boughton & Berry's sawmill which ran day and night. Workers were in great demand. He who could saw a board or drive a nail could command his own price."

All that is gone now. Deadwood is a civilized town surrounded by rich mines. The gulch and the old stage road remain. No more do agents lie in wait for the rumbling, careening, outgoing stage with its treasure of gold dust. One cannot stand on the corner of a busy street, however, without visualizing those old days of primitive instincts and emotions when the word of the mightiest man was the only law.

Three miles to the southwest and 550 feet higher than its sister city is Lead, the gold queen of the Hills. The tourist will find here the great Homesake mine, the greatest producer from low-grade ore in America if not in the world. More than three thousand men are employed, and some of them work a half mile beneath the surface. Hundreds of heavy stamps pound the ore incessantly in the process of separating the precious metal from its rocky tomb. Gigantic engines and mammoth machinery operate the mine. Visitors are cordially received but never permitted to descend into the shafts or tunnels that man, the mole, has laboriously carved in the mountain.

One Breathes Deeply Here

THE trip from Deadwood through the Spearfish Canyon to the city of the same name will never be forgotten if once made. In thirty-one lineal miles the railroad makes 375 curves while the pitch averages a hundred feet to the mile. The lift from Deadwood through Englewood to Portland exceeds a third of a mile. From Portland on to Spearfish, only twenty-five miles, the drop is 2,778 feet. At one point the traveler can look out of the car window and see three sections of the track on which the train has spiraled upward. The danger cannot be accounted serious, however, as the train has the track for its own exclusive use. It leaves Deadwood every morning, arrives at Spearfish near noon, and gets back to the starting point in plenty of time for supper.

From the windows of the coaches the passengers can obtain glimpses of Wyoming to the west and of Montana to the north. The rays of the sun illumine the castellated mountains of barren rock, of red and yellow sandstone and gray granite, which form the sides of the colorful gorge. At its bottom the Spearfish River lashes and lunges onward, hastily making its mad descent at the rate of a hundred feet to the mile; its water is muddy red from the waste of the cyanide plants that separate the gold from the ore. The Spearfish Falls gleam in the distance like a ribbon of the finest silver, and above them lies their snow blanket. Lakes dot the Hills. Beyond, ever beyond, is the dark green or near-black of the spruce and the pines with an occasional relief provided by clumps of white birch. The air is dry and fragrant with the pungency peculiar to the evergreens. One breathes deeply without effort. One vaguely wonders how anybody could sicken or die amid such invigoration; for it seems that there, if nowhere else, man should live forever.

The Hills are not awesomely grand like the Alps or the Himalayas; but they embody much that the widely scattered show-places of the earth contain. With its gold and mineral wealth, its placid lakes and rushing rivers, its falls and hot springs, its canyons and peaks, its rock formations and caves, its brilliant sunshine and raiment of evergreens, its balmy atmosphere and the clearest moon—with all these, the Hills are the Alps and the Himalayas and the Rockies in miniature. And one cannot forget the turquoise blue dome of the sky overhead. As Byron might have written and as Omar Khayyam did write in his "Rubaiyat" about another subject, the scenic gem of the central Northwest is truly "paradise enow."

A freak formation, The Devil's Tower, near Sundance, Wyoming.

The Little Giant of British Labor

London, June—
(By Mail.)

J. R. CLYNES is just past fifty years of age. He began work as a half-timer in a mill in Oldham. Two years later he was a full-timer, doing a man's work.

No man before the British public at the present time has had such struggles to gain a foothold among his fellow men. Clynes left school at the age of twelve and about the only thing he remembered of his schooling is the canings he received from a priest. He hated school and everything and everybody connected with it.

His real education began when he heard of a local schoolmaster who had evening classes in his house. For the consideration of two pences an evening the schoolmaster undertook to teach him something—without the aid of a stick.

There is a good story told of Clynes—and it is well authenticated—that his first attempts at public speech were made under unique circumstances. He made the acquaintance of a young Irishman named, Byrne, who was a gifted street orator. The Irish boy undertook to initiate Clynes into the art of self-expression. They went to an abandoned stone quarry outside the town and practiced on each other until the Celt was assured that his pupil was ready for promotion. Hardly anybody beyond the small circle of their personal friends ever knew that the fierce debate in a public hall between Byrne and Clynes was a "frameup." Clynes wiped the floor—or the platform—with his friend the orator and Byrne was assured that his time had been well spent.

Mr. Clynes, when asked about the influence of books in his life, mentioned three. First, a cheap dictionary, which he copied page by page in order to acquire a vocabulary. The second was "The Seven Lamps," by Ruskin, and the third was a volume by Emerson. These he read while he was unable either to buy or borrow them. He read them at a second-hand book stall, under the pretext that he was looking for something to buy!

He ultimately bought "The Seven Lamps" for a shilling. "This price, low as it was," says Clynes, "upset my spending-money arrangements for three weeks."

At the age of 21, he began his work as Labor organizer for the Oldham district and for nearly a quarter of a century, was secretary of the Oldham Trades and Labor Council.

For some years he has been president of the National Federation of General Workers, with headquarters in London. He is a member of Parliament who is one hundred per cent proletarian and of the very warp and woof of the working class. When Lord Rhenda became food controller he chose Clynes as his Parliamentary secretary and when Rhenda resigned, the Prime Minister appointed Clynes to the position.

By this act a Lancashire cotton hand became the Right Honorable J. R. Clynes, a position he held with more distinction than any of his predecessors in that office, until the Labor movement broke their truce with the government and withdrew their members. Two other Labor members held their Cabinet positions and were repudiated by the Labor movement. Clynes worked in harness, did his job and held the respect of the British people, the British Government and the Labor movement.

Burns went out in pique. Henderson went out on a trivial misunderstanding. Roberts and Barnes broke with Labor and remained in the government.

During the war, the most illuminating comment on General Haig as a commander-in-chief was—no comment at all. There was nothing to say, either good or bad. The same thing might be said of Labor members of the Cabinet. There was nothing very good and nothing very bad. The old parliamentary hands of the Labor movement, the men of ability, were against the war and were therefore completely out of it, and when they offered themselves for re-election were shelved overwhelmingly. Those who were elevated to Cabinet rank showed no particular ability or adaptability for high office.

There is a suspicion abroad, even among the ultra respectables, that even while in high office they were unable to shake themselves loose from the all too obvious stamp of a servile tradition. Even Clynes referred to himself in the House of Commons once, as, "a common laborer." I am inclined to believe that this undue and wholly unnecessary meekness had much to do with the breaking of the truce between Labor and the government. As a Cabinet officer, Mr. Clynes, more than any of his Labor colleagues, displayed the qualities of statesmanship. He became the one outstanding success. He worked on equal terms with his chance colleagues of other political parties. He had courage, balance and vision.

In the Labor movement Clynes is the outstanding and pronounced opponent of direct action. As a consequence when addressing Labor meetings of a general character he meets more opposition than any other leader. Nevertheless, he has just been elected chairman of the Parliamentary Labor group in the House of Commons.

The mind of England is being prepared for a Labor government. When the day arrives, one of three men —Henderson, Thomas, Clynes—will be summoned to Buckingham Palace. In that case the little man from Oldham would easily outdistance all others in the race for the Premiership.

How Jewish International Finance Functions

The Warburg Family and Firm Divided the World Between Them and Did Amazing Things Which Non-Jews Could Not Do!

"Such has been the development of international bankers that they can no longer be regarded in their professional capacity as the nationals of any country, entitled to do business under their own government's supervision exclusively. They are really world citizens, with world-wide interests, and as such ought to be made amenable to some form of supernational control."—George Pattullo, in *Saturday Evening Post.*

NOT only did the Jewish financial firm of Kuhn, Loeb & Company use farsighted prudence in splitting its political support—one Warburg supporting Wilson, another Warburg supporting Taft and an unnamed member of the firm supporting Roosevelt, all at one time, as Paul M. Warburg testified—but it split its activities in several other ways also.

The international interests of the Jews comprising this firm are worthy of note. The influence which forced the United States to repudiate a commercial treaty with Russia while Russia was a friendly country (1911), and thus to compel all business between the United States and Russia to pass through German-Jewish hands, was generated by Jacob H. Schiff. Russia seems to have been the country on which he chose to focus his activities. The full story is told in THE DEARBORN INDEPENDENT of January 15, 1921, under the title, "Taft Once Tried to Resist the Jews—And Failed," and is reprinted in Volume II of the booklet containing this series.

Mr. Schiff's activity consisted in forcing the Congress of the United States to do a thing that was repugnant to the reason and conscience of President Taft, and which he personally refused to do or to recommend. Mr. Schiff left the White House in great anger with the threat, "This means war." It did not mean as much war as it might have, for President Taft acquiesced gracefully in the Jewish victory and has since been extremely laudatory of them on the public platform.

This Member Handled Russia

MR. SCHIFF'S firm also helped finance the Japanese war against Russia, and in return desired Japan as a Jewish ally. The wily Japs, however, saw the game and kept their relations with Mr. Schiff to purely business matters. Which fact is well worth bearing in mind when reading the widespread propaganda for war with Japan. If you will give particular attention, you will observe that the same interests which are just now engaged in most loudly "defending" the Jew, are most active in spreading anti-Japanese sentiments in this country.

The Japanese war with Russia, however, enabled Mr. Schiff to advance his plan to undermine the Russian Empire, as it has now been accomplished by Jewish Bolshevism. With funds provided by him, the basic principles of what is now known as Bolshevism were sown among the Russian prisoners of war in Japan, who were sent back as apostles of destruction. Then followed the horrible murder of Nicholas Romanoff, Czar of Russia, with his wife, his crippled son, and his young daughters, the full tale of which has now been told by the Jew who managed the crime.

For the part he played in destroying Russia, Mr. Schiff was wildly hailed in New York the night the news came that the Emperor had abdicated.

Meanwhile, the Jew who was "to take the Czar's job" (as the common New York ghetto phrase ran, weeks before the event) had left New York to be in waiting.

This Jew was passed out of the United States at the request of a very high American personage whose subservience to the Jews was one of the marvels of the past seven years. Halted by the British, this Jew was released from their toils at the request of a very high American personage. And thus, the Jewish Bolshevik Revolution in Russia, the program of which was made in America, was set in operation without a hitch.

Mr. Kahn Handles France and Britain

THIS whole firm is German Jewish, its members having originated in Germany. It had German connections. How far it maintained those connections through all subsequent events is a separate question.

Mr. Otto Kahn's allotted portion of the world seems to be Great Britain and France. Mr. Kahn is of German origin, like the rest of the firm, but he has not publicly shown such concern for Germany as have the other members. Mr. Schiff was once very active for the settlement of a peace on the basis of a victorious Germany. Mr. Paul M. Warburg also had interests, discussion of which is postponed for the present.

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

But Mr. Kahn succeeded, through the connivance of American authority and the excessive repression of the newspapers, in conveying the impression that by some species of occult separatism he was not "German-minded."

Therefore Mr. Kahn flits lightly everywhere—except Germany. He is sufficiently French to be able to tell in the first column on the first page of *Le Matin* on what terms America will do business with Europe, and he speaks as one having authority. He is sufficiently British to have thought of standing for the British Parliament, when an unfortunate event made it necessary for him to remain in the United States. Mr. Kahn sometimes flits farther East into the more Jewish portions of Europe, and his comings and goings are marked by certain changes with which his name remains most ostentatiously disconnected.

Mr. Kahn has very recently been telling France on what terms the United States will help her. There apparently being no other spokesman, Mr. Kahn's word is accepted as authority. France is one of the most Judaized countries in the world, the haunt of International Jewish Financiers who exercise their power (thus saving France the trouble of passing laws) to keep the emigrant Jew out of France; so that France presents the spectacle of being Judaized by Jewish finance and not by immigrant Semitic hordes, and is thus a fit platform from which Mr. Otto Hermann Kahn may utter his pronouncements.

In his last declaration to France, Mr. Kahn prepares her to expect little by stating that "America is a country of immense resources; but the actual money which the people have at their disposal is comparatively limited." True enough. It was a member of Mr. Kahn's firm who invented a monetary system which was promised to keep *money* in more equal relation to *wealth.*

But as he goes on telling what America will and will not do (the American people knowing nothing about it meanwhile) Mr. Kahn discovers with great enthusiasm a place where he thinks American capital can be placed, namely, *"in the development of the vast and immensely rich colonial empire of France."*

Playing Them All From One Center

AND pray where is that? Any Frenchman would tell you now, "In Syria." Syria—ah!—that part of the East where the natives are loudly complaining that the Jews are driving them out contrary to every written and moral law. The Jewish powers have already succeeded in getting French troops over there; bad blood has been caused between France and Great Britain; the Jews on both sides are playing for the middle; and here is Mr. Otto Kahn himself pledging American capital to the development of the French colonial empire! Talk to any Syrian who knows his country's present status, and he will interpret Mr. Kahn's words very vividly.

One of the nicest bits of work Mr. Kahn has done is to denounce "pro-German propaganda" which he says has exasperated Americans in favor of France. Next to committing the United States to an undying admiration for Briand, this is really his finest bit. Especially, with Partner Paul playing the German sympathy string! It is a great international orchestra, this Jewish financial firm; it can play The Star Spangled Banner, Die Wacht am Rhein, the Marsellaise, and God Save the King in one harmonious rendering, paying obsequious attention to the prejudices of each.

Next come the Warburgs. Their interest is, of course, in Germany. Paul stated in his testimony given at the beginning of the World War that he had interests in Hamburg and would dispose of them. The war came on. The Jewish government in the United States was augmented. Mr. Warburg was no mean figure, as previous articles have shown.

The Warburgs are three in number. Felix M. is the other one in America. He appears but sightly in public affairs although he is a member of the American Jewish Committee and of the firm of Kuhn, Loeb & Company. His retiring habit, however, does not argue lack of consequence. He was of sufficient consequence, Jewishly, to have bestowed upon him a sort of honorary rabbinical degree of "Haber" which entitles him to be known as "Haber Rabbi Baruch Ben Moshe." He is the only Jew in America upon whom the title has ever been conferred.

Max Warburg represents the family in its native land. Max Warburg had as much to do with the German war government as his family and financial colleagues in America had to do with the United States war government. As has been recounted in the press the world over, the brother from America and the brother from Germany both met at Paris as government representatives in determining the peace. There were so many Jews in the German delegation that it was known by the term "kosher," also as "the Warburg delegation," and there were so many Jews in the American delegation that the delegates from the minor countries of Europe looked upon the United States as a Jewish country which through unheard-of generosity had elected a non-Jew as its President.

Max Warburg is an interesting character also as regards the establishment of Bolshevism in Russia. The Jews had several objectives in the war, and one of them was "get Russia." To this end the German Jews worked very assiduously. Because Russia was a member of the Allies, the work of German Jews was made the easier. But the fact that Russia was an ally made no difference with the Jews who were resident in Allied countries. Win or lose, Russia must be destroyed. It is the testimony of history that it was not so much the German military prowess as the Jewish intrigue that accomplished the downfall of that empire.

In this work Max Warburg was a factor. His bank is noted in a dispatch published by the United States Government as being one whence funds were forwarded to Trotzky for use in destroying Russia. Always against Russia, not for German reasons, but for Jewish reasons, which in this particular instance coincided. Warburg and Trotzky—against Russia!

Comes Close to Bolshevism Again

POOR John Spargo, who ought to know better, denies all this—while every American who comes back from Russia, even those who went over there pro-Bolshevik, yes, and returned Jews themselves, proclaim it.

The crushing fact is that Bolshevism is not only Jewish in Russia, and in America, but it is Jewish in the higher regions of Jewry where better things ought to exist. Take Walter Rathenau, a German Jew on the plane of the Warburgs. Rathenau was the inventor of the Bolshevik system of centralization of industry, material and money. The Soviet Government asked Rathenau directly for the plans, and received them directly from him. Max Warburg's bank held the money; Walter Rathenau's mind held the plans—which makes it a pertinent question: If Bolshevism can be so Jewish outside of Russia, what hinders it being Jewish inside Russia?

It is a most significant fact that, as in Washington, the most constant and privileged visitors to the White House were Jews, so in Berlin the only private telephone wire to the Kaiser was owned by Walter Rathenau. Not even the Crown Prince could reach the Kaiser except through the ordinary telephone connections. It was the same in London. It was the same in Paris. It was the same in Petrograd—in Russia which so "persecuted" the race that controlled it then and controls it now.

All in the Schiff-Loeb-Warburg Family

NOW, this sketchy outline of the internationalism of the firm of Kuhn, Loeb & Company is not offered as the result of keen research, for the facts are found on the very surface of the matter, for anyone to see. What is revealed by research is this: whether Mr. Schiff's interest in Russia had underground features which affected the welfare of the nations; whether Mr. Kahn's flitting missions here and there, which he made with great freedom during the war, were wholly taken up with the business announced in the public notices; and whether Mr. Warburg, whose interest in Germany has not abated, to judge from his recent utterances, was able to retain complete neutrality of mind during the war. These are questions of value. Obviously, they are not easy to answer. But they can be answered.

It was a family enterprise, this international campaign. Jacob Schiff swore to destroy Russia. Paul M. Warburg was his brother-in-law; Felix Warburg was his son-in-law. Max Warburg, of Hamburg, banker

of the Bolsheviks, was thus brother-in-law to Jacob Schiff's wife and daughter.

Speaking of the farsighted manner in which the house of Kuhn, Loeb & Company disposes itself over world affairs, there is also the curious fact that in this Jewish firm is one who goes to a Christian church—a most heinous thing for a Jew to do. Split three ways in American politics and as many ways as international matters require, we find this firm split two ways with regard to religion. Mr. Kahn professes—at least he attends, a Christian church and is accounted an adherent of it. Yet he is not ostracised. His name is not taboo. The Jews do not curse him. He is not denounced as a renegade. The Jews have not buried him out of mind, as they do others who desert the faith.

This presents a strange situation when it is considered. Not to recount again the horror and reprehension and active antagonism with which Jews view such a desertion, suffice it to say that there is no greater marvel than that of Jacob H. Schiff retaining in the firm of Kuhn, Loeb & Company a "renegade" Jew. He could not have done it; every fiber of his intensely Jewish nature would have rebelled against it. Yet there it is!

Without going further into this ingenious system of covering all vital points from one center, enough has been said to show one busy Jewish financial firm with which political matters, national and international, is almost a profession. The family of Warburg high in the controlling group of two countries, and enemy countries at that. The family of Warburg high in the negotiations of world peace and the discussions of a League of Nations. The family of Warburg now advising the world from both sides of the earth, what to do next. It was probably with more reason than the general public surmised that a New York paper printed during the Peace Conference an article headed, "Watch the Warburgs!"

The fact seems to be that, as Mr. Pattullo is quoted as saying at the head of this article, the international financiers have been so engrossed in world money that the sense of national responsibility sometimes becomes blurred in their minds. They desire everything—war, negotiations and peace—to be conducted in such a way as to react favorably on the money market. For that is their market: money is what they buy and sell: and because money has no fixed price, it is a market which offers the widest opportunity for the trickster and swindler. One cannot play such tricks with stone or corn or metals, but with money as the commodity everything is possible.

Looking Forward to the Next War

MR. WARBURG is already very much interested about the treatment to be accorded foreign securities in the next war. Readers of the daily newspapers may recall that recently a demand was made for the gold in the Reichsbank, which was resisted on the ground that the Reichsbank, although the central bank of Germany, was really a private concern—just as Paul Warburg said it was and just as he has insisted that our own Federal Reserve System should be, and which it is. There is farsighted wisdom in that, with a view to possible defeat in war.

Mr. Warburg is apparently quite disapproving of the treatment accorded alien enemy property "by some countries." He quotes a French banker throughout—nationality not stated—and drives home his point. Th French banker used as an illustration a possible war between England and France (this was only last year) and said that the bankers in each country would proceed to withdraw their mutual balances and securities, for fear of confiscation, and that such a course would precipitate a panic.

To which Mr. Warburg adds: "I think that our bankers ought carefully to study this very serious question. We have nothing to gain and much to lose by joining in a policy of disregarding the rights of private property. We shall probably, in the course of time, become the largest owners of foreign securities and properties, which would become endangered in case we were drawn into war. To me, however, it is of greater interest that nothing be done that might stand in the way of making the United States the gold reserve country of the world. . . ."

Such talk passes with too little scrutiny. It bears a strong reflection of recent events which should not be overlooked. Moreover, it presents a grandiose vision which is supposed to command instant agreement because of its appeal to superficial national pride and selfish ambition.

If what Mr. Warburg says is an intimation that the International Jews are planning to move their money market to the United States, it is safe to say that the United States does not want it. We have the warning of history as to what this would mean. It has meant that in turn Spain, Venice, Great Britain or Germany received the blame and suspicion of the world for what the Jewish financiers have done. It is a most important consideration that most of the national animosities that exist today arose out of resentment against what the Jewish money power did under the camouflage of national names. "The British did this," "the Germans did this," when it was the International Jew who did it, the nations being but the marked spaces on his checker board.

Today, around the world the blaming word is heard, "The United States did this. If it were not for the United States the world would be in better shape. The Americans are a sordid, greedy, cruel people." Why? Because the Jewish money power is largely centered here and is making money out of both our immunity and Europe's distress, playing one against the other; and because so many of the so-called "American business men" abroad today are not Americans at all—they are Jews, and in many cases as misrepresentative of their own race as they are of the Americans.

The United States does not want the transfer of All-Judaan to this soil. We do not desire to stand as a gold god above the nations. We would serve the nations, and we would protect them, but we would do both in the basis of real values, not in the name or under the sign of gold.

On the one hand Mr. Warburg recites pitiful facts about Germany in order to raise sympathy for her, and on the other hand he stimulates the gold lust of the United States. The plight of Germany is entirely due to the forces from which the United States has only narrowly escaped; and to hearken to international Jewish plans for the rehabilitation of Germany is to be in danger of approving plans which will fasten Jewish domination more strongly on that unhappy country than it is now. Germany has paid dearly for her Jews. The Warburg voice that speaks for her would seem indeed to be the voice of Jacob, but the hand that proposes financial dealings is that of Esau.

Samples of Jewish Internationalism

THE internationalism of the Warburgs is no longer in doubt, and cannot be denied. Felix Warburg hung on to the Hamburg connection longer than did Paul, but the breakage of either was probably perfunctory. At the same time that Felix left the Hamburg firm of his brother Max, a Mr. Stern also left the Frankfort firm of Stern, and both became very active on the Allies side, taking sides against the German nation as lustily as anyone could. "Impossible!" say those who fancy that a German Jew is a German. Not at all impossible; the Jew's loyalty is to the Jewish nation; what the Jew himself refers to as his "cover nationality" may count or not as he himself elects.

This statement is always met with frothing wrath by the Jews' "gentile fronts" in the purchased pro Jewish press. But here is an example: Do you remember "The Beast of Berlin," that lurid piece of war propaganda? You did not, perhaps, know that its producer was a German Jew, Carl Laemmle. His German birth did not prevent him making money out of his film, and his film does not prevent him annually going back in state to his birthplace. This year he goes accompanied by Abe Stern, his treasurer; Lee Kohlmar, his director; and Harry Reichenbach—a list of names duplicable in any movie group.

Messrs. Stern and Warburg, of Frankfort and Hamburg, respectively, and away from home perhaps only temporarily, were not concerned about the fate of the "Huns," but they were immensely concerned about the fate of Jewish money power in Germany.

To indicate how blind the public has been to the inter-allied Jewish character of much of the world's important international financial activity, note this from the *Living Age* earlier in the year:

> "According to the *Svensk Handelstidning,* the recent American loan of $5,000,000 to Norway was really the outcome of an agreement between the Hamburg firm of Warburg & Company and the New York bankers, Kuhn and Loeb. It is regarded as a significant sign of the times that a German firm should be responsible for an American loan to a neutral country. The conditions subject to which this money was borrowed, are not regarded as very favorable to Norway, and no marked effect on the rate of exchange between the two countries has followed."

Note, in the light of all the statements made about Kuhn, Loeb & Company, and the Warburgs in particular, the assumption in the above quotation that the transaction was really between a German and an American firm. It was principally an arrangement between the Warburgs themselves in family counsel. But the loan will pass in Norway as *"an American loan,"* and the fact that the terms of the loan *"are not regarded as very favorable to Norway"* will react upon Scandinavian opinion of this country. It goes without saying that *"no marked effect on the rate of exchange between the two countries has followed,"* for that would not be the object of such a loan. The dislocation of exchange is not unprofitable.

It would be most interesting to know in how far Kuhn, Loeb & Company has endeavored to readjust the rate of exchange.

In Germany to Whisper Was "Verboten"

DURING the war, Kuhn, Loeb & Company made a loan to the city of Paris. Considerable German comment was occasioned by this—naturally. And it is very well worthy of record that in the city of Hamburg, where Max Warburg does business, the chief of police issued this order:

> "Further mention in the press of loans made by the firm of Kuhn, Loeb & Company to the city of Paris, and unfavorable comments thereon, are forbidden."

The following story is vouched for as reliable, and if in one or two minor details it does not represent the exact fact, it is a trustworthy illustration of how certain things were done:

> "A Jewish international banking corporation bought up the mining and other similar concessions of Jugo-Slavia, and consequently the policy pushed at the Peace Conference was that which was most convenient for that group. An understanding on the Fiume question was in progress between Wilson and Nitti. Certain concessions had been agreed upon and Wilson was willing to negotiate, when Oscar Straus and one of the Warburgs appeared on the scene. Wilson changed his attitude over night and afterward insisted on the Jugo-Slavia solution of the problem. The way in which concessions had been bought through that territory was a disgrace, and observers expected that it would play an important part at the Peace Conference."

The financiers are not the only International Jews in the world. The revolutionary Jews, of all countries and none, are international also. They have seized upon the idea of Christian internationalism, which means amity between nations, and have used it as a weapon with which to weaken nationality. They know as well as anyone that there can be no internationalism except on the basis of strong nationalism, but they count on "cover words" to advance their plan.

Enough transpired between the lower and higher Jewish groups of every large center during the war to render it imperative that Jewry confess, repent and repudiate the madness that has ruled it, or else boldly assert and espouse it before the world.

Certainly enough has transpired to render it desirable that the American people look again into the purposes of those Jews who were instrumental in reorganizing our financial system at a most critical time in the world's history.

Max Warburg was apparently strong enough to suppress German discussion of his brothers' activity in America. The Warburgs at present resident in America must suffer it, therefore, that American comment be made as full as need be.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents in stamps to cover printing and mailing cost.

JEWISH WORLD NOTES

Press dispatches signed "Jewish Telegraph Service" have ceased, probably temporarily. It was becoming rather difficult to blame all the disorder on the Arabs when non-Jewish sources of information were insisting that the trouble was due to the Red Bolshevik Jews who have entered Palestine from Russia. Another reason for the cessation of the reports may be the fact that the Jewish ruler of Jewish Palestine has been forced to make a rule curtailing Jewish immigration. It would be difficult to protest against anti-immigration laws in the United States when they have been found necessary even in Palestine.

"Every Jewish boy and girl is of princely descent, for every Jew is of royal lineage. We trace back our blood relationship to the most exalted ancestry in human history. There flows in our veins the living fire of Abraham, Joseph, Moses, David, Ezra, Nehemiah, Daniel, Isaiah, Judas Maccabeus, Bar Kochba, Maimonides, Einstein."—Address by Saul J. Cohen, to the Young Judeans.

One feature of the past month was the large number of articles about the Jews printed in the magazines. Give a newspaper or magazine writer half a chance and the truth comes out. Some of the fairest criticisms have been from the pens of Jewish writers.

There is a serious revolt in American Jewry against the "persecution" cry. Most Jews are growing tired of it. Moreover, there is an increasing Jewish willingness to admit that public statements made concerning the Jew in the United States are true, and that the proper answer is not a whine nor a curse but a sensible "about face" on some things.

Judge Mack, Rabbi Wise and other American Jews recently defeated by the Zionists at Cleveland are going to have a convention of their own at Pittsburgh.

It is reported that the dance craze has hit Jerusalem. Quite likely and quite logically.

It is rumored that the Jewish leaders are preparing to open up Jewish "defense" on a grand scale. Deep disgust has been expressed by the scandalously stupid "defense" efforts made up to date. Denial has failed. Confession requires more courage than has yet been aroused. The Jewish Question can only be settled by the Jew facing the facts about himself and ridding himself of that which brings him in collision with a very patient world. This will be the inevitable attitude if the rumored literary campaign is to have weight. Previous literary efforts are dead already.

As to That Watch Tower on Capitol Hill

By A. R. PINCI

WHAT do the American women want now? That's what members of Congress would like to know. But they would like to know it by the old-fashioned method, as man to woman or, to be exact, as woman to man, and not by the new-fangled political processes operating, legally, through constitutional amendment. The mere fact that women are labeling their wants by means of the vote, or the power of the vote, is creating consternation in the manly breasts of our legislators, not only in the District of Columbia, but in forty-eight state capitals, too.

So Congressmen are worried by the threatened militant activity of the new Woman's Party, which has decided to erect a "Watch Tower" on Capitol Hill, a few hundred yards from the two Houses. And to prove that they are in earnest, the suffragettes have bought more real estate, which is going some these days in Washington, D. C.

Of course, all is not peaceful and serene within the women's camp or camps, because it seems that there are many of them, distinguished by differing purposes. While the first pronunciamento is for a constitutional amendment which would make it compulsory for the President to appoint a woman to the Supreme Court of the United States—a sort of woman's bill of rights—the National Association Opposed to Woman Suffrage has called on President Harding to urge his opposition "to issues not related to the Nineteenth Amendment."

President Harding, some time last year, let it be known that he looked with favor upon the plan of including women in the foreign service of the United States, in the belief that they could be very useful in commercial activities abroad. But in contrast there stands the official action of the British Government, just announced (which proves that women elsewhere are on the jump), by which the Civil Service Commission reserves to men all posts in the diplomatic, consular and commercial service.

Want to Sit on Juries

THE Woman's Party is anxious for legislation which will establish the right of women to sit on juries in every state and Federal court, yet within one week in June one lawyer excused women from jury service in Cincinnati because "the record so far in criminal cases has shown that female jurors always are for conviction; women are merciless, much more so than men," while in Chicago the question came up whether or not women, despite enfranchisement, are the peers of men. Although the attorney for the Cook County jury commissioners did not deny woman's fitness to serve in the rôle of juror, he pointed out that for "1,000 years the laws of England and the United States have specified trials by twelve men—a rule as hide-bound as the code of the Medes and Persians." He denied that a woman is man's peer.

Along comes a noted New York woman who says that "suffrage simply makes things worse. There were too many politicians in this country before the women got the vote. The women are using suffrage to vent their jealousies and spite and to promote personal ambitions."

That all is not smooth sailing with the women may be proved, however, by the plan of the General Assembly of the Southern Presbyterian Church a few weeks ago, to bar women from all activity, including foreign missions, Christian Endeavor supervision, attendance at assemblies, and speaking in churches.

London meanwhile announces that five pounds sterling, about twenty dollars today, and no more, is to be the price of a wife in Liberia, according to a recently ratified convention between Great Britain and Liberia, but even at that price, not a bargain by any means, women's rights are to be recognized, for the convention expressly provides that no claim can be made in respect of a woman except by her husband, and that "no woman can be compelled to return to a claimant against her will."

There seems to be a cross-current of purposes, as between women and women, men and men, and women and men. Perhaps that's why the women of America are "out again" and on the warpath. Officials and politicians, especially those who cannot be one without being the other, had hoped that the Nineteenth Amendment would have satisfied the women, but the renewed promise of the suffragettes that their hats—and don't forget the hatpins—are once more in the ring has dismayed them. Worst of all, the lone Congresswoman in their midst speaketh not.

Eve Cast the First Vote!

IT IS difficult to account for the renewed uneasiness of public men. The novelty of woman in a man's world is now uninteresting. There is no use getting excited about what men are not going to do shortly before they make ready to do it. For a long time the men temporarily in power refused to give the women the vote—which refusal did not last long—and those strenuous objectors were probably the very men who wore scarlet underwear because the woman of the house said so, and they took paregoric because she believed in the remedy, and ate fried brains and made out he was pleased while his stomach ached for Frankfurters. Those were the men who yielded to some woman every moment of their lives—except in the hallowed precincts of Senate or House.

It is nettling for a man to admit that the joke is on the men. A "chicken" with her head on can make an official act like a chicken with his head off. Now there is nothing humorous about woman's activities in politics and government, in this country or in other countries, and whatever comicalities are obvious are rather contributed or made possible by man.

Eve cast the first vote recorded in behalf of her sex. An amateur scientist said it was not exactly a vote, but a spell which she cast, and which he termed "feminite," and which remains dormant unless it mixes the right proportions of "mannitis." But be that as it may, it is well known that there was some question as between Eve and Adam as to whether they should partake of the forbidden fruit, and it is equally well known, alas for man, that when the matter came to a vote Eve carried it. The "eyes" had it. She has carried it ever since. It does not help matters at all to say that the *tabernoemontana dichotoma*, good before they ate it, has been poisonous ever since, and that the indentation in the rind suggests the guilty toothmarks of she who voted not wisely but too well! All that is pertinent is that woman has outvoted man from the very beginning.

If man disregards woman's vote he is going to get in trouble. If there is an unbeliever it is only necessary to refer him to the eloquent admission of William Hohenzollern, when he was Emperor of Germany, who in a diary wrote as follows:

"I do not know what is the matter with me. For the first time in my life I find myself thinking constantly about a woman. It is the Countess Sophy von Goertz." A month afterward, April 6, 1902, the monarch, after having confessed his love, was amazed to hear her say: "Will you give up your plans of world conquest? Oh, if you do, all I have is yours and my love besides!"

This request angered Emperor William. He did not see her again until the following November, when she was dying. Again the Emperor told of his love.

"You would not sacrifice any of your plans and designs for my sake," she reproached.

And this is how the monarch himself analyzed the situation a few hours after her death:

"If ever I loved anybody, it was Sophy Goertz, but when she asked me to give up for her sake all the ambitions I had been imprudent enough to confide to her, I am glad that I did not hesitate and that I rather sacrificed her, and my love for her, than what I owed to my country and to my people. Germany must become the world-wide power it is destined to be, and it must become such during my reign, if only as a compensation for all that I have sacrificed for its sake."

Thus Emperor William was a conspicuous example among millions of man's unwillingness to abide by what Ruskin calls woman's power for sweet ordering and decision. It brought disaster to this world of ours. The countess had no way of "voting" in favor of her own judgment except by plain speech, which was the one thing monarchs have resented.

Thus we come to the subtle difference between the actual and potential vote of woman. Merely as a phase of politics and government it is one thing, and a very superficial thing; as a guiding influence in invisible ways in her own sphere it is another thing, all pervading and beautiful. Man, generally yielding to the latter influence, goes on the warpath as soon as it is translated into a vested legal right.

How the Women Win

EVERY mother's son, be he a Senator, an alderman, a deputy, a wai wu pu, a prefect, a chancellor, a mayor—will be quite susceptible to the wishes of the woman or women who are his relations or friends, and each word by these women is a feminine vote. He doesn't know it, but it is. Yet as soon as these selfsame ladies want to register perhaps the same views in a booth by means of an X-mark instead of at the breakfast table or while driving or on a sofa, then the men become stark crazy.

Of course there is a reason for this feeling. And on the men's part, it is a good reason. The women should be flattered by it. The hardiest champion of woman's rights must admit that man's opposition in the matter is not solely a question of selfishness. It traces its origin, rather, to the instinct of knighthood, sometimes crudely or grotesquely manifested, but none the less compelling.

For such opposition the women themselves are to blame. The first and most militant women's rights representatives were not very good for sore eyes to look upon. Who does not remember the masculine woman with the long stride, the tweed suit, the swinging arms, the big-booted feet, her pockets and stiff collar, her crush hat and seal ring? Their hearts were all right, but their appearances were against them. One or more of such women calling on a defenseless Congressman or governor made him wish for chromatopseudoblepsis, nyctalopia and all the other opias.

The fear which statesmen have of women is no product of the present times. Has any one forgotten Cardinal Mazarin's comment, as he was about to return to France after attending to a state matter, that there was no rest back home, because "female politicians" were more dreaded than the male? Doesn't it sound like a quotation from our own Congressional Record?

What the woman with the seal ring on her index finger and hand-sewed heels on her boots and mannish suit could not accomplish by means of prize-fighting methods, the sweet young things a generation later cajoled men into giving them. Uncle "Joe" Cannon knew. So do some others of the old-timers. One of them exactly sixteen years, seven months, and nineteen days before the time of writing, known as one of the leading fishing enthusiasts of Congress, referred to a certain suffrage representative as a whale. That same man has lived to see a different breed; something like the fighting fish of Siam, that when quiet are dull but when excited or after something their colors glow with metallic splendor. Perhaps that's why we have metallic dress goods.

Naturally a little thing like a constitutional amendment could not destroy the inherent antagonism between the sexes. While deluded males thought all was right with the world, they have received another jolt by seeing the Woman's Party refurbish itself and the country for another campaign. And the men who are holding jobs by virtue of the vote, or by grace of a power that has its origin in suffrage, are beginning to wonder what's coming next. The Watch Tower on Capitol Hill does not seem very reassuring to men whose tasks in the past were soporific. They know something's coming, and needless to say, with women implicated, they cannot guess what.

They are truly in a panic. It seems silly, too, that able-bodied monarchs of all they survey, when women are not around, should be stampeded by so innocuous beings as the more deadly of the species.

A few days ago in a conversation with a member of Congress the question of suffrage came up. He was one of the unyielding opponents all the while the question was before Congress—until he married. He married a few months before ratification. His bride "voted" him in favor of the Nineteenth Amendment. He himself admits it, though perhaps unaware of the marvelous potentialities of woman over mere man, sometimes. Yet he was bewailing the times. He wished he had been called into this world a couple of generations sooner. In the movies he had seen pictures of American homes, North and South, before the fifties, and he felt that the women of those days, with their lace gloves, their ten-inch sunshades, their domesticity, and the like, were not worrying the legislators of their day with "insane requests for this and that."

On the Vote for War

HE EVIDENTLY had overlooked, in his feeling, the exact measure of influence exerted over the men by their women in those days, of which the literature of the times is rich in examples. It seems to many that the principles which led to the Civil War beset the women more than the men. It is undoubtedly true that the women of the South, a trifle more reserved, more feminine, and more unassuming, in comparison to their hardier northern sisters, became the dominant figures that led to war, and every chronicle of the times bears out this fact. If that was not an indirect but withal a vote for war—what was it?

It has been my privilege, for twenty years, to meet men whose names have figured very prominently, and some still do, in the world's news. In many cases I have known their women. Every one of them, as far as information of this nature can be traced, has been an admirer of the women of his immediate circle. It was these women, after all, who made them. Excepting those men whose tradition or religion actually ostracized woman, not one of them has truly carried out uninfluenced masculine ideas and plans, whether for better or for worse. Behind their work there has been a woman or the dream of one.

In the case of one of the most inaccessible diplomatists—and I am speaking of days before the war, when public men had no reason to be nice to members of the press—it was by mere chance that I stumbled upon the secret of what put me in possession of much valuable information, and it had to do with some innocent bit of gossip.

"Ah!" laughed he, replacing his monocle which mirth had displaced, "my wife will enjoy that."

Thus I knew that he was one statesman subject to a superstatesman—or is it superstateswoman—and thenceforth I never went back unless I carried with me an excellent bit of gossip.

There is no way of eliminating this interdependence between the sexes. Nero was one who tried it, when he feared the ascendancy of his mother in state matters, and proceeded to do away with her, with disastrous results to himself.

Thus no matter at what point in history we may start, it is quite impossible to single out any outstanding event in which woman's influence does not figure. To repeat, this influence is a vote—and it is the vote. It is the original suffrage method provided by nature, as tough as the bone from which sprang the voter, and of which Adam was the first victim.

It was a lesson for the women; ever since then they have been trying to vote him back into Paradise, or as near to it as they could achieve, and they are still at it.

Absurd to Get Excited

SO IT does seem on the whole absurd for men to get excited about what women want in the way of votes. The last election did not prove much about women's votes.

Getting down to corner stones, what woman in this country wanted above all was the right to vote. She wanted it because! Now if legislators can explain that because they can perform miracles. They can eliminate taxes.

Women know very well, if the men don't, that the Nineteenth Amendment is merely a safeguard. They are not going to the polls to get anything in particular out of the men, although it may be needed to get something out of other women, and then the fun will begin. As long as woman's ancient method of voting, by suggestion or innuendo, works satisfactorily, she won't bother much about that X-mark (not to be read as a ten-spot) but if he is hard-headed, and things don't go just right, and the country be in danger, then the vote—the formal vote—will come handy.

Much is going to be said about equality and division of responsibility and liability, but just as long as man continues to uncover his head before a woman, that equality cannot be established. That uncovering is a good sign that he considers her a superior being and it gives her a good chance to look into his mind. Buying a watch tower, or whatever it is to be called, to prod the sluggish ones, is persiflage and publicity.

GARFIELD A. WOOD,
Vice Commodore of the Motor Boat Club of America

Miss America in Action

How "Watching Everything" Won Fame and Fortune

ONE time a certain successful man was asked for the secret of his success. His reply: "Quite simple. Even when a boy I made it my business to watch everything that went on about me and to find out all I could about everything I did not know."

Now, if a certain young man had not paused on a side street of St. Paul one day, back in 1912, to watch three laborers unload a truck, America would not stage the international speed boat championship races this year.

You will probably say that it is a long jump from watching three laborers unload a truck in 1912 to holding a world's race event in 1921. It is. If the jump did not exist this story could not be written, for the story will attempt to explain the connection.

It is not so much the story of a speed boat race and the lifting of the championship title from England's shores in 1920 and the attempt to keep it in 1921, as the story of a successful man which shows that opportunities exist in side streets and in tenement districts as well as in world-famed corporations.

The principal character is Garfield A. Wood. He is the man who, in 1912, paused on the street to watch the workmen referred to.

When a boy Garfield A. Wood was an inquisitive sort. He made it his business to find out all he could about everything that interested him. His father was the captain of a lake steamer and Garfield, who was born at Mapleton, Iowa, on December 4, 1880, moved to Duluth with his parents when he was still quite small. Duluth is a leading port of the Great Lakes and the steamer that Captain Wood bossed had Duluth as its home port.

At times his father permitted Garfield to become a passenger. On these occasions the boy spent most of his time watching the work of the hydraulic device that was used to reverse the engines. He was impressed with the ease with which the hydraulic pressure reversed the engines.

When 13 years of age Garfield was hired to supervise the operation of three power boats, purchased by the government for inspection boats in constructing the Duluth Harbor. These boats were of a cranky disposition and young Wood got the job because he could make the engines run although he was hardly strong enough to crank the three-horsepower engines.

Garfield spent as much time around the engines as possible. When not on trips with his father or at work on his power boats, he was investigating other engines, asking questions of the engineers and gathering information.

Interested as he was in engines, Garfield turned to the automobile and decided he would like to sell cars. He became one of the first men in the United States to sell Ford cars. He sold the Model N car in Duluth. The first car he received was No. 13, Model N, in a shipment of five cars.

Later he moved to St. Paul and continued selling Ford cars. Then he handled Ford sixes and had the first Model T's.

Becomes Interested in Power Boats

WHILE selling Ford cars in St. Paul he became interested in power boats for racing purposes. He cruised to Dubuque and attended the 1911 regatta of the Mississippi Valley Power Boat Association on July 4, making the trip to Dubuque in a small power boat.

At Dubuque he met W. P. Cleveland, who had the 14-footer "Leading Lady," carrying a six-cylinder two-cycle engine. The boat had much speed but Cleveland could not keep it running. Wood volunteered to put the engine in shape. Cleveland accepted the offer. Wood put in new bearings, changed the ignition and won the class race, making 30 miles an hour. This time set a new record for the event.

It was the following year when Wood met with the most important event in his life. Walking along the street one day he saw three men laboring to raise a dump truck body with a small hand winch. Wood watched the men for some time and then accosted the driver of the truck. He suggested to him that he could make a mechanical device that would do the work. The driver seemed dubious but Wood continued talking and the driver became partly convinced that Wood might really be able to go through with it. The following day the driver looked Wood up and told him that he would get him an order if Wood was able to produce the device he had outlined to him on the previous day.

At that time Wood was conducting a machine shop in connection with his Ford establishment in St. Paul. This shop was called the G. A. Wood Company. In this shop Wood set about to make good on his promise. He worked for one week and at the end of that time he had produced a crude hoist but one that really did the work. He sold it to the driver.

Wood, not lacking in imagination, saw the possibilities of his invention and visited a patent attorney. He explained to him in detail the invention and its possibilities. The attorney laughed at him. However, the attorney had a young assistant. This assistant had overheard the conversation and became deeply impressed with the proposition that Wood presented. He followed Wood out of the room and told him he would like to go into the matter. This he did with the result that the patent application, as made out by the young assistant, was granted.

Now, fully impressed with the possibilities of his device, Wood thought it a better plan to move near the center of industry, so he gathered his belongings and shipped to Detroit. There he opened a small machine shop.

Wood used a column of oil, forced into a cylinder by a pump operating off the transmission, to lift the body. This idea he received from watching the engines in his father's steamer when he was a boy and also from the fact that the engine was running while the three workmen were trying to dump the load of the truck that day in St. Paul.

Engineer at Age of 13

THE device was improved by Wood and a few minor changes made with the result that it opened a new field of transportation because it permitted excavating operations to be completed more quickly and reduced the number of men and trucks necessary.

During the war the Allies used 3,000 of Wood's hoists on one American-made truck, principally for building and repairing roads in the war zone. With this Wood hydraulic hoist in operation the trucks could discharge their loads rapidly and get out of the way quickly. It takes exactly 13 seconds for the truck to deposit its load.

One day a friend asked Wood how he happened to decide on oil for his hoist and he replied that the oil is self-lubricating and the average driver of a truck would not properly lubricate such a machine.

The first hoist that Wood built was used for an entire year without any replacements being made which in itself was a major accomplishment.

Now to return to the sport end of it and to the connection of the hydraulic hoist with the winning of the world's speed boat championship.

It was in 1912 that Wood invented the hoist and in that year he teamed with Cleveland in the annual motor boat regatta and won all class events for Leading Lady.

The following year Cleveland furnished the engine and Wood constructed his own hull. He named the boat Little Leading Lady and won every event that he could enter at Keokuk, Iowa, where the Mississippi Valley Regatta was held that year.

The hydraulic hoist was now a success. Money was coming in and Wood had the funds with which to pursue his hobby. In 1914 he took his Little Leading Lady to Peoria and again won every event he could enter. The next year he did not race but bought a small cruiser and cruised to Duluth, the home of his boyhood, and back.

In 1916 he made a Georgian Bay cruise and on his return he entered the express cruiser race in Detroit's first Gold Cup Regatta. He won but withdrew the boat when a protest was made that it did not comply with express cruiser rating.

During the autumn of 1916 Wood purchased the Miss Detroit from the Miss Detroit Power Boat Association, an organization of prominent citizens that had clubbed together and subscribed the money used in building the Miss Detroit, a boat that won the national speed boat championship for the Michigan city.

At Algonac, Michigan, Chris Smith, the boat builder, lived. He had had considerable success with building racing craft but Wood thought that he could have even more, so he set about to associate himself with Smith in constructing boats that would smash all previous speed performances on water.

Wood took the Miss Detroit to Smith's boat factory and had him build a new hull, so designed that it would permit a faster journey than the old hull did. He used the same power plant and with this new combination Wood succeeded in bringing back the national championship from Minneapolis in 1917 with the Miss Detroit II.

The following year Wood went after wider honors. He built still another craft during the wintertime, that is, Chris Smith and Chris Smith's sons built it, in company with Wood and with his assistance. This boat was christened Miss Detroit III in the spring of 1918 and it was the first hydroplane ever successfully equipped with an aviation engine, carrying a Curtiss 12.

With Miss Detroit III, Wood won the Thousand Islands trophy and again landed the Gold Cup, emblematic of the American speed boat championship. He also won the Canadian International Gold Challenge Trophy Race at Toronto but was disqualified for accidentally cutting a stake.

Wood still had the Miss Detroit II and with this earlier built boat he captured the Webb Trophy in the Mississippi Valley Regatta at Moline, Illinois.

In 1919 Wood again brought out the Miss Detroit III to defend her honors and the boat again came through for him, once more winning the Gold Cup.

Having conquered everything in sight in his own country Wood turned to other shores. England held the Harmsworth trophy, emblematic of the world's speed boat championship. England had held it for several years, and England expected to continue holding it. Wood pointed his efforts toward lifting it.

After the race season of 1919 closed Wood began laying definite plans for an invasion of Great Britain. His manufacturing achievements were paying him good dividends. He had become a wealthy man and with the riches he intended to go to the very limit with his hobby; he decided to bring back the world's race boat championship to the United States.

Wood talked to Smith, the boat builder. Together they planned the Miss America and the Miss Detroit V, both twin-engined hydroplanes. He presented the Miss Detroit V to his son, Garfield A. Wood, Jr.

Last summer Wood went to England, taking both boats with him. It was a costly undertaking. The expense did not matter with Wood; he wanted the title brought back to America.

66 Miles an Hour Fast Enough

THE international championship races were staged at Cowes, Isle of Wight, on August 10 and 11. Miss America, averaging 66 miles an hour, won the event and Miss Detroit V finished second.

It was not much of a race. Wood had planned for several years, had gone so deep into the subject, considered every angle so carefully that it was almost impossible to slip up. He knew the possibilities of his own craft and, before he was in England two weeks, he knew exactly the possibilities of the craft that would oppose him for the trophy. He went no faster than he had to to win; he had reduced the matter to an exact science.

Wood brought the Harmsworth trophy back with him. He returned to Detroit and in September, less than a month after he took the international championship, he once more won the Gold Cup. Having accomplished that he went after the one-mile championship and in this dash he "stepped on her." Miss America, under Wood's guidance, covered one mile at the rate of 78.23 miles an hour, the fastest any craft has ever traveled. This record also gives an idea that Wood, winning the Harmsworth trophy in a pace of 66 miles an hour, was not going nearly so fast as he could have traveled in the race at Cowes.

Odd Animals From Africa

Little Stories of Freaks Found in Wilds of Jungle.—By COURTENAY SAVAGE

African dik-dik, the smallest antelope, not much larger than a cottontail rabbit. The name comes from its peculiar cry, "dik-dik."

AFRICA! A land of vast forest tangles, the sunlight scarce trickling through the foliage, and rain pools standing for weeks at a time in the elephant tracks. Africa, a land of strange fancies—of savage men and beasts—of hidden mysteries from which come weird tales.

They tell, for instance, of animals that white men have scarcely, if ever, seen alive, of little beasts that men can stamp under foot and not kill, of birds whose devotion, mate to mate, is so wonderful that the natives believe the bill of the bird has charm to make a marriage happy, and of fishes with lungs that lie buried in the sun-caked mud of the dried river beds. Odd stories of odd animals!

The hero shrew is one of these animal oddities—a mouse-like creature, related to the mole family of our own country, and the other varieties of shrews that are found in many parts of the earth.

The hero shrew, however, is found only in two parts of the Belgian Congo. Easily recognized among the other varieties of shrew by its more clumsy appearance, the most striking characteristic of the hero shrew is the remarkable strength of its vertebral column. So strong is this backbone that the natives delight in using a captured hero shrew to give a public performance.

After much shouting by all those assembled, a full-grown man, weighing from one hundred and fifty to a hundred and sixty pounds, steps barefoot on the shrew. Balancing himself on one leg he stands there for several minutes, while the crowd keeps up its chatter. The poor shrew seems doomed, but as soon as his tormentor jumps off, the shrew, after a few shivering movements, calmly attempts to escape, not at all the worse for its experience. This escape is always marked by wild applause on the part of the crowd.

The ability of the hero shrew to withstand such pressure comes from the fact that the heart, and other vital organs, are protected by the very strong spinal column, which is made up of heavy, closely interlocking spines, and curiously convex behind the shoulder, forming an arch that resists tremendous crushing without breaking. During this exhibition care is always taken not to step on the head of the shrew.

Okapi (*Okapi Johnstoni* Sclater). It is found only in a small area of Western Africa, the Rain Forest of Northeastern Belgian Congo. Discovered by Sir Harry Johnston, in 1901.

The natives of the neighborhood where the hero shrew is found believe that the charred body, or heart, of the hero shrew, when properly prepared by one of their medicine-men, makes the wearer invisible. Those who are about to go to war, or about to engage in a wild animal hunt, always try to carry along some part of the hero shrew as a charm. Their great faith in its protective power stimulates them to courage, and in all probability this incentive to heroism led to the name "hero" shrew.

A full-grown hero shrew measures about eight or nine inches from nose to the tip of its tail. It makes its nest under the roots of trees, and insects constitute its principal diet. Its feeding habits offer no explanation of its enormously strong backbone. There are generally five or six babies in the nest during the early summer, funny little creatures, born naked, blind, and toothless, but soon able to run around and take care of themselves. Hero shrews are extremely shy, and are not often captured, for they hide in the dense undergrowth. They move deliberately, and in watching the escape of a captive it is easy to see that scent, rather than sight, points the way.

Another creature of the dense rain forests of the Congo which commands the interest of the few travelers who have been able to penetrate the jungle and actually see the beast, is the white rhinoceros.

A hundred years ago the white rhinoceros was common in South Africa, but the march of civilization has brought about its practical extinction, until the herds are small and scattered. In 1900 Major Gibbons came upon a herd far to the north of their usual feeding grounds, on the left bank of the Upper Nile, and during his African trip the late Colonel Roosevelt also found a small herd.

The natives of the Congo are really to blame for the extinction of the animal, for while the Belgian Government forbade sportsmen to shoot more than a single specimen, the natives were permitted to kill them at will for food.

The white rhinoceros differs from the Asiatic specimen in as much as it has no incisor or canine teeth, and its skin lacks the deep folds. Its color is not really white, but more of a slate. The horns are unusually large, a full-grown bull of a little more than ordinary proportions having a horn more than forty inches in length, and weighing thirty-eight pounds.

Then there is the okapi—the mystery animal of the mystery continent. Until twenty years ago it was unknown—man had never seen it, and what stories were told of its being were vague and conflicting. How such a large animal should have remained undiscovered can be explained only by the fact that the okapi is a hermit, living in the very heart of the forests — the wilderness that stretches half way across the continent. It is not a place for white men, this wilderness, for the heat, the moisture, and the tropic storms are practically unbearable —and the natives are hostile cannibals.

The existence of the okapi was first noted by Stanley, who explored much of Africa, in 1887, and who referred to it as "a donkey-like animal feeding on leaves, living in these swampy forests." Whether he saw one, or whether it was described to him, is not stated. However, in 1901 scientists secured a few strips of the striped portion of the okapi's hide, and impressed by the stripes, announced that they had discovered a new type of forest zebra. A little later, Sir Harry Johnston, one of the greatest of African explorers, obtained the coveted body of an okapi. It was found that the animal had cloven hoofs, and characteristics of the skeleton, especially the skull, proved that the animal belonged to neither the donkey nor the zebra family, but was a survivor of the giraffe group which lived in Southern Asia and Europe during the Miocene Ages, two million years ago. Though having the same ancestors, the okapi has practically no resemblance to the present-day giraffe, the two stumpy, skin-covered horns on top of the head, and the tuft of long bristles tipping the tail being the only external counterparts.

Writing of his difficulty in hunting the okapi, Herbert Lang, leader of a recent expedition into the Congo, says: "Having walked more than a thousand miles in the tracks of the okapi, I unhesitatingly state that its wariness and nocturnal habits effectively protect it from being successfully stalked by white men. Those who claim to have seen or shot an okapi have been favored accidentally. The natives often capture them in carefully arranged traps set in their trails. The okapi is a typical browser, feeding by night, often while rambling with a companion. The female invariably takes the lead, her ears alert for the slightest suspicious sound. During the day they generally rest, but sometimes move about when storms rage, and the falling leaves and branches drown the usual noises. While they visit the swampy regions, they spend by far the greater portion of their time in the higher parts of the forest."

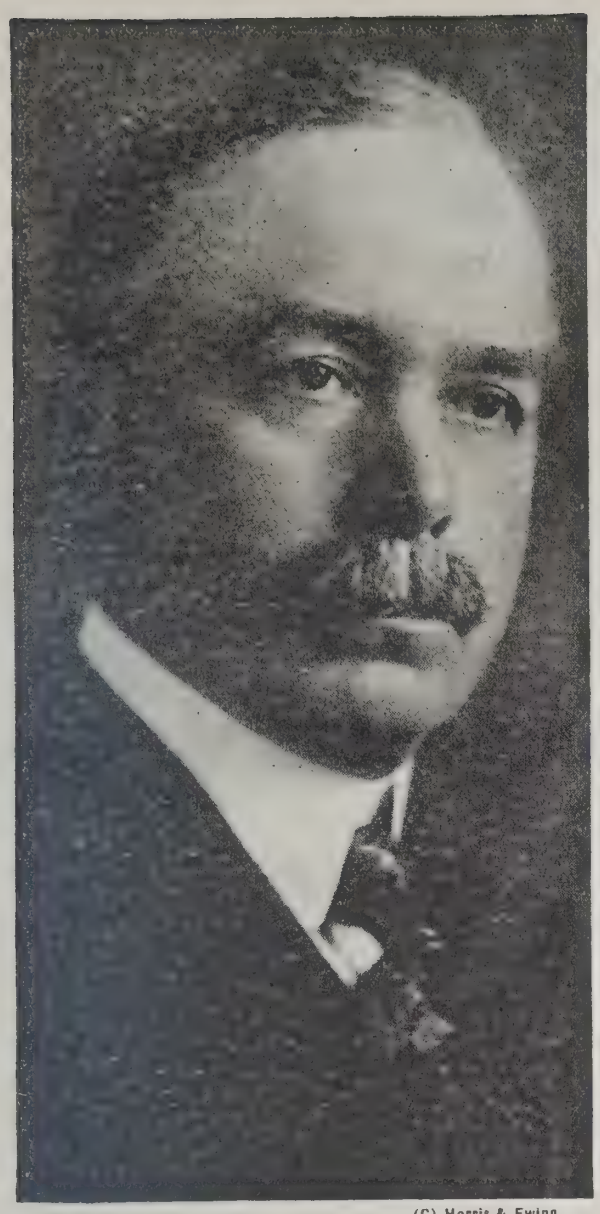
A big okapi stands five feet at the shoulders, the short heavy neck carrying a delicate, deer-like head. The body coloring is a glossy brown, or purplish black, set off by white stripes on the limbs, and a zebra-like pattern on the buttocks.

The African hornbill is one of the most remarkable birds of the earth, and quite as interesting as any forest dweller. It derives its name from its large horny bill. This bird often attains a length of four feet, and seldom measures less than two. In many species the large bill is surmounted by a casque, a helmet-like structure which in a highly developed form appears to be a second bill. In all but one species the bill and casque are hollow, the walls being thin, and supported inside by a lattice-like bony structure. The coloring is limited to black, white, gray, or tan. In some species the bill is red or orange, the skin round the eyes blue or bright red. Across the tail appears a white band. The wings are powerful and large. In flight they make a noise not unlike the passing of a distant train. The hornbill has well-developed eyelashes, rare in birds.

When the female hornbill is ready to lay her eggs she and her mate select a cavity in a large tree, the cavity being from fifty to more than a hundred feet from the ground. If the nest is not on the main trunk, it is on the underneath portion of a branch which is not near other branches, nor close to vines. This is so that the nest will not be disturbed by either snakes or monkeys. When the nest is selected the female enters and the male proceeds to wall up the opening, the female helping him from the inside. Only a narrow slip is left, room enough for the tip of the mother bird's bill, which is thrust through the opening to receive the food that the male bird collects and brings to his mate. The mother bird remains in this prison-nest for six or eight weeks, until the four white eggs are hatched, and the young birds quite fledged.

During all the imprisonment the male bird is very faithful, and the mother and her young emerge quite fat and well-fed, though the male has grown thin from his extra duties. In feeding his family the male hornbill clings to the tree much as our woodpeckers do, using his tail as a support.

A remarkable and interesting fact about the male hornbill of certain species is that during the nesting period, a sac some three inches long, and two inches in diameter, which is not in evidence at any other time, is used to store nuts, fruit, and berries, which are carried to the female. This storing allows the male to make less frequent visits to the nest, and helps keep the nest hidden. Part of this hiding is necessary because of the young birds which are born without down, and are blind until after the feathers begin to appear, a couple of weeks after birth.



Incidentally the monkeys and the snakes are not the only enemies of the hornbill, for the natives climb the high trees looking for the nests, knowing that they will find a nice plump old bird, and equally plump young ones.

The tail of the hornbill has a peculiar hinged joint, which allows the tail to be folded over the back—very useful when the nest is crowded. (The Toucan, a South American bird can also fold up its tail—probably because, like the hornbill, it nests in holes.)

The food of the hornbill is not limited to fruits and nuts, but the bird quite enjoys small snakes, lizards, flowers, and so on; in fact they are said to eat anything that they can beat with their wings and bill, and swallow whole.

Among certain tribes of the African natives it is believed that a man who wears on his neck the beak of a breeding hornbill can be sure of the love of his wife, and the newly married men wear this charm. This superstition undoubtedly

JAMES W. GOOD

Common Sense in Our Fiscal Affairs

By JAMES W. GOOD

Former Chairman of Committee on Appropriations, House of Representatives, who resigned to enter private business.

THE appropriations for the fiscal year, 1922, are showing a downward trend. The estimates submitted to the Congress for the fiscal year, 1922, and for deficiencies for this and prior fiscal years and for indefinite and permanent appropriations, aggregated $5,259,515,574.60. Assuming that the naval bill, when it becomes a law, shall carry the amount to which the House has agreed, the total of all the appropriations will aggregate $3,806,029,647.72 of which $275,256,005.21 is to supply deficiencies in appropriations for this and prior years.

This means a net saving, if the saving is the difference between the amount estimated by the late administration and the appropriations actually made by Congress, of $1,453,585,926.88. If we compare the appropriations made by the last session of Congress with the appropriations made for the fiscal year, 1921, just closing, we will find that we have made substantial reductions. If we take into consideration the deficiencies, we find that the appropriations for the next fiscal year are less than the appropriations for the current year by $898,247,910.46.

A stupendous task confronted the last Congress when it convened last December. In addition to enacting the necessary legislation that claimed the attention of Congress, it was necessary to conduct hearings and consider and pass the great supply bills. The problems confronted, as far as appropriations were concerned, were far more serious than those confronting any previous Congress. It was not difficult to make appropriations during the war, when it was necessary to scan estimates hurriedly and grant appropriations practically as requested. Not so during the session brought to a close on March 4. The war is over and the burden of debt left by it makes it necessary for the government to economize in every department. A degree of economy has been necessary that forced us to deny appropriations except for the most essential services. There are some services in which there can be no reduction, for some services of the government are constantly increasing and to permit them to function in a healthy way it will be necessary for the Congress to make larger appropriations every year.

Some New Powers Voted

A YEAR ago in response to a universal demand, Congress passed a measure creating a national budget, and while that bill was on President Wilson's table for his consideration, the House of Representatives changed its rules by providing for a single Committee on Appropriations to conform to the budget bill, so that the budget when submitted by the President might be passed through Congress as a budget. Unfortunately, President Wilson vetoed that great measure, and hence last year the estimates came in the old way, and the new Committee on Appropriations of thirty-five members, designed to deal with the budget, found it necessary to consider and make appropriations as before.

The House changed its rules in another vital particular, which increased the work of making appropriations. Rule 21 was amended so that Senate amendments, which would have been subject to a point of order if offered on the floor of the House to an appropriation bill, should be brought back to the House by the conferees for a vote. This change has taken from the conferees some of the power they have hitherto possessed; and has placed in the House the power to pass on all Senate amendments on appropriation bills carrying legislation.

Those who have closely followed the history of appropriation bills realize the power of conferees under the old system. Not infrequently were several pages of legislation added to some of the annual bills. Some of this legislation was often repugnant to the members of the House, and most of it was never understood, not even by the conferees themselves. It was legislation sent by the departments on which there were no hearings and for which the necessities were never explained. Too frequently such amendments were incorporated in the conference report, and the members of the House never had an opportunity to discuss, consider or vote upon the legislation which was thus placed upon the statute books. They were compelled either to vote up or down an entire conference report. This is a grave responsibility, and the average member would rather shut his eyes and vote for a conference report, even though it carried legislation in which he did not believe, rather than assume the responsibility of voting against a great supply bill.

Rule Needed, Use Shows

WHEN this rule was changed and until about February, it was confidently predicted by well-informed members of the House who are familiar with the history of appropriations that the proposed change was unworkable and that too much time would be involved in considering Senate amendments. That rule has lived long enough to justify its existence and prove its great value. During the last session of Congress every important Senate amendment carrying legislation was laid before the House, and on each of those amendments the House took a separate vote. The retention of this rule and the strict enforcement of it will maintain for the House its proper place in the legislation of the Congress. I believe it marks the dawn of a new and better day for the honor and dignity of the House.

It may need to be modified, but in principle it will live, and it will preserve and strengthen the rights of the House. When this experiment is tried on the budget—and I hope we may soon have a budget law—we will thereby permit the great legislative committees of the House to turn their attention and study to matters of legislation over which they have jurisdiction. The Military Committee will be composed of men who will be the greatest experts in the United States on military law and the activities relating to the Army. The men who compose the great Naval Affairs Committee will become the most expert men in the United States on all questions relating to the Navy. The Committee on Foreign Affairs will have in its membership men who are schooled in the diplomatic history not only of our own country but of the world. They will become experts in the highest sense.

Budget Reform Needed

IF THE Senate continues to put legislation on appropriation bills these experts will be on the floor of the House to attack or defend such legislation. Their knowledge and experience will then be available and will be most valuable. They will be able to force this legislation from appropriation bills. Under the old system gentlemen had no choice when it came to adopting a Senate amendment, because legislation would be placed upon an appropriation bill by the Senate, and the House did not have an opportunity to vote upon the merits of such legislation, but must vote for or against the entire supply bill in which the amendment had been incorporated.

Budgetary reform is an essential phase of the trend toward economy and efficiency in making provision for the fiscal needs of the United States Government. It should not be inferred from what I have said that the financial requirements of the government for the next fiscal year will be $898,000,000 less than they have been for the current year. They ought to be very much less than that. How much less it is impossible to state at the present time with any degree of definiteness.

Provision had to be made for the fiscal year, 1921, for about $1,500,000,000 or more, for which there will be no corresponding requirements during the next fiscal year. Of that sum, about $1,400,000,000 was for railroad requirements; $150,000,000 to continue the construction of the merchant ships that were contracted by the Shipping Board during the war; $57,000,000 for the purchase of obligations of foreign governments, and about $100,000,000 to discharge other contracts entered into during the war.

It looks to me, therefore, that the future, as far as our government finances are concerned, is bright when contrasted with the situation presented two years ago when the Republican party took control of the House. Then, and since, huge estimates were made in time of peace to carry on activities assumed during the war. In the two preceding sessions of the last Congress the Republicans reduced the estimates made by the administration by $2,710,000,000.

Financial chaos would have remained if the Republican Congress had not stood between the Treasury and the onslaught made upon it by a wasteful and extravagant administration. The policy adopted provided for a minimum of new construction and to reduce estimates wherever a reduction could be made without the serious impairment of a necessary government service.

The Committee on Appropriations, moreover, commenced its work with very definite convictions. It realized that there could be no substantial reduction in taxation until there was a substantial reduction in appropriations.

Since the signing of the armistice large sums have been expended for war supplies and materials, and other large disbursements have been made in the cancellation of contracts made during the war. But this war hangover, as far as accounts payable are concerned, is largely behind us. Looking at the matter in a broad way, it has seemed to me that if we do not by additional legislation take on new obligations in the way of financing activities heretofore financed by individuals or corporations, and if we do not take on additional government functions involving large expenditures, we should be able to keep the appropriations to within $3,500,000,000 and possibly less.

The Committee on Appropriations has consistently urged Congress to refrain from embarking upon new services at this time and opposed every effort to broaden or extend the Federal aid provisions, for it has been forced to realize that the government can meet its expenditures in but two practical ways: first, by levying taxes, and second, by borrowing money. The taxes must come from the very people who pay taxes in their respective states. We certainly will not borrow money to engage in new enterprises; and the government ought not to tax the people of a state to carry on the very work which the state is authorized to do, and for which the local state and county governments have ample authority to levy local taxes.

Urge Repeal of Profits Tax

AN ANALYSIS of the receipts under the war revenue act will, I believe, show that by the repeal of the excess-profits tax there will come into the Treasury under the income tax provision alone $1,500,000,000 a year. Unquestionably the excess-profits tax is in a large measure passed on to the consumer, and is one of the elements that has tended to keep living costs excessively high. That tax can be repealed, and it ought to be repealed.

We will not need the revenue brought in by excess-profits taxes if we will adhere to a policy of cutting down appropriations to the normal requirements of an efficient government. There is where we can effect a saving. We can avoid the payment of that tax or a substitute tax (I think a sales tax is not wanted by the people) by a system of economy and national financing of temporary loans, such as our certificates of indebtedness, War Savings stamps, and the Victory notes.

There will mature within the next three years certificates of indebtedness, War Savings stamps, and Victory notes of approximately $7,000,000,000. Shall we continue to lay this heavy tax upon American industry so as to pay this indebtedness within the next three years, or shall we refinance these obligations by loans rather than by taxes?

During the next few years we will go through an era of unemployment and social unrest. The man who does not realize that fails to read the signs of the times. How will the laboring man feel, while out of employment or with a small income, if he is compelled to pay a tax on everything that he eats and everything that he wears? Not realizing that the excess-profits tax has been passed on to the consumer and that in the past he has been compelled indirectly to pay it, he will become bitter in his resentment at a Congress that repealed a tax required out of excess earnings only to substitute a direct-consumption tax, which he must pay. Congress must keep in mind the fact that all taxation must be fair and just, and that in levying new or substitute taxes great care should be exercised not to antagonize unduly the man who earns his living by the sweat of his brow. It might result in disaster.

Increased Production Needed

ONE of the things that we most need in America today is increased production. Practically every business concern, be it great or small, is hampered today because of a lack of capital. When we require that so large a portion of the earnings of industry shall be paid in taxes, we leave but little available for the growth and expansion of business. If by the repeal of the excess-profits tax and a reduction in the surtax we can permit American industry to keep a greater portion of their earnings to take care of their increased capital demands, we shall in a broad and constructive way do much for the upbuilding of a bigger and better industrial America.

There are a number of ways by which taxation legislation may be simplified and improved. The government's receipts last year, broadly speaking, totaled $7,141,564,649.96. The four billions necessary to raise next year could be derived somewhat as follows: Customs, $400,000,000; income and corporation taxes, $1,500,000,000; miscellaneous taxes, $1,250,000,000; miscellaneous receipts, $500,000,000; postal revenue, $500,000,000. The allotment suggested would exclude excess-profits taxes with no direct substitute provided, while at the same time providing for an equivalent for the repeal of the transportation tax. The half billion annual interest on our foreign credits is likewise left out of consideration.

As I see it, therefore, the problem faced by the government in its fiscal affairs is one of economy on the side of appropriations and expenditures, and one of a more businesslike and efficient taxation program.

Do You Know What Your Children Read?

By HELEN PUTNAM VAN SICKLEN

WHAT thought do we ever give the children in the public library other than to observe, "What a cute little room! Bless their dear little hearts!" as we peek into the nursery-like juvenile department; or perhaps to smother a desire to spank them when they noisily invade the grown-up precincts?

To be sure, every now and again some thoughtful editor publishes a list of "Books a Boy Would Like." A list probably beginning with Victor Hugo, Scott, and Dickens, Charles Reade, Washington Irving, Kingsley, Halevy, Shakespeare, and Charles Lamb. It includes something of Drummond, Ruskin, Emerson, Maeterlinck, Stevenson, Wordsworth, and Longfellow, Rider Haggard and George Ebers, Tennyson and Lew Wallace; Homer, Vergil, Dante, and Goethe in good English translations; Oliver Goldsmith and Conan Doyle. Mark Twain, O. Henry, Hawthorne, and Poe are there, too, along with Barrie, Jack London, and John Fiske. Something on creative chemistry and the world's food resources, with perhaps Well's "Outline of History" complete the list. Its author (in this case I quote Frank Crane) explains that "it does not pretend to be anything else than books a boy will read, books that will make him a lover of books, and books that will do him no harm. They will not give him an 'education' nor make him religious, nor in any way supply the need for other serious study. Just books that I, now over fifty, would want were I eleven."

So may the lads now eleven agree when they, too, are become thoughtful, gray, and fifty.

But in the meantime what ARE they choosing from the open shelves of the public libraries? What are they reading at the rate of two or three books a week till you wonder they have time for any constructive, original thought or work or play?

They Like "Story Books"

IN MOST cities one needs only to be a resident nine years old or over to become a card-holder or "member" of the public library, and each card-holder is entitled to borrow two books at a time; one fiction or "story book" as the youngsters call it, and one non-fiction book. Non-fiction being everything else—art, music, literature, myths or fairy tales, poetry, religion, science, history, biography, travel, sports.

Now a parent in the children's department is a rarity. Usually even the smallest children choose their books unaided, for children are much less dependent on the librarian than the average grown-up. They consult with each other. The leader of the gang doubtless has more influence on the other boys' choice of reading than parent, teacher and librarian combined.

Nine youngsters out of every ten will first try to take two "story books." Failing that (for the librarian is usually alert enough to detect them even in the busiest hours), somewhat bored by such rules, they will turn to the non-fiction shelves. Just how enthusiastically these are read is another matter. They are seldom sticky and worn.

A hasty glance through this section will suffice to show you what is most read here. The smaller Americans and the little foreigners of all sizes, especially the Chinese and Japanese, are very fond of fairy tales. The foreigners take biography and history, which most young native Americans overlook. Books on aircraft, electricity, any kind of engineering, inventions, carpentry, and, most of all, wireless, appeal to the American lad. Girls are not very fond of handicraft books, though such books as "How Boys and Girls Make Money" have wide circulation. Works on music, art, literature and poetry seldom move save for occasional school work. Ernest Seton-Thompson, C. G. D. Roberts, and Maeterlinck enjoy a limited popularity, but as a rule children prefer their natural history in story form with the animal doing the talking. Titles such as, "The Book of Battles," "Pirate Explorations," "Daring Deeds in the Dark Forest" always attract the boy. Translations of the Odyssey and the Iliad are fairly popular, for Ulysses or "Useless," as the boys are prone to call him, is a "pretty good guy." Camping, recreation and sports are eagerly read.

Travel Books in Demand

TRAVEL books the wee folk like best are "Peeps at Many Lands," "Our Little Foreign Cousins," and the "Twins" series. The older boys especially like Paul du Chaillu and Thomas Knox' travel works, while their history is preferably American and French. But they like their "larnin'" best in story form. "Too much facts" is a frequent youthful criticism.

The youngest children adore stories of Brownies and of Pinocchio the Marionette. The children's librarian in the San Francisco library calls the Baum stories of the land of "Oz" the most universally popular fiction in the library. Says she: "The Mammas and Daddies frankly enjoy them with the small tots, who scramble to get them; the older boys sheepishly slip out with them, while the girls quite shamelessly read them." Animal stories of the Thornton Burgess type (Bailey, Paine, Trick, and Potter write similarly) are close seconds in popularity. If you are not acquainted with these tales, a few titles will tell you much: "Adventures of Grandfather Frog," "Jimmy Skunk," "Poor Mrs. Quack," "Prickly Porky," "Tale of Cuffy Bear," "Solomon Owl," "Jemima Puddleduck." These are always "out" in circulation, seldom ever reaching the shelves, for as one child returns one, another stands waiting to take it. "Heidi," "Cornelli," and the half dozen others of Frau Johanna Spyri are great favorites of the small folk, as are Sophie May's "Dotty Dimple" and Amy Brooks' "Dorothy Dainty" series.

One librarian in discussing girls' books said: "On the whole the girls are better off than the boys, for they have their own stuff and the boys' books, too." Of course, no boy would deign to read a girl's book! Only occasionally, as in the case of Augusta Howell Seaman's mystery stories, are the boys "taken in." "Slipper Point Mystery," "Three Sides of Paradise Green," "Boarded Up House" and "The Sapphire Signet" are always in demand, for the most oft-repeated request is for "something exciting, please." Still a boy can't seem to help an expression of disgust and mortification when he finds he's actually enjoyed a story written by a woman for girls!

A bit of romance is wild adventure for the girls. They're never too young for a love affair. A fairly brief list will acquaint you with the girls at school, and in the social whirl, who are the favorite heroines of today. Of course "Little Men" and "Little Women" (Alcott) are still beloved. "The Little Colonel" (Johnston) and "Patty" (Wells) are probably the two most popular girls in juvenile fiction. "The Five Little Peppers" (Sidney) and "Pollyana" (Porter) fill a place of their very own. "Isabel Carlton" (Ashmun), "Sylvia Arden" (Piper) and "Betty Wales" (Warde) each star in a series of high school and college stories. "Co-ed Stories" (Lee) are similar. Other books and authors quite as popular are: "Loyal Blue and Royal Scarlet," "Beth Stories" (Taggart); "Marion's Vacation," "Nora's Twin Sister" (Rhoades); "Responsibilities of Buddy," "Janet at Odds" (Ray); "Glenlock Girls" (Remick); "Another Flock of Girls" (Perry); "From Sioux to Susan," "Gentle Indifference of Bab" (Daulton); "Anne of Avonlea" (Montgomery). "Campfire Girls of Brightwood" (Blanchard) and "Mrs. Manning's Wards," "A Popular Girl" (Baldwin) are English stories well liked.

Given good illustrations and a boy for a hero—say a boy with a dog and a gun off to war or a gold rush; in search of buried treasure or on a marvelous engineering feat; winning fame in the athletic world or at college (Annapolis and West Point preferred); given also the appealing title, and you simply couldn't stop the popularity of that book with the boys. Glance through this list of war stories, the great World War being most interesting just now: "On Secret Service" (Gilson); "Tommy of the Tanks," "Knights of the Air" (Lynn); "Fix Bay'nets" (Fenn); "Forest of Swords," "Hosts of the Air" (Altsheler); "In the Trenches" (Botsford); "Winning His Wings" (Westerman); "Sergeant Ted Cole, Marine," "Scouting with General Pershing" (Tomlinson); "Wonder of the War" series (Rolt-Wheeler).

Children's Tastes Differ

HENTY? Yes, indeed, his stories of nearly every land and its wars are read enthusiastically. Here, though, is a specific instance of the difference in literary tastes of boys in different sections of the same city—which makes us wonder just how the boys of the East or South differ from these far western lads of whom I speak. At San Francisco's main library, located on the edge of the down-town business section, the Henty books are exceedingly popular. At a large branch library in a pleasant residence section, they seldom move from the shelves. Why? Who knows, when so small a thing as shelf location may be accountable? Top shelves the least bit high, bottom shelves the least bit low, and about all the attention the books there get is dusting. The tiniest, limberest child will not stoop way down.

Boy adventure stories cover so wide a range of subject there seems little left unwritten. The love for "Treasure Island" (Stevenson) and Jules Verne's tales never wanes.

"Schultz lived with the Indians and his stories are true," a lad will inconsistently explain when borrowing "The Great Apache Forest," "The Gold Cache" or "On the War Path." Just another example of "facts" cunningly presented as "fiction."

Gold rush and western stories are numerous. These are some the boys most approve: "Buffalo Bill and the Overland Trail," "Gold Seekers of 49," "Bar B Boys," "Cowpunchers"; "Lost With Lt. Pike" (Sabin); "Ross Grant" series, as a tenderfoot, on the trail, in a miner's camp (Garland); "Buried Treasure" (McNeil); "Young Alaskan" series (Hough); "Connie Morgan" in the lumber camps and with "the mounted" (Hendryx); 'The Steam Shovel Man" of the Panama Canal (Paine).

"Blackbeard's Island" (Holland) and "Billy Topsail & Co." (Duncan) are of sea adventures. "Jack Heaton," oil prospector and wireless operator, (Collins); "Boy Electricians" series (Houston); "Camp Brady Wireless Boys" and "The Hidden Aerial" (Theiss) inspire every boy to own an outfit. "Boys of the Otter Patrol" (LeBreton) is the kind of Boy Scout story that attracts.

You can't preach much, either; the boys will ignore you. Yet Trowbridge in his many war and adventure stories offers a mild form of preaching so well sugar-coated that they swallow it whole. See "Doing His Best," "Drummer Boy," "Fast Friends."

Youthful newsgatherers, too, are splendid heroes; for instance, "Mark Tidd, Editor" (Kelland); "The Cub Reporter" (Wooley); "Under Orders" (Monroe).

This group of authors has written a little of everything, all popular: Monroe—"Dory Mates," of fishing; "Fur Seal's Tooth," Alaskan; "Cab and Caboose," railroading; "Derrick Sterling," mining.

Otis—"Raising the Pearl," ship stories; "Aeroplane of Silver Fox Farm," series; "Minute Boys," historical series; "The Lifesavers," of the U. S. Life Saving Service.

Stoddart—"Chumley's Post," of the Pawnee trail; "Lost Gold of the Montezumas"; "The Farm that Jack Built." This last one is surprisingly popular with the little city boys.

Last, but by no means least on my list of what boys DO read, come the stories of school life and sports. There's "Ice Boat Number One," "Freshman Dorn, Pitcher" (Quirk); "Winning His Y," "Fullback Foster" (Barbour); "The Half-Miler" (Dudley); "Catcher Craig," "Pitcher Pollock," "Second Base Sloan" (Christy Mathewson). "T. Haviland Hicks" (Elderdice) as a freshman, sophomore, junior, and senior spends four thrilling years at college. "Army Boy Series" (Capt. Kilbourne) are West Point stories, so popular they're often stolen. "Roger Paulding" and "Ralph Osborne" (Commander Beach) are Annapolis lads winning their way to official rank. "U. S. Midshipman" series (Com. Sterling) are the same type. How the boys do esteem the author with the military or naval title!

Australia Torn by Cash Gift to Premier

SHOULD the head of a government accept a reward of value from the citizens he serves, or from any group of them?

The question is raging in Australia, just as it raged in England some years ago over the famous Turnerelli wreath. William Morris Hughes, premier of the Commonwealth, has accepted a check for $125,000 for distinguished patriotic services during the war period. No one questions that he performed the services. The question is whether as prime minister he should accept a public subscription.

Mr. Hughes entered politics a poor man and has remained one. Like all Australia's prime ministers Mr. Hughes has never attempted to make use of his office to secure advantages which could be construed as personal benefits; he has used it in the accepted way for party political advantage. The real point is whether a man will or will not be deflected unconsciously from his public duty by the remembrance of substantial monetary favors.

This question is of particular importance in Australia where the government's administration affects every trivial interest. Mr. Hughes, when he accepted the gift, confessed his poverty and recalled that years ago, before he entered politics, he was forced to sleep several successive nights in a public park. It is a fact, also, that most of Australia's leaders have left office impoverished, and none has asked or cared what happened to them afterward.

Years ago an attempt was made to raise a public subscription to Sir Henry Parkes, premier of New South Wales, at once one of the most powerful and one of the very poorest financially of Australia's public men. He declined the gift, saying there would be inevitably the imputation that he might not forget, in his legislation, the men who had been good to him.

No one ever has been quite sure what motives decided Lord Beaconsfield in refusing the Turnerelli wreath. Edward Tracy Turnerelli, a sculptor's son and himself a sculptor, as well as a writer of topical verse and pamphlets, was a student of foreign affairs, and especially of Russia, where he spent much time. He opposed the Crimean War, as did John Bright. And he won attention by his steadfast prediction that Kronstadt was impregnable, a prediction amply verified later.

He conceived the idea that the Conservative workingmen of Britain should subscribe each a penny (two cents) to present Lord Beaconsfield with a gold laurel wreath. It was to be "The People's Tribute" and was in particular recognition of Disraeli's work at the Berlin Congress.

Fully 52,000 workingmen subscribed their pennies for the wreath, each leaf of which Turnerelli estimated would cost $25. The wreath still exists and is on view in England. Each leaf is of gold, and under each one is inscribed the name of a town where a committee collected the pennies. The "tie" bears the inscription "Tracy Turnerelli, chairman."

The wreath became the subject of hundreds of jests and lampoons, London amusing itself highly with the subject. Suddenly, the workingmen having subscribed their pennies, the wreath being completed, and exhibited for some time, Beaconsfield announced he would not accept the gift, and poor Turnerelli was left with the wreath on his hands, and unable, of course, to return the pennies of the subscribers.

Turnerelli himself took the matter much to heart. He explained the refusal by saying that a "high legal functionary" had warned Beaconsfield that the wreath was a typical "Imperial diadem" which could only be loyally offered to a sovereign. The adviser added that the promoter of such a presentation would have been consigned in previous reigns to the Tower.

However that may be, the fact remains that Disraeli did not repudiate the gift, although its preparation was given wide publicity from the start, until it was too late for Turnerelli to do anything but sell the wreath or bestow it, as a curio. His remonstrance seems a little tardy.

In his will Turnerelli wrote: "I leave the gold laurel wreath to the nation, provided my generous friends, the Conservatives, will help me to cover the hundred and fifty pounds or thereabouts I have personally expended upon it."

The discouraged sculptor designed his own tombstone, which is surmounted by an imitation in stone of the famous rejected wreath. He died in Leamington, England, in 1896, in his eighty-fifth year.

Uncle Sam's Lady of the Fungi

IF YOU should want to know about fungi—and before that word scares you away let it be said that you and virtually everybody want to know about fungi—you probably would finally go, in person or by letter, to the subject of this article. She is the directing head in one of those mysterious offices buried in the great masses of brick and stone that house Uncle Sam's scientific workers in Washington.

There, if you should go to the office in question, you would find a silver-haired lady who looks at you over her spectacles and from dancing eyes that would paralyze you with shame, but not fear, in case you dared to think of the word "old" in association with her. She isn't afraid of, but, on the contrary, defies dates.

Without adhering to the customary persiflage of chivalry, it can be truly said that Mrs. Flora W. Patterson is of the type that never grows old despite the passing years. But for historical accuracy as well as for the lessons that may be drawn from them certain dates must be set down, as for example:

The year 1847 during which she was born, that of 1865 when she graduated from college, that of 1869 when she married, that of 1890 when she returned to college, and that of 1896 when she joined the scientific corps attached to the United States Department of Agriculture.

Quite a period of time elapsed, as you will observe, between the middle and late sixties and the early and middle nineties and a fair period of time since the last.

What the writer is driving at may be illustrated thus: Three good "lessons" could be evolved from the facts in question. The first would come from the fact of a woman after being a successful wife and mother returning, as a student, to college, or rather to colleges and universities, for Mrs. Patterson attended several after her two sons were grown or nearly so. In truth, while she was completing her scientific studies at Harvard her youngest son was in the freshman class at the same institution. The second would have to do with the fact that for the succeeding quarter of a century she has been a big figure in Uncle Sam's organization of scientists, an organization in which women have not always been conspicuous. In length of service, she is the oldest woman doing scientific work for the government. The third might have to do with her work, a very important and difficult work which she took up and mastered at a time of life when most women are settling down irrevocably to the tedium of domesticity.

Mrs. Patterson was born in Ohio, the daughter of a clergyman, and received her first school education at Antioch and the Ohio Wesleyan, from which latter she received the A. M. degree shortly after the close of the Civil War. Marrying a few years later, she devoted about twenty years to the duties of a wife and mother. Then when she lost her husband, through death, and her two boys were ready for college, she looked around for something to do. She decided to return to school herself. So she enrolled as a student in the Iowa State Agricultural College, where she specialized in science, and gained another A. M. degree. Then she went to Harvard and took a post-graduate course in botany at what is now Radcliffe College and was then known as the Harvard Annex. After that she did work in plant pathology and mycology at the Gray Herbarium for a year.

"Why not get a place with the government?" she was asked one day.

"Oh, they wouldn't employ a woman for scientific work," she replied. However, she filed a formal application and was astonished when, within a short time, she was directed to take a scientific examination. She passed with creditable rating and was immediately offered a job in the Department of Agriculture.

It was found important long ago that we learn all that we possibly can about fungi, for it can be helpful as well as harmful to human life. There are probably more than 25,000 species, ranging from microscopic organisms, like yeast and mould, to big umbrella-like plants as in the case of the large mushrooms. Some can be eaten with benefit by men and other animals, others are highly dangerous when eaten. Many cause serious diseases in the plant world and a few cause diseases among animals, inclusive of human beings.

To keep the scientific trails into the fungi world open and clear, it is important that specimens of that form of life be gathered, studied, described and be kept where they always would be easily available.

The Agricultural Department had begun to develop a fungi herbarium when Mrs. Patterson came into it. Her work in bringing order out of the mushroom situation led to her being placed in charge of the fungi herbarium.

It is one of the biggest in the world. It now contains more than 95,000 specimens of fungi life and thousands of others are being added annually. In addition a catalog describing each of them and their hosts—for fungi usually are parasitic, making it important to know on what other forms of life they live—together with all developed information on the subject, is preserved in orderly form.

So when authoritative information is wanted on some fungi problem—be it the edibility of a mushroom or toadstool or the habitat and habits of some microscopic organism that is found to be playing havoc with rose vines or fruit trees—the search nearly always leads to the herbarium Mrs. Patterson has evolved and still directs.

If you don't believe there is much interest in fungi, drop in there some time and note the queries that go to Mrs. Patterson and her associates. In spring and summer, Mondays usually are very busy days with them, for then people in the vicinity of Washington stroll in requesting that samples of mushrooms collected in the open on outings the day before be passed upon. Other inquiries from all parts of the country go to Mrs. Patterson's office.

"If you are not an authority on mushrooms, it is best to let them alone until you do become an authority—that is to say, don't eat them unless you know what you are about or get them at eating places where they take care to serve only the right ones," Mrs. Patterson declared to the writer.

"Many of those that are edible look very much like others that are poisonous. There is one class that is both edible and poisonous but the varieties are so nearly alike that only a microscopic examination can tell which is safe and which is not."

While Mrs. Patterson, through her studies and the bulletins she has helped prepare, assisted considerably in developing the growing and eating of edible mush-

MRS. FLORA W. PATTERSON,

Who after raising two sons went back to college—for a time being a college mate of her youngest child—equipped herself in botany and mycology and became one of the Government's important scientific workers.

rooms in this country, she does not recommend any of the fungi plants for high or solid food values.

"The edible mushroom has about the same calorie worth as cabbage and about one-half that of the potato," she says. "But, of course, their flavoring makes them worth while. Be very careful in choosing those you eat and, if you cultivate them, in those you grow."

One species commonly prevalent in this country has very virulent intoxicating qualities. The same mushroom is used in Russia for distilling a potent beverage, and a recent writer says that it is eaten dry, for its intoxicating effect, by some members of some of the tribes in Siberia.

Mrs. Patterson believes that the field of scientific research offers splendid opportunity to women in search for careers.

"Women's inquisitive instincts, their devotion to system, their patience and their interests in all problems that affect human life, may give many of my sex a special penchant for several kinds of scientific work," she said. "When I took up this kind of study, a woman was rarely encouraged to enter the scientific field. The work of Madame Curie and that of many other women show what women can do in the scientific world.

Mrs. Patterson shows her belief in the woman scientific worker by the make-up of her own organization. Her first assistant is Miss Vera K. Charles, a mycologist of distinction and on her staff are several other women who are authorities in that line of research. Men are not excluded, for her corps includes several who rank high. One of her force does a particularly unique work. She, Miss Edith Cash, a young woman not long out of school, is able to read and translate fungi data when found in as many as six languages.

If you don't believe that the job of keeping tab on the fungi world for the National Government and very largely for the United States is quite a job, note the following first sentence from a long article in the Britannica Encyclopedia:

> "FUNGI—(pl. for Lat. Fungus, a mushroom). The botanical name covering in a broad sense all the lower cellular cryptograms devoid of chlorophyll, which arise from spores, and the thallus of which is either unicellular or composed of branched or unbranched tubes or cell-filment, (hyphol) with apical growth of more or less complex wefted sheets or tissue-like masses of such (mycelium).

Yet Mrs. Patterson, with a corps of mostly women assistants, takes care of the job in apple-pie order.

How Watching "Everything" Won Fame and Fortune

Concluded from page 11

That finished Wood's work for 1920. Last winter he went to Miami, Florida, where the express cruiser championship was to be decided. He entered his boat Gar Jr. He won the race. Then he went out and won two ocean races. Having accomplished this he busied himself with another scheme and decided that his boat could travel from Miami to New York in less time than it took an express train. He won, covering the 1,300 miles in 47 hours and 25 minutes. This beat the fastest train time by 21 minutes. Wood continued and set another record, covering the distance between Miami and Detroit, via Hudson River, New York barge canal and Lake Erie, a distance of 2,200 miles, in 84 hours.

Late this summer Europe will try to take the Harmsworth Cup back to the other side of the Atlantic. Europe has been busy for six months building new speed boats, according to new designs. These boats are planned to beat anything that Wood has brought out or anything that he might be able to bring out with the assistance of Chris Smith, the boat builder. In the meantime Wood has been busy himself. A man who spent as much time and thought and energy to win a thing like a world's championship is not liable to let it slip because of lack of effort.

Wood has been successful where other men failed. Several wealthy men in this country have tried their hand at motor boat racing, purchased fast boats or had them built and employed skilled mechanicians to run the boats.

That is where Wood differs from them. Wood himself supervises the construction of his boats and helps build them. He drives his boats himself or where he has two boats in a race, the other one is piloted by an assistant.

Wearing an oilcloth "union" suit, with life preservers strapped about his waist, Wood holds the pilot's seat and this is a neat trick, for a boat that goes 50 miles an hour or faster behaves with less grace than a bucking broncho. The high-powered craft, attaining high speed, leaps out of the water and skips over the surface. If you have ever watched boys "sailing" flat stones over the water, you can have gained an idea of how a motor boat behaves when it happens to be a boat with enough speed to compete for the Gold Cup. Few men care to drive one.

Wood learned all about engines, all about racing that it is possible to learn and then learned all he could about boats. Using this knowledge, his money, time and patience, he developed the speed boats that have brought the highest honors to the United States and he guided them to victory.

As remarked in a previous paragraph, Wood is today a wealthy man. He operates three factories in Detroit, one in Windsor, Ontario, and has an assembling plant in Paris. He has sold more than 60,000 hoists which enabled him to pursue a hobby to an end marked with the ultimate success he could achieve.

Wood is a man who is tall and slender. His hair is gray and he is usually smiling. He is modest but can deliver what the members of any chamber of commerce would describe as a good talk and he has a keen sense of humor. Also, he is most inquisitive. If he did not happen to be inquisitive he would not have stopped on the street in St. Paul one day in 1912 and watched three laborers try to unload a truck. If he had not stopped he would not have conceived a big idea, that of making a hydraulic hoist, and if he had not conceived the big idea he would not have had the money to develop speed in power boats and had he not developed that, England would still be holding the Harmsworth trophy and the international speed boat championship and would not have to come to the United States this autumn to try to win it back.

Odd Animals from Africa

Concluded from page 12

had its foundation in the devotion of the hornbills for one another and their nest-home—the native hoping his home will be as well cared for and as happy. Hornbill beaks are also fastened to the waists of young children as a cure for malnutrition, for mothers know that young hornbills are well fed, and hope that the charm will fatten their little ones.

From the African rivers come the lung fish, yellow in color, eight or ten inches in length, and looking not a great deal unlike the eels that are found in less tropical lands.

The lung fish has true lungs instead of the usual gills, and so can live without water. In the rainy season they live in the shallow rivers, frequently coming to the surface to breathe, and the natives spear them from rafts. During the dry season the river-bed shrinks to a small sluggish stream. As soon as the waters begin to go down the lung fish burrow into the mud, curl themselves up, and lie waiting for the first heavy rains. They get air through the holes in the mud, and these holes are a guide to the natives who dig them out as they want food.

Still another forest dweller is the dik-dik, or dwarf antelope, which is the smallest antelope known to science. The dik-dik is an exceedingly graceful little animal, about the same size as our cotton tailed rabbits, and has short, very sharp, spike-like horns. It is shy, and not easily taken by sportsmen or explorers, keeping well under cover in the jungle tangles. When it is alarmed it gives a shrill whistle as it races away, "dik-dik," and it is from this cry that it takes its name.

BRIEFLY TOLD

Although ninety-six per cent of the twenty-two thousand inhabitants of the Aaland Islands speak Swedish, they have formed part of Finland for more than a century.

National, provincial and municipal authorities in Austria may requisition land not in use for public playground purposes. Such land is in charge of organizations interested in the promotion of outdoor recreation, the owner of the property receiving suitable compensation for its use.

Not more than ten per cent of the Franco-American marriages contracted during the war have been successful.

A group of Chinese girls, daughters of wealthy families in China, are now students at "finishing" schools in Paris.

During his thirty years' pastorate at a Cincinnati church, a minister kept eight colonies of bees in the church tower. It is said they would range fifteen miles for honey.

Belleau, the little French village on the edge of the Belleau Wood foothills, is to be rebuilt by Americans as a memorial to the American dead in that historic battle.

The Red Cross has developed a disaster census card to be used by relief workers in cases of disaster. "Disaster kits" are now provided all Red Cross division offices and contain all sorts of supplies, record forms, badges, telegraph blanks and other essentials which may be needed in an emergency, for setting up relief headquarters with least possible delay.

A royal decree has been issued in Belgium for the calling of an international congress for the protection of children. The question of establishing an international office for child protection is to be discussed.

The Osage Indians are one of the richest peoples in the world per capita. Recent sales at auction of thirty thousand acres of Indian reservation oil lands near Tulsa for four and one half million dollars plus a bonus of one-sixth of the oil produced was recently approved by the Interior Department.

Since the signing of the armistice a half million women have come into this country.

Chinese railways have free boiling water at each important station. A boiler under a queer-looking circular roof furnishes the water for the making of tea.

Gold is being panned daily near the heart of the north residential district of Los Angeles. The chief engineer for a rock and gravel company operating in the Arroyo Seco, has installed crude sluice boxes and each day "pans" out about $20 worth of gold. The engineer discovered the pay streak when he first entered the employ of the company several months ago and has been panning it since then.

Seven companies control seventy per cent of the total output of anthracite coal in the United States. The remaining thirty per cent comes from mines operated by less than one hundred companies and individuals.

As a tribute to American soldiers who fell in the Great War, a large wreath was officially placed in the American Cemetery at Winchester, England, on Memorial Day.

The cost of producing a ton of hard coal is from two and a half to three times as great as for mining a ton of bituminous coal because the beds are deeper, thinner and generally inclined at steeper angles than those of the soft coal.

A golfer, playing on the Lancaster Country Club course at Lancaster, Ohio, killed a black-snake while striking at the ball just as the snake raised its head from where it lay concealed in the grass.

An army of grasshoppers is advancing on El Paso County, Colorado, from the southwest, destroying virtually all vegetation in its course. The county farm agent says the onslaught of grasshoppers is the largest in the history of that section.

Germany now has four air routes out of Berlin. The longest of these are the Berlin-Dortmund and the Berlin-Koenigsberg routes, each about three hundred miles in length. Other lines are Berlin-Bremen and Berlin-Dresden lines.

Prince William, son of the king of Sweden, has trapped, single-handed, twenty-four gorillas, fourteen lions and many other animals which he is taking to the Stockholm muscum.

Where the new Pacific Highway crosses the Canadian border at Blaine, Washington, a gateway is being erected to commemorate one hundred years without fortifications or armies along the 3,000 miles of international boundary. Inscribed over the doorways are the legends, "Open for 100 Years" and "May These Doors Never Be Closed."

A wealthy Chicago man, the owner of a chain of restaurants which bear his name, has offered one thousand dollars to anyone who will give him one good reason for the private manufacture of revolvers in America and for the use of the United States mails by the manufacturers.

Pickpockets in Chicago are protected by a highly organized trust, who hire criminal lawyers by the year to protect them, according to charges made by the chief of detectives. He states stringent laws in the East are driving the crooks to Chicago, and that it is almost impossible to secure conviction of a pickpocket because of the testimony of their lawyers and their "witnesses" and their ability to obtain bonds at once and escape being identified by their victims.

Two-thirds of the world's gold supply is concentrated in the United States and more is coming in.

It is said that a branch of the I. W. W., with office files and records complete, was organized in the Northumberland, Pennsylvania, county prison. The organizer was sentenced to seven additional months in the prison for his work in connection with the affair.

One unusual effect of the heat in New Jersey recently was the ignition by the sun of guncotton in an arsenal at New Brunswick. A magazine containing three hundred cases of black powder exploded, but no one was injured.

A curious insect of the Malay Peninsula was recently discovered by a member of the London Zoological Society. It is called the lantern-fly and is remarkable for its sudden leaps, made by a curious projection on the front of its head, a kind of creased nose which, when bent back under the abdomen and suddenly released sends the insect flying.

The juices of clover and alfalfa are aiding to destroy the tuberculosis germ, according to the American Institute of Homeopathy. Use of the grass juices has aided in fights against the disease in the treatment of former service men at the Alpine sanatorium. The treatment calls for well-selected food, the utilization of rays, energies and vibrations, and for surroundings of a cheerful nature.

The United States still has fifteen thousand soldiers in Europe, chiefly on the Rhine.

The supreme court of New York has decided that a suit by a young man to recover a ring given during courtship should not be dismissed because of a claim in behalf of the defendant that she was not of age and could not be sued. The court ruled that infancy could not be pleaded as a shield to prevent the return of another's property.

A junior student in Montana State College is the first woman ever to be named as ranger in Yellowstone National Park. It is said she knows every hill and valley and point of interest in the big reserve. She has spent every summer of her life in the park.

Erie Railroad engine drivers, who have achieved a certain standard in the care and handling of their engines, are elected to the Order of the Red Spot and a red spot is placed on the locomotive of the driver. A second degree of the order provides for the substitution of the engineer's name in gold letters for the number plate on his cab.

Twelve homing pigeons were recently released at Edmonton, Alberta, on an eighteen hundred mile flight to San Antonio. This is believed to be one of the longest flights of its kind ever attempted.

Airplanes in their flight to the oil fields of Fort Norman so frightened the Indians that it was with difficulty they could be prevented from shooting at the "devil birds." At one settlement the entire populace took to the woods.

Behind the Veil in Ireland

By ALEXANDER IRVINE

The Irish question is every editor's nightmare. Nothing was ever written about it which failed to bring denunciation from one side or the other. Alex. Irvine, Irish by birth, American by choice, went over to see if he could see it steadily and see it whole. Here is his report. Irvine is a good observer and an honest man. No editor can hope for more.

DUBLIN is the brain center of the Irish movement. I went over there a few weeks ago to find out what men were thinking about. What they do is the result of what they think. I was born in Ireland but I found myself looking at the situation through the eyes of an American. My sympathies were with the Home Rule movement and what I saw confirmed my sympathies in that direction. I had some ideas about violence as a political weapon and they were strengthened in the midst of violence.

I met the extremists at both ends. I talked with men of every phase of opinion. I met the real leaders. They talked freely. I asked questions and the answers were plain and explicit.

"Would an offer of Dominion Home Rule be a basis of negotiation for an armistice or truce?" I asked a member of the I. R. A.*

"We have not been definitely offered anything," he answered.

"But the prime minister has publicly stated that he would meet any representative of the Irish people."

"Yes," he replied, "but we are a nation and he must recognize our government and make terms with our president."

"And if he doesn't?"

"Then the fight goes on!"

The policy of all or nothing permeates all ranks. "The moral supremacy of Sinn Fein is complete," is a phrase I heard a score of times. I spoke of "murder," they didn't like the word. Nobody would concede that to shoot a man dead in his bed or from behind was murder. When I pointed out that the British Government had pardoned the Countess Markevitz and that the I. R. A. had taken Kate Connell out in the middle of the night and killed her without trial, one man replied that the latter was "a damned spy." The man who said that was standing at a window overlooking a Dublin street with a bomb in his hand. He gazed down the street as he spoke. A gun leaned against the wall near the window.

He spoke of reprisals and outrages by the British as sufficient in themselves to justify any sort of killing. When pressed for an instance in which a woman was killed he could only reiterate that the I. R. A. was a regular national army and as such dealt with all spies as the nature of the war demanded.

I was asked scores of times whether in my opinion the United States would recognize the Irish Republic. When I ventured to suggest that such recognition would probably mean war, they said they knew that and were working toward that end. Some men frankly said that reprisals kept the movement alive. It stirred to action their friends and silenced their enemies.

It has been stated in the press many times that Sinn Fein is divided on the policy of violence. I found no such division. I believe from what they told me that Sinn Fein and the I. R. A. are in solid agreement as to the present methods. There are a considerable number of Irish people who deplore and stand out against murder but at present they have no voice in the matter.

The man who was described to me by Sir Horace Plunkett as "the greatest living Irishman" is the poet and dreamer George W. Russell ("A. E."). He is against the policy of violence, so is Sir Horace. So are scores of men and women who were working for Ireland before Mr. DeValera was born. All the men and all the movements living and dead are in hopeless ill repute. "They were corrupted by the English," I was told, and "betrayed Ireland for social recognition in London." Sir Horace Plunkett, after 40 years of constructive service for Ireland, is suspected by both Sinn Fein and the British Government. So is Lady Aberdeen who has done more for Ireland than any other woman. The "no surrender" of Ulster finds its counterpart in "no compromise," in Dublin.

Everybody in Dublin seemed to be in revolt against the curfew, against the military search for arms, and the raids. Yet Dublin does business as usual. The people move freely up and down the streets. Even the armored cars—filled with armed men who sit with their fingers on the triggers—cause little excitement. Every time they pass through the crowded thoroughfares people turn to watch them, not out of mere curiosity but to notice where they fall foul of a bomb.

The popular mind is still mystified about the Black and Tans. Nine out of every ten persons in London or New York do not know the difference between the R. I. C., the Auxiliary Division and the Black and Tans.

When the regular police force of Ireland—the Royal Irish Constabulary—was found inadequate to cope with the situation, it was re-enforced by recruits from England. These recruits were very largely misfits in the social reconstruction. Some of them were desperate characters. Not having enough R. I. C. uniforms to fit them out, they were arrayed in khaki trousers and black R. I. C. tunics. That was soon rectified but the combination gave them the name that still sticks. All the R. I. C. force is now "Black and Tan" in the popular mind.

When it was necessary still further to reinforce the police power, the Auxiliary Division, composed entirely of ex-army officers, was organized. In the beginning of this force there were desperate characters also and outrages were committed. The regular army is quite distinct from all of these. Outrage, violence and murder by men in rebellion are reprehensible in any civilized community but at their worst they are not quite so reprehensible as acts of the same nature done by the agents of the state

who are charged with the responsibility of enforcing the law.

I am convinced that the psychological origin of violence by the armed forces of the crown can be traced to the mental attitude of one man. That man is General Tudor. He commands the R. I. C. and the Auxiliary Division. He went to Ireland determined to carry out the policy of the mailed fist and he did it ruthlessly. What he is quoted as saying about the Irish as a race is not fit to print. His policy failed. He is hated bitterly by both friends and enemies. By friends, I mean the men under his command. How much the British Government was cognizant of his mental attitude or how far it was responsible for his acts I do not know. I do know that one general under him resigned and the man who succeeded him refused to carry out a policy of ruthlessness. I also know that he is living because he is the best-guarded man in Ireland.

General E. A. Wood is the new commander of the Auxiliary Division. I was with him in France and knew him to be one of the finest men who ever wore uniform. Four times in France he won the Distinguished Service Order. After sensing the situation in Dublin I called on him at Beggar's Bush barracks and asked permission to accompany him through the disturbed areas.

"If you'll take pot-luck in pot shots, come along," he said. He had made that offer to many men before but I was the only man who ever accepted the invitation. He rides in an open car. He never carries a revolver. I cannot say I was particularly enthusiastic, for Ireland is not France. In the latter bullets came from one direction. In Ireland they come from all directions.

So off we went through Lengford, Leitrim, Roscommon and Sligo. In front of the general went a very powerful car—a 70-mile-an-hour arrangement—with machine guns and armed men. Behind us were two armored cars. There were times when this armored train crept along at a mile an hour clip, for the roads were ripped up, huge piles of stones lay in the road and at times great giant trees lay across our path.

In one afternoon the stage was all set for an ambush, nine times, but not a shot was fired. We saw the men of the I. R. A. on the hilltops but we looked too formidable to engage.

Every time we were held up, the soldiers got out of the cars and rifles in hand spread out like a fan for action. Farm houses in the vicinity were visited and the men found therein were brought to the scene. Once when we were up against a huge stone wall across the road—four feet high and as many in width, a farmer was brought to the scene.

"When did you do this?" asked the general.

"Oi dunno," said the man, intentionally or unintentionally evading the personal allusion.

"How long has it been here?" was the next question.

"A month, maybe more," was the Irishman's reply as he looked the general straight in the eyes. The general smiled incredulously. We were all of one opinion—to wit, that the man was lying. He lived a few hundred yards away and must have known. The pile looked quite new.

"Come, come!" urged the general, "let's have it. Have these stones been here three days or four?"

"A month, oi towld ye," said the man in a tone of mild impatience.

"Very well," said the general to a subordinate, "gather all the men in the region and make them clear them away at once." The man turned to the pile and began to remove the boulders. Several of us started to help at the same time.

Suddenly a Willy-Wag-Tail fluttered from the stone pile. We looked at the spot and found a nest with five eggs in it. We looked at each other, then at the farmer. He was working. We were thinking.

"He was telling the truth," said a Dublin Castle official. We agreed. There was no doubt of that. There in front of us lay the evidence in the case.

"They must have been here a month," said an officer to the man.

"Oh, indade yer roight, sor," said he. "Faith, she'd be afther takin' a month t' lay thim!" and he went on with the work—unconcerned.

At each headquarters of a company the general received reports, inspected the men and addressed them. His address was brief and to the point. "When you are in a fight with these men," he would say, "you will fight as you fought in France. When you are not in a fight you will remember that we are not here to fight the Irish people but to restore law and order. Only as a last resort will you appeal to force or respond to it in defense. Most of these people are as law-abiding as our own folks at home. Respect their religion and their customs and their wives and property. The provocation is terrific, the temptations are great, but you must not give way."

And privately he let it be known that even well-grounded suspicion would be enough to have a man dismissed instantly from the force.

Wherever I went I interviewed the townspeople—I wanted their point of view. In the early stages of this, extra police force outrages had been committed upon the people—the general told me that some of them were "damnable." In every town I visited the cadets—who are the privates in the Auxiliary force—walked the streets freely, just as they did in France, with the girls of the town. There were times when the girls were forbidden to meet them or to attend dances. They were told that their hair would be cut off but they went just the same.

There were instances where the men of the army were shot dead but as a whole the regular British army was popular all over Ireland.

"If you don't believe that," said an I. R. A. man to me, "go to the race course and observe." I did, and at the Phoenix Park races the Tommies mingled with the civilians quite plentifully and freely. But not a single policeman of any sort could be seen on the course.

I witnessed a round-up. I hate the words but that is what the thing was called. An area, a center of trouble, was selected. The cavalry encircled it on horseback—horses can leap ditches and get over plowed fields—and the infantry manned the roads. From the outer rim the cavalry closed in toward the center, bringing with them from farms and villages all men suspected and that seemed to be the entire male population.

There was no escape from this iron ring. As men were caught they gave up their guns and were driven toward the center—in this case the village of Mayvore. The operation seemed like the drawing in of a great net. It was a soldier's job. None of the Auxiliaries nor R. I. C. were engaged. The colonel in charge was Colonel Cavendish, of the same family as that other Cavendish whose murder in Phoenix Park shocked Europe a generation ago.

I saw the results. Sixty-seven Irishmen were lined up against a white wall in the village. They were dishevelled, many of them had no hats, no collars. They were silent and watched in a listless vacant way what was going on.

A strange emotion swept over me. I had a terrific struggle to keep back tears! General Wood too was silent until we passed on, then he said: "What an awful business for civilized men to be engaged in!"

We had tea with the colonel. It was a successful round-up. He was pleased, happy, and his happiness gave me more pain than the sight of the men against the white wall.

The leader of the I. R. A. in the Boyle region of Roscommon is Jim Hunt. Jim was a footballer of national fame. He was formerly a member of the R. I. C. Here is what Jim wrote to the man in command of the Auxiliary company at Boyle:

"Dear Sir:

"We now throw down the challenge for you to meet us in an open fight under the following conditions: An equal number of men, from 30 to 60. Similar weapons, rifles preferred, and an equal amount of ammunition. Ground to be prearranged by a neutral referee. If you win, we surrender and give up the fight in this area. If we win you are to evacuate this area and not enter it except by permit granted by the republican army. Trusting you will favor me with an early reply accepting the challenge:

"Signed,

"On behalf of the men on the run."

The C. O. of another Auxiliary company issued a similar challenge to the I. R. A. of the region. Neither of the challenges was accepted. Here, however, is the authentic story of a challenge that was accepted and fought to a finish. I got the story from one of the principals in the fight.

A group of about ten cadets rounded up as many men on the run in a mountainous region, and having them completely overpowered, issued a challenge to fisticuffs.

"Throw down your guns!" said an Irishman. Guns were downed and belts discarded. Two fights were arranged. In the first fight the Irishman was knocked out. He had caught a Tartar—a heavyweight who was not unfamiliar with the prize ring. In the second encounter the Englishman was half killed and the score was even. Then the forces of the crown buckled on their belts and took the Irishmen to the nearest saloon where they treated them to their national beverage, shook hands with them and sent them back to the hills. There is no gall of bitterness in that region now.

It is difficult to be neutral on the Irish problem. I was born in Ireland but I went back with an American mind. At least I had no bias. I had no axe to grind.

As I had asked men on the run to give me their philosophy of murder—so I asked soldiers to explain to me the psychology of reprisals.

"It is the policy of whatever government we have in Ireland," said one man who had himself executed such orders. He told me the names of a score of men who had been shot dead in their beds. Some of them were his personal friends. "Even the Germans never waged war like that," he said. I corrected him on that. The Germans did when they got a chance but that did not make it right in Ireland.

"We know," said a high official, "that reprisals have saved life and we do it not for revenge but as a deterrent and it deters." He had a friend. One night in Dublin three armed men entered his bedroom. "Don't shoot me beside my wife," begged the man. He repeated the language of the armed men. They did shoot him beside his wife and the act embittered many men. There was a tinge of it in this man.

"Do you know what is meant by the punishment of Abelard?" asked this officer. Yes, I did. "Well, that's the sort of hellish fiendishness that these murderers have inflicted on some of our comrades before death relieved them!"

As I sat in General Wood's office on the day of our return the door opened, an officer clicked his heels and saluted. "May I borrow your car for 30 minutes, sir?"

"Yes—what for?"

"The hospital patients must be armed at once, sir!"

"Go ahead!"

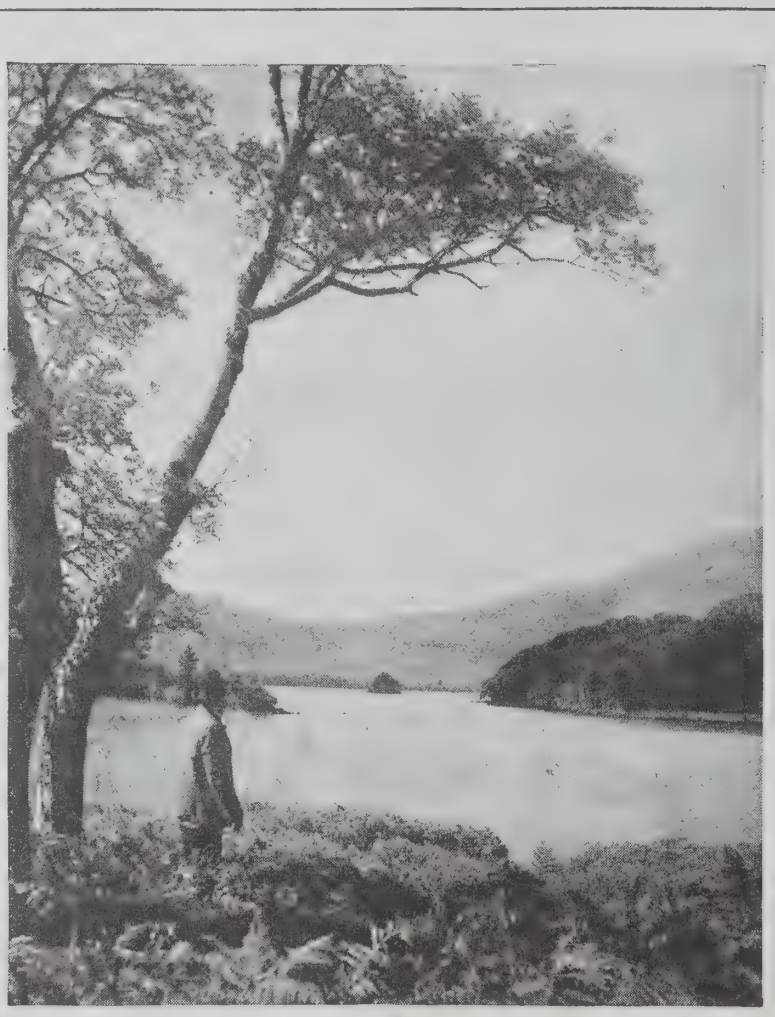
"They drag our wounded men out of their beds and shoot them like dogs," said General Wood, "and nothing that happens here is quite as provoking to our men." Anger creates anger, outrage creates outrage and force creates force. It matters little who begins it—what matters is who will end it.

The most striking thing in Ireland is the bankruptcy of religion. The thing does not exist. The politico-theological aspects are quite alive.

In no country on earth is there such chaos of authority as in Ireland. No one over there can tell you what relation the lord lieutenant bears to the British cabinet or what relation the chief secretary bears to the lord lieutenant. General McCready commands the regular army but they have no relation whatever with the forces under the command of General Tudor. Chaos at the top means chaos at the bottom and all the way through.

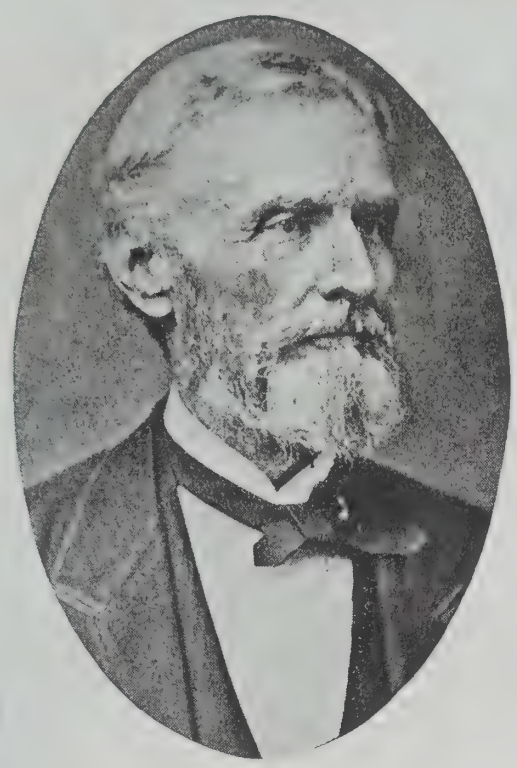
"Well," said a member of the British Government to me, "what would you do?"

"If your House of Commons could believe in God for one afternoon," I replied, "they would settle the Irish question over night!"



"How?"

"Part of that belief would be a supreme act of faith in the Irish people and part of that would compel you to remove the army and police and trust the people!"



He smiled a little and I asked him what would happen if they did that and he frankly told me. It was his belief that if the government did that the Unionists would march out en masse!

"And that," said I, "would be the end of the Coalition!"

"Yes!"

Devil's Island, Killarney

JEFFERSON DAVIS

This photograph, never before published, was taken in Montgomery, in 1885.

Preserving First White House of the Confederacy

By JOHN TIPPEN

"I WAS inaugurated on Monday; the audience was large and brilliant. Upon my weary heart were showered smiles, plaudits and flowers. But beyond them I saw troubles and thorns innumerable. Yet I do not despond, and will not shrink from the task imposed upon me. I thought it would have gratified you to have witnessed it, and have been a memory to our children. Thus, I constantly wish to have you all with me. As soon as an hour is my own I shall look for a house and write you more fully."

These lines were contained in a letter to Mrs. Jefferson Davis written February 20, 1861, two days after the inauguration of her husband as president of the Confederate States of America at the capitol in Montgomery. Jefferson Davis, hero of the hour, president of a new republic, statesman and soldier, was still the husband and father, longing for some haven of refuge from the cruel hour which the war must bring. He desired a home. He wanted his family by his side.

And by diligent search, he found a suitable house—the first White House of the Confederacy.

On March 4, 1861, a great steamboat came proudly plowing her way around the curves of the majestic Alabama. The mellow notes from her whistle mingled with the martial music of the caliope, quickening the heart of a waiting president—a loving husband, a proud father.

The old landing at Montgomery has never known a gladder meeting than that which followed the coming of Varina Howell Davis to comfort and smooth, as best she could, the pathway of him whose far-sighted vision had already told her would be a thorny road.

It was on this same memorable Monday that the first flag of the Confederacy had been flung to the breeze—raised by Miss Letitia Tyler, grand-daughter of former President Tyler—while "ten thousand hailed it gladly, and ten thousand wildly, madly, swore it should forever wave."

And Mrs. Davis was well pleased with her new home. It was, she said, a "gentleman's residence, roomy enough for our purpose."

The old mansion had formerly been the "handsome" home of Colonel Edmund Harrison, located at the corner of South Washington (now Lee) and Bibb streets. It was built by William Sayre. In 1825 Mr. Sayre entertained LaFayette in this house. It was from there that a sofa was sent to Bell Tavern, corner of Commerce and Tallapoosa streets, for LaFayette's comfort during a ball given in his honor. This sofa is now owned by Mrs. Westwood Sayre, of Memphis, Tennessee.

Mr. Sayre sold the house to William Knox, who disposed of it to George Mathews. Fleming Freeman was the next owner. Then it was transferred to Colonel Joseph S. Winter, who remodelled it and sold it to a Mr. Calloway. At the outbreak of the Civil War Colonel Edmund Harrison was the owner; then it passed on to William Crawford Bibb and later to Archibald Tyson, of Lowndesboro, Alabama. On November 8, 1873, Mrs. R. L. Render, of LaGrange, Georgia, daughter of Mr. Tyson, inherited the property for her natural lifetime on the death of her father. At her death, on May 6, 1918, her heirs, Miss Eulah Render, Mrs. Bettie Render Morgan, and R. L. Render, of LaGrange, Georgia, and Mrs. Robert Ridley, of Atlanta, came into possession of the property.

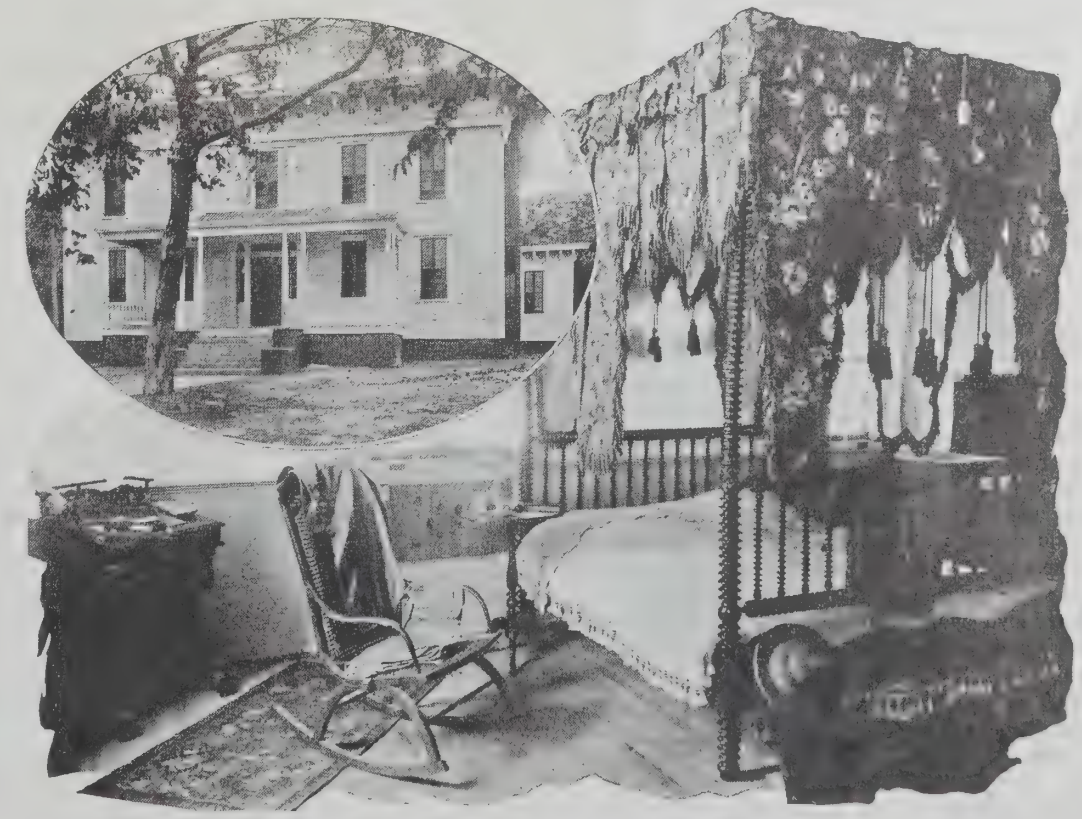
But none of these owners were as proud of their possession as are the present owners of the first White House of the Confederacy—the women of Alabama and the South.

The beaux and belles of Montgomery after the war, as well as the brilliant men and women of the sixties, spent many happy hours in the White House, but none of them were so happy as are the women who have carried on a continuous struggle for twenty-four years for the preservation of the historic old building. For on June 3, amid scenes which rivalled those of the inauguration of Jefferson Davis, or the arrival of Mrs. Davis, the first White House of the Confederacy was dedicated at Montgomery as a southern shrine.

The story of the struggle for the preservation of the first White House is one of compelling interest. Twice the women of the First White House Association succeeded in securing passage by the state legislature of bills making appropriations for the purchase of the building and the site, but the measures were vetoed by the governors in each instance. Undaunted, the women refused to give up. They toiled ceaselessly and saved money. During the Alabama constitutional convention of 1901 they cooked lunches and served them in the rotunda of the capitol to add money to their treasury.

The third White House appropriation bill was passed by the legislature of 1919. It required hard work on the part of the members of the White House Association. It took tears, tact, sacrifice and courage. At times the task seemed almost hopeless, and spirits less brave undoubtedly would have given up the fight. But the women of Alabama stuck to the job. Finally, an appropriation for the purchase of a site for the building was passed. Governor Thomas E. Kilby signed the bill. With money raised by their own efforts to purchase the building, the passage of this measure providing funds for the site assured the preservation of the White House.

The struggle for saving the first White House for the South was begun in 1897, with the organization of the Alabama Division of the United Daughters of the Confederacy. Some years later opposition to the proposal developed among the members of the organization. Growing weary of trying to keep up the work in the United Daughters of the Confederacy, friends of the movement gave up the effort and formed the First White House Association, with Mrs. Jefferson Davis, queen regent and Mrs. J. D. Beale, regent. The office of queen regent expired with the death of Mrs. Davis and other officers were elected from time to time. Mrs. Chappell Cory, of Birmingham, is the present regent of the association.



A charter was granted the First White House Association by the Alabama legislature on February 5, 1901.

Among the most valued relics preserved in the first White House are those presented the White House Association by Mrs. Jefferson Davis. They consist of furniture from Beauvoir, last used by Mr. Davis; his historic sword, chairs, bureaus; the table upon which he wrote "The Rise and Fall of the Confederacy"; valuable books used by himself and his daughter, Winnie Davis; bric-a-brac, vases and other articles.

These articles, prior to the purchase of the White House, reposed in the Jefferson Davis room of the state capitol. It was in January, 1919, that the White House Association was informed that due to the crowded condition of the capitol the articles would have to be removed. With aching hearts the women wrapped each sacred relic carefully and carefully laid it away in the basement of the capitol. Some thought this meant the death of the movement for the preservation of the White House, but it was actually the forerunner of the success of a movement which had been carried on for almost a quarter of a century.

In the meantime workmen began excavating on the corner lot next to the White House. It was reported that the building was to be demolished to make way for a garage. Something must be done or the White House was doomed. The White House Association sent an envoy to the owners of the building. When she returned the papers had been signed. The White House had been purchased, but the owner refused to sell the lot. The building would have to be moved, quickly. With tears and pleadings the legislature was induced to make an appropriation for a site. Victory was won.

A commission was appointed to select the grounds, and the first White House of the Confederacy now stands on a hill facing the state capitol, where Jefferson Davis took the oath as president of the Confederacy. In its restoration it is beautiful and complete—a memorial to President Davis and to the women of the South who worked twenty-four years to save it. It has been dedicated as a southern shrine, and in the future will house the sacred relics of the state and the South.

Jefferson Davis' room in the first White House. The furnishings of the room were presented to the First White House Association by Mrs. Jefferson Davis before her death. They have been arranged just as they were when Mr. Davis occupied the room. Insert—The First White House of the Confederacy, the home of Jefferson Davis in Montgomery. The building has been purchased by the women of the South and dedicated as a southern shrine. It houses numerous relics of the state and the South.

Judged by Its Fruits

ALL reports agree that the representatives of the British Overseas Dominions at the Imperial Council in London are at heart and unanimously opposed to a renewal of the Anglo-Japanese pact. The chief reason for this attitude is represented to be an aversion to facing the possibility of Britain being lined up against the United States, should we become involved in a war with Japan. Recognizing this feeling, the British premier has definitely announced a desire to co-operate fully with the United States in the matter of foreign policy affecting the Pacific. Several leading colonial premiers and London newspapers go as far as to suggest that the new treaty should not be signed until it has received American approval.

This friendly anxiety to please the United States is certainly flattering to our national pride in the manner of its expression; but the question is, how about the matter of it?

Soon after the signing of the Treaty of Versailles, it was officially announced that the Tokio Government would not seek a second renewal of the Anglo-Japanese pact of 1902 (renewed on June 13, 1911, for a period of ten years), because its provisions are obviously inconsistent with the Versailles pact. In this view, it was said, the British Government concurred. The whole matter was gone into at the peace table in Paris and it was generally assumed at the time that the Versailles Treaty practically abrogated the Anglo-Japanese pact by making it superfluous.

It is certainly a mistake to attribute dominion opposition wholly to concern for the United States. The dominions do not lack lively sense of their own interests. Both in Australia and in Canada, especially on Canada's Pacific coast, there has been a steadily growing feeling, during recent years, that their interests were seriously menaced by the growth of Japanese imperialism. This growth, as the facts show plainly, has been stimulated and strengthened by the alliance that bound Britain to the support of Japanese policies in the East. Glaringly and persistently, Japanese policy has been and still is opposed to the American policy of the Open Door and Chinese territorial integrity.

A tree should be judged by its fruits. By this criterion the Anglo-Japanese pact stands condemned. It has been responsible for the dictation at the cannon's mouth of the 21 articles that virtually reduced the Republic of China to the condition of a Japanese vassal fief. The seizure of Korea and the ruthless reduction of its inhabitants to Japanese rule and subjection; the occupation of Eastern Siberia and the scheming patently aimed at the acquisition of that rich northern empire; the partitioning of China by the stealing of Shantung, and, lastly, the cavalier flouting of international cable-rights in the Island of Yap, in violation of solemnly assumed treaty obligations; all these things are among the most obvious fruits of a treaty that holds the might and prestige of the British Empire to the bolstering up of Japanese imperial expansion.

If Mr. Lloyd George really wants to please the United States, and at the same time to please the great democratic British dominions, he will let the Anglo-Japanese Treaty die a natural death. However friendly and cordial the sentiments expressed toward the United States, such a treaty cannot be otherwise than disquieting. Every alliance is one between the contracting parties and against some third party. At the present time, an Anglo-Japanese alliance is an alliance against the United States and—the self-governing British dominions. It cannot be otherwise and no amount of casuistry should blind us to this fact.

And not only in Canada, Australia, New Zealand and South Africa is there distinct repugnance to committing England to the defense of Japanese aggression in the Far East. The sentiment is one that is largely shared in England itself by the more thoughtful men in both Liberal and Unionist ranks, while the formidable Labor party, which already holds the balance of power, is solidly against what it regards as "an unnatural alliance."

Up the Hill and Down Again

CONGRESS seems to be exemplifying the old nursery rhyme:

"There was a King of France who had ten thousand men;
He marched them up the hill and then marched them down again."

First the Senate passes the naval appropriation after putting on an extra $100,000,000, making it something more than $500,000,000. Then the House lops off the extra hundred millions. At the same time the House adds 25,000 men to the strength of the Army; but the Senate takes its whack at the bill and slices the 25,000 men off again.

In all this see-sawing the one hopeful feature has been the realization of both houses that the country is in no mood for any further fooling with the Borah amendment calling for a disarmament conference.

As between Senate naval appropriations footing up $500,000,000 and the $400,000,000 for which the House is putting up a spectacular fight, the difference is that between tweedledum and tweedledee. The largest items in the bill are battleships at fifty millions apiece—battleships which a disarmament conference would probably make altogether unnecessary and which, in any event, are likely to become obsolete before they are launched.

Taking this into account, the taxpayers of the country may well feel that an appropriation of even $150,000,000 would be excessive. At a time when there is need and demand for the strictest economy, Congress votes appropriations as if the public purse were inexhaustible.

The people will not forever continue to be fooled by the farce of tax-wasters asking impossible sums through the Senate and then getting the House to vote only less preposterous sums. It is a little too suggestive of the huckster that asks an absurdly high price for a suit of second-hand clothes in order to make a virtue of letting himself be "cut down"—to a still excessive price.

The Foster Memorial

THE news that it is proposed to raise $50,000 for a memorial on the Bowery in New York to Stephen Collins Foster will bring up many bittersweet memories to those of us for whom the old melodies of the author of "Old Folks at Home," "Swanee River," "Nelly Gray," and a hundred other of his songs continue to hold charm. Of all the songs of this popular composer of a generation gone, perhaps none had more "heart interest" than "Hard Times Come Again No More." In the years following the war, a great many people knew well what hard times meant. The song made deep appeal to thousands.

It was a song that stirred the heart because it came from the heart. Foster himself had known hard times. It was on the Bowery that he spent the last few of his ill-rewarded years. Out of a shabby little lodging-house room on that thoroughfare, he carried scores of his melodies to be sold for the pittance that would buy needed bread. But out of his hard times, he surpassed all the present-day Judaic "artists" who know such very soft times. Fortunes are obtained from a single "popular" song today, while Foster, whose songs will live on and on long after the latest vaudeville or jazz favorite of today is forgotten, was allowed to starve. With wise old Fletcher of Saltoun, he could say: "Let me but make the songs of a people and I care not who makes their laws." His reward is more than money.

There is something fitting, something that would appeal to the gentle soul of Foster himself, in the fact that the memorial in his honor is not to take shape in marble, granite or bronze, but is to constitute a living fund that will, through coming years, afford saving help to men and women with whom "hard times" is a matter of daily experience. The income of the fund is to be used to support a bread line under the direction of the Bowery Mission—and it could not be under better supervision.

If every lover of Foster's songs in America were to contribute one dollar to the fund, it would be subscribed many times over. If the copyrights were in force, the royalties in a single month would exceed the entire sum needed. For many a "down-and-outer" on the Bowery, that bread line will mean the difference between going to bed fed and going to bed hungry. And that, in turn, may mean a tiding over to a place where hard times shall come again no more.

The International High Court

ONE of the greatest difficulties that perplexed the commission of jurists charged with drawing up the framework of the Permanent Court of International Justice provided for in the Covenant of the League of Nations was the selection of the judges. An idea advanced by Elihu Root, American Commissioner, was adopted as a happy solution of the problem. It was, in effect, that the nations' representatives in the old Hague Tribunal should be asked to make nominations to be acted upon at the next meeting of the Council and the Assembly of the League in September.

In accordance with this arrangement, Elihu Root, John Bassett Moore, Judge George Gray and Oscar S. Straus, our present arbitrators in the Hague Court, have been asked by the Council of the League to submit the names of four persons, no more than two of whom shall be Americans, as candidates for election as judges of the new court.

In view of President Harding's scrapping of the League and all its works by the voice of his accredited representative in the Supreme Inter-Allied Council, it may well be asked: What are these eminent American jurists going to do about it?

One of several courses is open to them. Bowing to Colonel Harvey's pronunciamento, they may simply ignore the existence of the League of Nations, despite the fact that 42 sovereign states are already enrolled and acting in its membership. Or, as jurists, regardless of nationality and of national policies, recognizing an accomplished fact and fulfilling a duty laid on all four as members of the Hague Tribunal, they may comply with the request of the Council of the League.

If they should name four foreigners, they might avoid embarrassing President Harding. He would possibly regard the participation of Americans in the International Court as inconsistent with his policy, as announced by his ambassador in London. Yet there is probably no law to prevent the acceptance by Americans of an election to the bench of the Permanent Court of International Justice. Americans are not ineligible to that high office.

Let's wait and see!

Wanted: a Way-shower

THE one note dominant in the flood of recent commencement oratory is a pessimistic conviction that things are in a bad way and that our reliance on the product of the universities to lead the way out is a parlous hope.

President Lowell of Harvard emphasizes the need of more thought, rather than more organization or machinery. He feels that clear, illumined and unbiased thought should be as widespread among our people as possible, "for in the multitude of the wise is the welfare of the world."

That last has an oracular sound. It suggests a question. Is there no longer wisdom either among the multitude or the educated elite? President Lowell in this connection re-echoes the familiar condemnations of the unthinking impulse to follow the crowd and its clamor, instead of every man thinking for himself. There is timeliness in his reminder that "the art of producing the semblance of a public opinion by a general shout has progressed greatly within a generation." But man is a thinking animal, after all. Why are thinkers now so rare?

Another more optimistic baccalaureate speaker declares that hundreds of thousands of men would be found ready to live and work for an idea, if only one should show the way, as four years ago they were ready to die for an idea.

Wherever thoughtful men come together in serious conversation one hears a wail over the paucity of our age in leadership. Opportunists, politicians, time-servers, clever poseurs there are a-plenty. But it would be difficult to name, in either church or state, a leader of the old-time qualities; one inspiring in the crowd any passionate devotion to an ideal and full consecration to the work of its actualization. Where is the Jefferson or the Hamilton, the Lincoln, the Webster, the Sumner, the Lloyd Garrison or Wendell Phillips, the Garibaldi or Mazzini, the Wesley, the Beecher, or the Roosevelt of our time? Where is the leader whom the common people follow gladly?

Perhaps we lack leaders because we lack thinkers, lack ideas. Perhaps, in the last analysis, we lack leaders because we lack men and women endowed with the divine gift of being good followers. An appreciative audience has much to do with the success of a speaker or singer or actor. An orchestral leader is important, but he can do little without men who contain within themselves the makings of a good orchestra. We need a way-shower, it may be. It is certain that we need people willing to be shown the way and to take big chances for a big idea. Even a Garibaldi or a Lincoln would fail lacking a people who cared little for such dreams as Human Freedom and Human Unity.

Mr. Ford's Page

THE word "bonus" is frequently heard these days in connection with the men who fought for our country in the Great War. And wherever it is heard, there will be found two opinions upon it. Perhaps everybody, those who are for it and those who are against it, feels that at best it is a makeshift, that the granting of a bonus will not do much for the soldier after all, and that it will constitute no *permanent* good for him. The principal element is the spiritual: to refuse the bonus is felt to be ingratitude, and this is to be avoided as an evil spirit. But at the same time no one will be found to say that to grant the bonus, a mere $10 or $15 for every month of service, is an adequate show of gratitude. It doesn't discharge the debt. Heaven help us if we measure our gratitude to our soldiers by the amount of any bonus.

So there are the two points: the bonus pays nothing. It is a small and temporary aid to men who may be in need of ready money by reason of unemployment, but who would prefer a return of their rightful work in the world to anything else we could do for them.

The American Soldier, the boy who left shop and store and office and school, taking a year or two out of his life to settle the military question overseas, should not be placed in a false light in all this discussion. He is not asking for charity. He would not take charity. He should not be used in argument or plea as if he were asking or expecting charity.

But he has a right to expect that after having done what we asked him to do, we shall give him the opportunity to regain the place he left, and shall leave nothing wanting in our effort to restore him to the same degree of competence which he had before.

That is one of the really black blots on our whole war organization. We had a splendid organization for the handling of copper, for example. We had many men ready to leap in and offer their services where it was a matter of rounding up war supplies. Our war government, with its price fixers and its general manipulators of "understandings" here and there, was certainly an amazing institution. But when it came to cleaning up the ruck and riot of war, there wasn't one to help. They had all resigned. There is no profit in teaching a blind soldier a trade. There is no profit in helping to salvage the human wreckage of the war. There is no profit in taking the armless and the legless and the shell-shocked and helping to restore them again. And so our famous "war government" is not on the job. It is out looking for other worlds to conquer. And about the only thing we hear is complaints about the mistakes and lacks of the restorative program, and urges for the bonus.

The soldier has a right to complain, although to his credit be it said that he is not complaining for himself so much as for his wounded "buddy" who isn't getting the chance he ought to have. And he also has a right to reflect that the so-called "bonus" is a mighty little thing after all.

In one state where it is proposed to pay the soldiers a bonus, no soldier will receive more than $300, yet the state will expend about $30,000,000 in paying the amounts, and an additional $54,000,000 for interest on the bonds which it had to issue in order to raise the bonus money. There is the matter of $150 to $300 for the soldier, and a matter of $54,000,000 for the money-lenders. Indeed, whatever bonus the soldier gets, he will pay for over and over again in his taxes.

Now, if the people of that state should go down into their pockets and by a self-imposed assessment of about $10 a head, raise a fund to present to their soldiers as a special gift to tide them over a tough time, there would be something tremendously human and moving about that. But the trouble is that bonuses have not even that much sentiment. They are first politics, then they are debts, and the only people who really benefit are the money-lenders. They get their "bonus" regularly for 30 years afterward.

If a bonus, no matter how small it was, came as a wreath of victory; if it were really the conscious act of the people in showing their appreciation, that would be quite another thing. But all it amounts to nowadays is the sale of interest-bearing bonds.

If a state really wants to do something for the soldiers, *why does it not give them the interest?* If the state would arrange to give the soldiers the *interest* on the projected bonus loans, the soldiers would get nearly *twice as much,* and the state would save the entire principal.

To give its soldiers $30,000,000 the state in question is going to give the money-lenders $54,000,000; a total of $84,000,000 in all to finance the giving away of $30,000,000. If the state would give its soldiers the interest, $54,000,000, it would save the principal, or $30,000,000. And the soldiers would get nearly twice as much.

If a state can pay interest to the banks, it can pay interest to the men it ought to help.

Now, the soldier himself does not regard our system as a very good one, when it works out that way. He is not impressed with the wisdom of a system that mortgages a state for 30 years in a great sum, and still doesn't do much for the soldier.

If the bonus really set the soldier up for life, if it established him in his place as a professional man, commercial man, mechanic or farmer, if the bonus settled anything at all, it might be worth any state's effort to do it.

But what does a scrawny $150 to $300 do for a man? It is totally inadequate as a testimonial of the state's gratitude; it is totally inadequate to the establishment of the soldier in his place in the world.

When you give a soldier $300 and a banker $540 interest for the privilege, it would seem much wiser as well as much kinder to give the soldier the $540 interest and save the $300, thus costing the state only $240 when measured by the other plan. And, if the state wanted to go as far as it goes under the bond plan, let the soldier have the $300 and the $540 too, $840, and let the state pay both interest and principal to herself.

The best bonus that can be given the soldier is a place to work where he can snap his finger at bonuses, and a state to live in where the money-lenders have not the deciding voice about everything.

Money is the least valuable of all the commodities, yet it brings the highest price; and though we have the manufacture of it in our own hands as a nation, yet it is the scarcest of all the things we make. The controllers of money were able to smooth the way for the soldier when they wanted him to fight; they seem strangely helpless to smooth the way for him now that he only wants to work.

There is doubtless a duty and a debt to those who, in response to our call, suffered loss, of whatever kind the loss may be. Certainly there is an element of fairness in the consideration that the man who staid home and had a year or two advantage over the man who went, should not thus put the soldier at a disadvantage The breaks of war were many; they must be repaired where possible; many of the breaks can never be repaired. But can it be done in this slip-shod, half-hearted borrowing which profits nobody but the lender? If a state desires to give its soldiers $30,000,000, let it tax its people for that amount, instead of taxing its people for $84,000,000 in order to expend $30,000,000.

The soldier himself would be of that opinion.

THE soldier's bonus may help him out temporarily, but will not establish him for life, nor even give him a good start. In one state it is planned to give the soldier $150 to $300, but bonds must be issued which will pay the money-lenders 180 per cent of what the soldier gets. If the interest were paid the soldiers, they would get almost twice as much as they will get now. The bonus system is politics and debt; it doesn't discharge our debt to the soldier, and it is a very inadequate expression of our gratitude. What the soldier asks is a chance to snap his fingers at bonuses. He wants a chance to get back where he was. Who is helping him do that?

The Study-What-You-Want School of Denver

Where Everyone From 14 to 70 Learns Just What He Needs; Thousands Finding Gates of Opportunity Again Opened to Them

By R. P. CRAWFORD

OUT in Denver it is known by the dignified name of Opportunity school, but I prefer to call it the "Study-What-You-Want" school. For, unlike any other school in the world, young people and old people, and those in between, come and go from eight in the morning to nine-thirty at night, studying whatever they want to know. Men who long ago thought the doors of Opportunity closed to them have taken a new lease on life. Boys and girls who had been forced to become breadwinners at tender years receive the schooling which other city schools had forgotten to give. Last year, almost in a ceaseless stream, more than 7,000 persons from 14 to 70 years of age, and from all stations in life, passed through this remarkable institution receiving that learning which Fate apparently had decreed they should not have.

If one has a little time to spare, it is only a few blocks walk from the heart of the Denver business district. The gaunt red brick structure, one of the oldest school buildings in Denver, was once the pride of Denver's best residence section before the days of Capitol Hill. Upon entering this school almost the very first person that one meets is Miss Emily Griffith, the principal. Miss Griffith is just as different from most principals of schools as this school is different from other schools. She has her office right out in the open on the first floor. It is no effort to see the "princpul." It is the pride of this school that there is probably hardly a single student who does not feel that he knows Miss Griffith personally.

It was Miss Griffith who originated the unique plan of this school. She saw that there were thousands of boys and girls, men and women, the city over that needed some one line of practical instruction, either to help them in their daily work or to make life more attractive in a social way. Miss Griffith had been principal of a night school and so she went to Mr. Carlos M. Cole, then superintendent of schools, with the proposition that the night school be kept open in the daytime as well.

The Opportunity school is a school that runs strictly on its own merits. There is no compulsory attendance for the thousands who take work every year. They study because they see the advantage in doing so. The employment department of the school placed 1,000 persons in positions in three months.

There is almost every kind of course in this school, and if the school has not the kind of course that the pupil wants, one is manufactured for him. For instance, more than one person has come to the school for the specific purpose of learning how to behave in society. One man came to the school with the announcement that he was being considered for a promotion in his company where he would have to entertain guests at a big hotel. That night he was to be tried out. Miss Griffith promptly arranged a model banquet in the basement of the school, where he learned all the niceties of banqueting from the right forks and spoons to a line of small talk. And what is more, he made such a good impression at the Brown Palace hotel that evening that he landed the new job.

Above—A banquet at the Denver Opportunity school. Every one of these young men is looking forward to doing bigger things in the future. Below—The Denver Opportunity school, which operates day and night and where one may study anything he pleases. Pupils come and go all the time, taking a few hours work each day.

Another man had just arrived in Denver from a small town. Having some acquaintance of social pretentions, he desired to call on them. But he was completely mystified by the system of telephones and speaking tubes in the apartment houses. Miss Griffith arranged a practical demonstration at the home of one of her friends. The man was completely straightened out and went on his way rejoicing.

A similar case was that of a woman who had just broken into society. The school never learned her name—in fact, they never asked—but she wanted a course in social etiquette. It was only necessary to tell her in private the things that she wanted to know. Later she was able to discriminate with such nicety in social functions that she pronounced one function "Nothing but a feed."

In your own home town, just what would you do if you wanted to know such things? Most likely, you would pick up the information as best you could, and perhaps be mortified several times in the attempt. But these isolated cases just show the length to which this human school goes in its efforts to satisfy the demand for practical knowledge on the part of the common people—to which class nine-tenths of us belong.

The school has instituted courses of the most practical nature. They include such subjects as machine shop work, drafting, all of the commercial courses, oxy-acetylene welding, millinery, domestic science, telegraphy, show card printing, applied electricity, sheet metal work, automobile repairing—and what not. One can even study to be a beauty parlor expert—and don't laugh at this, either, for some of those taking work in this department hold exceedingly fine positions. The millinery course is not just a few hints on hat-trimming, but it enables those who finish it to run shops of their own. More than one student has done this very thing, and on such occasions the millinery expert from the school looks after all the details of stocking up the shop to furnishing the student with a big exhibit for the opening day.

The great majority of the students are those who contemplate a change in occupation. Ordinarily changing occupations, where one has no special training and no money saved up, is almost impossible, but the Opportunity school through its study-what-you-want courses takes care of the student. Many business houses will permit an employe to have a few hours off during the daytime to study at the Opportunity school, or he can study evenings. There is always a way found to help people.

This city school does not aim to turn out world celebrities, but it does aim to help thousands of common ordinary people to make their lives more successful. One day a girl, penniless and with practically no education, knocked at the doors of Opportunity. For twenty-two years she had lived in the mountains. Before night a position had been secured for her in one of Denver's best families. She also went to school. After three years she is a bookkeeper in a large business house and is putting a sister through school.

A man of forty who had been an elevator pilot became a bookkeeper for a machinery company. A Swedish girl who was unable to speak a word of English came to the school, completed the English course, and was employed by an irrigation company at $150 a month. One boy out of the school wrote: "I was an elevator boy earning $40 a month. I now make $125 a month and have a stenographer of my own." One day Miss Griffith saw a little stock girl called down for trying to show goods. She was invited to the Opportunity school. Three years later, she proudly showed a check for $150, her monthly salary with one of the big railroad companies.

An unskilled laborer reported to the school that his girl would not marry him because he had a defect in his speech. A year and a half has passed; through the efforts of the school he has become a skilled laborer and the girl has married him. One man brought his wife to the school. She was a beautiful little woman but she had worked in the cotton mills of the South and had never learned to read. "I recall nothing more interesting than the sight of that man and his wife walking down the street of an evening, spelling out the words on the electric signs," said Miss Griffith.

One day a man came to the school with the explanation that he had been promoted to a position which necessitated the use of fractions, but that he did not know how to use them. The school immediately made arrangements with the firm for which the man worked to hold the position open until he could master fractions.

Shortly after the school opened it was found that many of the young people were coming to school direct from work without any supper. So free soup was served every evening through the generosity of Denver people.

When the employment department secures a position for a young stenographer or bookkeeper, an expert is usually sent with her from the school. This expert helps the young person to get on to the work and if she becomes tangled up, straightens things out. When a boy from the school secures his first position, the manager of that concern very probably will hear his telephone ring.

"This is Miss Griffith," a voice will say. "We're sending you down a boy. Now I want you to go down and get acquainted personally with that boy. We're going to do our part at this end of the line, and we want you to do yours."

The citizenship class is one of the most important features of the school. As in every large city there are many people of foreign birth in Denver. In four years more than 3,700 men have passed through this department of the school. Little community centers have been started in different parts of the city among the foreign-born women. Here groups of Polish, Russian, and Italian women are interested in neighborhood gatherings and learn some useful household arts and the English language.

And then there are the bad boys. It quite often happens that there are boys who do not seem to fit in with the other schools and are sent to the Opportunity school. The very first time that boy hands in a paper, he finds a whole lot of red marks on his paper and very few blue ones. The teacher explains that she has become so interested in all the good things about that paper that she has marked them in red. "Being sent to the office" at the Opportunity school is entirely different from that at most schools. "I act just as if I wanted to see that boy," Miss Griffith explained. "I never mention why he happened to come to see me. I explain to him all about the possibilities in vulcanizing or automobiles, for example, and try to find something that interests him especially."

In fact, there is no limit to what this great university for the people does for its students. From Miss Griffith, on down through Mrs. Martha F. Miller, the assistant principal, there is a spirit of co-operation and interest in what everyone is doing. The school never loses its friendliness or its abiding faith in the goodness of people. And this, of course, has contributed largely to the success of the school.

Whatever you want at this school, you get.

Two Pennsylvanians in the Cabinet

WHEN those twelve men who advise the President gather around the Cabinet table twice a week at the White House to discuss momentous questions of national interest and of world import, it is interesting to visualize the group and consider the wide varieties of American life from which they came. There is, for instance, Albert Bacon Fall, the southern gentleman who has become a grandee of the Mexican border; there is Henry C. Wallace, Iowa scientific farmer; and again there is Calvin Coolidge (for the Vice President sits in the Cabinet council), austere Puritan of New England. No contrast, however, is stronger than that between Andrew W. Mellon and James J. Davis, both of the state of Pennsylvania.

Mr. Mellon, son of wealth, breathing throughout his life the atmosphere peculiar to those who are somewhat set aside by the possession of much money and the administration of large affairs, is of a different world from that of Mr. Davis, iron worker in mills such as his associate has called into being by the score.

I have been to see each of these Cabinet officers and have asked each to tell me of the early experiences which laid the foundations for the important work that has come to him. The characteristics of the men are indicated by the manner in which each received me. Mr. Mellon, carefully reared in a family of wealth and exclusiveness in Pittsburgh, approached the problem of being interviewed with great hesitancy. He had always lived a life apart. For fifty years he had been an official in a great banking organization, sitting far back in its inner offices and very difficult of approach. He had not met with many people, had maintained a dignified reserve. He had never been part of a world where the hurly-burly of personal contact entered.

Quite different was the attitude of James J. Davis, normally genial and full of talk, who had grown up in the home of his iron worker father in Sharon, Pennsylvania, not very far from Pittsburgh, and who had gone about the world of late occupying himself with organizing posts in that fraternal order, the Moose. To Davis the latchstring hung out to all the world and to him an opportunity to recount the events of his past was an occasion so pleasurable that he was likely to yield hours to it in forgetfulness.

But Mr. Mellon did tell me many of the events of his life—a story of the growth of a family from complete obscurity to prominence and power, a story of another of those miracles of America. He told me, for instance, that his father had been born in the North of Ireland and had come as an immigrant to America when a small boy. The family, he said, had more of Scotch blood than of Irish. It settled on a little farm thirty miles from Pittsburgh and it was there that the elder Mellon grew up. From the farm, however, he came down to this busy little city which was just then growing into industrial activity. There he studied law in the University of Pittsburgh, graduated, practiced his profession, and became a dignified and influential judge on the bench, acquired wealth and grew to be a pillar in the community.

This elder Mellon was the father of five sons and as they grew to maturity he took thought of the careers which they should lead. He estimated the possibilities in this formative city of Pittsburgh and decided that banking offered for his sons careers of great promise and possibility. He established a bank upon a sound foundation and distributed its stock to the younger Mellons. He preached to them the gospel of constructive participation through this bank in the affairs of the city and community. Today, if one turns to the name of Mellon in Who's Who, he will find but three men listed out of the hundred million: Andrew W., Secretary of the Treasury; James R., his brother; and William L., his son, all three bankers of Pittsburgh.

When he was 17, Mr. Mellon said, he began spending his vacations at work in the bank. When he was 19, for example, he went down to Baltimore where he participated in the development of a subdivision of that city, supervising the distribution of hand bills advertising the weekly sales of lots. He remembers well that it was while working in Baltimore that he first came to the city of Washington, delved into its museums, watched its lawyers at work, viewed the externals of the government machine. On another vacation he went to Europe with another Pittsburgh boy of his own age, Henry Clay Frick, himself destined to become one of the great figures in the industrial development of the nation. These two boys traveled about the cities of Europe for five months surfeiting themselves with viewing the sights of the Old World.

Then came those decades spent in the inner offices of his own bank in Pittsburgh, a bank which grew constantly in strength and influence, a bank which was interested in any phase of development which came to the city of steel and which found itself lending aid to many industrial undertakings.

For four decades Andrew W. Mellon has been a directing official in this Pittsburgh bank, has extended his influence to one after another similar institutions, has been the quiet figure back of many an undertaking that has aided in the development of this industrial metropolis. His policy has always been constructive. As typical of the sort of undertaking to which he lent himself, there exists today the town of Donora just outside of Pittsburgh, a municipality built that it might take care of the activities of huge steel mills established by this one man. All enterprises of the Mellon bank and its allied institutions seem to have prospered and today this quiet, gray, unobtrusive gentleman is reputed to be the wealthiest individual in America next to Rockefeller.

So at the age of sixty-six, Andrew W. Mellon comes to Washington as Secretary of the Treasury. He makes no claim of having come exclusively because of a desire to render public service or because of a belief that he above other men could best meet a national emergency. He says that he was ready to retire, that men must quit some time and that the Treasury Department in Washington offered him a place to light, an excuse for breaking away from his lifelong activities. He says he will serve in Washington until his job is finished and then give himself over to the quiet he has earned.

What sort of man do you conceive is this master of finance? Do you picture him as the huge, iron-jawed man of indomitable will who bowls all obstacles over before him? If so, be prepared to revise your opinions and let me describe Mr. Mellon.

I saw him standing one day at the side door of a fashionable Washington hotel. A reception was being held and the weather had changed and was threatening rain. The porters were hurrying to put up the awnings across the sidewalk. Mr. Mellon was evidently expecting someone to arrive by that doorway, probably his young daughter who acts as his hostess in Washington. He stood there, a slender, frail, shy, gray little man, somewhat awkward and ill at ease. He is probably five feet five in height and weighs 115 pounds. His hair, which he retains, is white, while his moustache is gray and short cropped. His face is sharp and sallow and the parchment-like skin is stretched tight over its bony structure.

The porters running back and forth that day with the parts of the awning structure thrust him almost rudely first to one side and then to another. So unobtrusive was he that they never dreamed of his being the man who presided over the financial destinies of the nation.

Mr. Mellon appears to be a man of great paucity of words. He talks hesitatingly, expresses himself with difficulty. I heard one who had interviewed him say that were he as poor in dollars as he is in words he would be in the bread line. Yet this impression is not entirely correct and I can easily imagine that with his intimates when the restraint of a natural timidity is broken down he is a man of charming companionship. He talked to me, for instance, of the time when he was a youngster just coming to maturity when he used to read to his father whose eyesight was failing. It seems that the elder Mellon was a great student and fond of philosophy. So it was largely Herbert Spencer that Andrew Mellon read to his father and the same text was gone over many times. This, Mr. Mellon tells me, was the foundation of the philosophical reading which he has carried on through all the years of his life.

Such is the man to whom is entrusted the financial program of the United States in these days when the rehabilitation of the world depends largely upon the acts of this financially dominant nation.

Now look at this other Pennsylvanian, James J. Davis, over at the Labor Department. Mr. Davis was born the son of a puddler in the iron mills of Tredegar, Wales, forty-seven years ago. He was seven years old when his father came over to America, worked a year in the iron mills of Pennsylvania and sent money back for the transportation of his wife and six children to this land of promise.

The little Welsh mother, assaying her worldly possessions, decided that in addition to her children there were two family possessions with which she could not part. These were the two feather beds which to Welsh housewives are a prerequisite of family comfort. So when the little mother arrived in the storage at Castle Garden with her six children she had these two feather beds compressed and tied up in bundles against the establishment of the new home. Great was the confusion of landing and great was the happiness of that reunion. But it was marred by the fact that those two feather beds were that day lost and this loss has stuck in the mind of James J. Davis and now that he is Secretary of Labor and administers the Bureau of Immigration he has taken steps for a more careful handling of the packages of those who would make their dreams come true by coming to America.

Once established in the town of Sharon, the Davis family soon found itself an active and independent element in the life of the New World. There was the iron mill for the father and the public school for the six children and the workman's cottage in which the mother maintained the home. Great as was this institution of the public school, however, the Welsh iron workers could not get away from the theory that when an opportunity presented itself for earning good money nothing should stand in the way of grasping it. So when, at the age of twelve, Jimmy was offered a roustabout job in the iron mills, he accepted. Then and there began his apprenticeship. By the time he was sixteen Jimmy had acquired such a mastery of his tasks that he was admitted as a full-fledged member of the Iron Workers' Union, was entitled to draw a man's pay. Not many years had elapsed before the youngster felt the call of the great outside world and began to drift about, working in different steel producing cities, even as far away as Birmingham, Alabama. So at the age of twenty-one he found himself working in the tin plate mills of Ellwood, Indiana, and before long he bore the title of boss roller and received ten dollars a day.

(C) Harris & Ewing

ANDREW W. MELLON,
Secretary of Treasury

It was while working in the tin plate mills of Ellwood that James Davis got his first taste of public service. He became chairman of a committee the duty of which was to dispense sick benefits to workers in the mills who required them. He became enthusiastic over this task and so organized it that illness among the workers of Ellwood no longer brought tragedy to their families.

And this sick benefit work called attention to the young boss roller. Eventually it came to pass that the workers in this town demanded a degree of recognition in its political offices. James Davis became the workers' candidate for city clerk. Somewhat to his surprise he was elected. Thus he found himself holding his first public position, one which paid him forty dollars a month and to hold which he was forced to relinquish a job that paid him ten dollars a day. Not only this, but he found himself without the education that was necessary to perform the duties of city clerk.

So he left his job in the tin plate mills, pocketed his savings and went back to Sharon, Pennsylvania, and there, in a business college, in the four months that intervened between his election and his inauguration, he acquired the necessary knowledge of accounts to become city clerk.

He served four years as city clerk and four years as county recorder and delighted in his tasks for here the geniality of his disposition found its desired outlet. Then, just as his term as recorder was expiring, there came to him a proposal to become organizer for the Order of the Moose. The Moose is one of those fraternal organizations, the chief purpose of which is to provide sick and burial benefits for its members. It had been in existence for twenty years, yet in 1906 it had in all the world but 246 members. The measure of the success of this man Davis as an organizer is shown in the fact that the Moose now has seventeen hundred lodges and six hundred thousand members.

The culminating glory of the work of the Moose and of Mr. Davis is the institution known as Moosehart, located on a tract of land thirty miles west of Chicago on the Fox River and which is an outgrowth of the Welshman's early sick benefit work at Ellwood. It is to this institution that the orphan children of the members of the Moose are brought and it is here that they are cared for and educated with a care that approximates that of the well-regulated home. Moosehart is one of the admittedly best institutions for orphan children that exists in the world. It carefully avoids herding the children together on an impersonal basis. They live in cottages presided over by the mothers of some of them and their lives approach those in good homes. That each child should be given an education equal to that of the high school and that each should acquire a trade is the ambition of those who operate Mooseheart. Every member of the Moose in all the world contributes two dollars a year to maintain this institution, which amounts to the sum total of $1,200,000 a year and that sum is adequate to develop and maintain the home on a very ambitious scale.

It was to this iron worker who became an organizer and who evidenced the possession of very human qualities that the post of Labor Secretary in Mr. Harding's Cabinet came. A stocky Welshman is this man Davis, sturdy of physique and handsome of feature. He has a big and masterful head like his fellow Welshman, Lloyd George, adorned by a mass of dark brown wavy hair. His eyes are big and brown, his nose is aquiline and his features as handsome as those of any star of the screen.

He is genial, hearty, enthusiastic, given to the theory of gathering around the table and discussing as man to man those issues which ordinarily breed strife. He is the peace maker between labor and capital for the United States Government and strong in the conviction that he can prevent destructive strife during this vital period of reconstruction.

JAMES J. DAVIS, Secretary of Labor

Jewish Power and America's Money Famine

The Warburg Federal Reserve Sucks Money to New York, Leaving Productive Sections of the Country in Disastrous Need

THE international Jewish banker who has no country but plays them all against one another, and the international Jewish proletariat that roams from land to land in search of a peculiar type of economic opportunity, are not figments of the imagination except to the non-Jew who prefers a lazy laxity of mind.

Of these classes of Jews, one or both are at the heart of the problems that disturb the world today. The immigration problem is Jewish. The money question is Jewish. The tie-up of world politics is Jewish. The terms of the Peace Treaty are Jewish. The diplomacy of the world is Jewish. The moral question in movies and theaters is Jewish. The mystery of the illicit liquor business is Jewish.

These facts are unfortunate as well as unpleasant for the Jew, and it is squarely up to him to deal with the facts, and not waste time in trying to destroy those who define the facts. These facts are interpreted by the Jew and the anti-Semite with strange extremes of blindness. The Jew never gets the world's point of view at all; he always gets the anti-Semite's point of view; and the anti-Semite is equally at fault in always getting the Jew's point of view. What both need is to get society's point of view, which is the one being set forth in this present series of articles.

Jews Must Try to Find Solution

TO SAY that the immigration problem is Jewish does not mean that Jews must be prohibited entry to any country; it means that they must become rooted to a country in loyal citizenship, as no doubt some are, and as no doubt most are not. To say that the money question is Jewish does not mean that Jews must get out of finance; it means that they must rid finance of the Jewish idea which has always been to use money to get a strangle-hold on men and business concerns, instead of using finance to help general business. To say that the tie-up of world politics is Jewish does not mean that Jews, as human beings, are to be denied a voice in affairs; it means that they must give up trying to make the world revolve around the Jewish nation as its axis. To describe the influence of the Jew on the theater is not to demand that he leave the theater, but it is to demand that he rid the theater of his idea that sensualism is entertaining.

The Jewish Question is first for the Jews to solve; if not, the world will have to solve it for them. They may stay in business, say the theater, for example, if they will cease spoiling the theater; if they do not cease, the theater will be taken away from them just as certainly as that day follows night. The world has been patient and the world will be fair, but the world knows the limit of imposition.

It is not the true Jewishness of the Jew, nor yet the nationalism of the Jew that is on trial, but his anti-national internationalism. A true Mosaic Jew—not a Talmud Jew—would be a good citizen. A nationalist Jew would at least be logical. But an international Jew has proved an abomination, because his internationalism is focused on his own racial nationalism which in turn is founded on his ingrained belief that the rest of humanity is inferior to him and by right his prey. Jewish leaders may indulge in all the platitudes they possess, the fact which they cannot deny is that the Jew has for centuries regarded the "goyim" as beneath him and legitimately his spoil.

International Jewish Banker Confesses

THE internationalism of the Jew is confessed everywhere by him. Listen to a German banker: imagine the slow, oily voice in which he said:

"We are international bankers. Germany lost the war?—what of it?—that is an affair of the army. We are international bankers."

And that was the attitude of every international Jewish banker during the war. The nations were in strife? What of it? It was like a Dempsey-Carpentier bout in New Jersey, or a base ball game in Chicago—an affair of the fighters—"we are international bankers."

A nation is being hamstrung by artificial exchange rates; another by the sucking of money out of its channels of trade; what of it to the international banker?—he has his own game to play. Hard times bring more plums tumbling off the tree into the baskets of the international bankers than does any other kind of times. Wars and panics are the Jewish international bankers' harvests.

Citizens wake up with a start to find that even the white nations are hardly allowed to see each other nowadays except through Jewish eyes. When the United States supposedly speaks to France, through whom does she speak? All that France sees is Otto H. Kahn! Why must a Jew represent the United States of America to France? When France supposedly speaks to the United States, through whom is it done? Through Viviani, Jewish in every thought and method. Now they are talking of sending Millerand over, another Jew. Britain sends Lord Reading. Germany sent Dr. Dernberg. And to other countries the United States sent Morgenthau, Strauss, Warburg, and lesser Jewlings.

It comes with something of a shock to learn that Foch is coming to the United States. We have not seen a Frenchman since Joffre visited us. It is good to see men of the white race come across the sea as if to reassure us that white men still live in those countries. The business of the Peace Conference was done by Jews—has it come to a point where international diplomacy is to become a Jewish monopoly also? Must the special conversations between France, Britain and the United States be held through Jewish interpreters, while Anglo-Saxons and true Frenchmen do the routine embassy work—or shall it be possible for the non-Jewish nations to see one another occasionally through non-Jewish representatives?

Internationalism is not a Jewish conviction but a Jewish business device. It is most profitable. In diplomacy and at the immigrant station, internationalism pays. Jews interpret nation to nation in the high rites of special conversations between governments; Jewish interpreters swarm at the ports of every country also, where the poor swarm in. It was stated in the House of Lords the other day that most of the trouble in Palestine was caused by Jewish interpreters. It was charged that the Jewish administration added an extra language to the official list in order to make Jewish interpreters indispensable.

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

"A Jew Let You Into This Country"

GO THROUGH the government of the United States, where the income tax secrets are kept, where the Federal Reserve secrets are kept, where the State Department secrets are kept—and you will find Jews sitting at the very spot where International Jewry desires them to sit, and where nothing is kept from their knowledge.

Go abroad and come back to your country, and a Jew will open the gate to let you in, or close it to keep you out—as he chooses.

"Will you be going to Detroit while you are here?" asked a Jewish government agent of a gentleman entering the country on a visit a few weeks ago.

"I may go to Detroit," was the reply.

"Well, you go to the damned DEARBORN INDEPENDENT and tell them a Jew let you into this country," said the government agent.

What the visitor replied is known, but had better not be quoted. The American Jewish Committee might shriek that the people were being incited to pogroms.

The incident, however, is but a sample of what is occurring every day. The truth about the Jewish Question in the United States is perhaps the one form of truth that cannot be indiscriminately told.

The international Jewish bankers regard themselves as in similar fashion "letting" the nations do this or that, regarding the nations not as fatherlands but as customers—and as customers in the Jewish sense. If an army wins or loses, if a government succeeds or fails, what of it?—that is their affair—"we are international bankers," and we win, whoever loses.

For international Jewish bankers the war is not over. The period of actual hostilities and the emergencies of the nations were but the opening of the trade. The ready cash was skimmed in then—all the cash the world had. True, some of it had to be distributed among the people as war wages and bonuses, in order to keep the struggle going, but this was soon recovered through the means of high prices, artificial scarcities and the orgy of extravagance deliberately organized and stimulated among the people. That phase over, and money disappeared.

Is there any more tragic joke than that diligently disseminated in this country—"The United States has more gold than any other country in the world." Where is it? How long since you have seen a piece of gold? Where is all this gold—is it locked up in the Treasury of the United States Government? Why, that government is in debt, desperately trying to economize, cannot pay a soldier bonus because the finances of the country cannot stand it! Where is that gold? It may be *in* the United States, but it does not belong *to* the United States.

The American farmer, and those American industries which were not "wise" to the tricks of international Jewish bankers, and who were nipped by small loans, are wondering where all this money is. Furthermore, Europe, suffering from every possible lack, is looking to us and wondering where the money is.

Jewish Political and Financial Headquarters

THIS dispatch in a London paper may throw light on the matter: (italics are ours)

> "It is learned today that new gold shipments aggregating $2,800,000 are consigned to Kuhn, Loeb & Company, New York, making nearly $129,000,000 imported by that firm since the movement started. In responsible banking circles the belief is expressed that some of the *German* coin recently imported by the firm *is from Russia, instead of Germany*, as generally supposed."

This dispatch, coupled with one printed in a former article which showed Warburg & Company of Germany arranging with Kuhn, Loeb & Company of New York for a $5,000,000 loan to Norway, is not devoid of light on the question—*Where is the money?*

The Jewish international banking system may be easily described. First, there is the international Jewish headquarters. This was in Germany. It had ramifications in Russia, Italy, France, Great Britain and the South American states. (South American Jewry is very menacing.) Germany and Russia were the two countries scheduled for punishment by the International Jewish bankers because these two countries were most aware of the Jew. They have been punished; that job is done.

Jewish political headquarters, as related to the internal affairs of the Jews, was also located in Germany, but the headquarters dealing with the "goyim" was in France. Statements have been made that the political center of Jewry has been transplanted to the United States. But these statements have been made by American Jews whose wish may have been father to the thought. During the Wilson Administration it was possible for a Jew to think and to hope this, but affairs have slightly changed. The ousting of American Jews from the Zionist movement at the behest of Eastern Jews indicates that if the political center of world Jewry has shifted to the United States, the *power* is still in the hands of *aliens* resident here. The center is still in Jewry; the United States is merely a square on Jewry's world checker-board.

Fine for War: Helpless in Peace

BUT, wherever the financial and political world centers may be, each country is separately handled. In every country—the United States, Mexico and the republics of South America; in France, England, Italy, Germany, Austria—yes, and in Japan—there is an international Jewish banking firm which stands at the head of the group for that country. Thus, the chief Jewish firm in the United States is Kuhn, Loeb & Company, of which one of the members is Paul M. Warburg, brother of M. Warburg & Company, of Hamburg; and another member of which is Otto H. Kahn, resident successively of Germany, Great Britain and the United States, and self-appointed financial spokesman for the United States to France and Great Britain. Great Britain and France seldom see a special American spokesman who is not a Jew. That may be the reason why they reciprocate by sending Jews to us, thinking perhaps that we prefer them.

Paul M. Warburg was the inventor, perfector and director of the Federal Reserve System of the United States. He is not the only Jew in the Federal Reserve System, but he was the chief Jew there. His mind counted for a great deal. There were others in the war government, of course; Bernard M. Baruch; Eugene Meyer, Jr.; Hoover's regiment of Jews; Felix Frankfurter; Julius Rosenwald—hundreds of them, and everywhere; but the financial group alone is receiving

our attention just now, and they are not so notably successful in getting the country out of financial difficulty as they were in other lines of effort.

The Federal Reserve System may not be a bad system, in spite of the fact that it yields government monetary functions to private financial corporations, but there are all sorts of testimony that it has been badly manipulated. Mr. Warburg, the reader will remember, spoke about certain things being "overcome in an administrative way," showing that there was a certain amount of "play" or loose motion in the system which could be manipulated either way. The fact remains that the country went swimmingly through the war by reason of the assistance of the System, and is coming very lamely through the Peace, as the result, monetary experts say, of the hindrance of the same System. Mr. Warburg whose name was so prominently connected with the advertisement of the glory of the System, must also stand being mentioned in connection with the criticism.

The Masters of Cash Never "Caught"

WHATEVER money we are said to have as the per capita in the United States, it is a false statement. The money *per capita* should always be figured on the basis of the money *in circulation.* The statistical "per capita" is not always in circulation. Less than half of it, as a rule. The rest is being juggled.

Whatever the *gold* in the country, the *wealth* is still greater. There is more wealth in the United States than there is gold in the world. One year's products of the farms of the United States exceeds in money value all the gold in the world.

Yet, under our present system, the burgeoning bulk of the country's *wealth* must *pass through the narrow neck of Money.* And the *Money* must pass through the *still narrower neck of Gold.* And the controller of the Gold, under our present system, controls the world. There is more wealth than there is money; there is more money than there is gold; money exists at the pleasure of gold; wealth moves at the pleasure of money. Whoever sits at the neck of money, opening or closing as he will, controls the movement of the world's wealth. And the world's prosperity depends on the movement of that wealth. When wealth stands still and does not pass from hand to hand, the world's circulation has stopped; the world becomes economically sick.

The scarcity of cash in hand has led to Credit. Credit is a form of barter. It is a form of dealing by which many transactions are carried on, only the final one being cleared in money. It is a device which has its dangers, in spite of the efforts of apologists to exploit its advantages. But one thing the system of Credit indubitably does—it allows the money masters to hang on to the *Cash.* When the world is caught, *it is caught with paper,* not with Cash. The Cash is always in the hands of those who extol the advantage of the Credit System. Who holds money holds power, and will hold it, until real barter or *real money* comes in fashion again.

In 1919-1920, according to one of the best monetary authorities in the United States, the total shrinkage in values of the products of our fields, mines, factories, mills and forests represented a sum greater than the total gold supply of the world. It runs as high as the total amount of Liberty Bonds outstanding.

Federal Reserve vs. National Condition

PEOPLE say, "Well, the prices were too high." Certainly they were too high, but who and what made them too high? It was the generosity with which money was supplied by the private Federal Reserve System. There was plenty of money. People say, "Well, the shrinkage is only in paper values; the real value of the product is still there." Certainly, but when you live under a system in which "real" value and "money" value are so intimately intertwined that it affects your bread and butter, the tenure of your farm, and the steadiness of your job, it is pretty hard to separate the two. Moreover, when your prosperity was due to the readiness of a group of men to let out money, and your adversity is due to the unwillingness of the same group, and your own welfare and your country's welfare is thus see-sawed up and down without any reference to natural law but solely upon determinations taken in committee rooms, you naturally inquire, "Who is doing this? Where is all the money gone? Who is holding it? Here is the wealth of the country; here is the need of the country; where is the money to transfer the wealth to the need? Every condition remains as it was, except money."

We have a Federal Reserve System which still is benefiting by the assistance of its perfector and director, Paul M. Warburg. And what is the condition in the United States?

Some of the biggest industrial institutions in the country now in the hands of creditors' committees.

Farmers being sold out by the hundreds, their horses bringing about $3 each.

Cotton and wool enough to clothe the nation, spoiling in the hands of the men who raised it and cannot dispose of it.

Every line of business, railroading, newspaper publishing, store-keeping, manufacturing, agriculture, building, in depression. Why? For lack of money.

Where is the money? This is the country that is supposed to be the financial center of the world—*where is the money?*

It is in New York. The Federal Reserve System, which Mr. Warburg desired to head up in one central bank, has just about turned out that way. *The money is in New York.* Here is the charge made to the governor of the Federal Reserve Board by a responsible public official who knows:

While there is a scarcity of money for the producing sections of the West and Northwest, the South and Southwest, "we find that individual banks in New York City are borrowing from the Reserve System, in a number of cases, more than $100,000,000 each; and sometimes as much as $145,000,000 is loaned there to a single bank—*twice as much* as some of the Reserve Banks have been lending recently to *all* the member banks in their districts."

One bank in New York borrowed $134,000,000, *or $20,000,000 more* than the Federal Reserve Bank of Kansas City was advancing to 1,091 member banks in that Reserve District which covers the states of Kansas, Nebraska, Colorado, Wyoming, and parts of Missouri, Oklahoma and New Mexico.

"Jew York" Always Gets Money

AT THE same time, another New York bank was borrowing from the Federal Reserve Bank about $40,000,000, which was *more than the aggregate loans which the Federal Reserve Bank of Minneapolis was lending to its 1,000 member banks* in the great states of Minnesota, North and South Dakota, Montana and part of Wisconsin.

Another New York bank borrowed from the Federal Reserve Bank a sum which was *greater by $30,000,000 than the Federal Reserve Bank at Dallas was lending to all the banks in Texas, Louisiana and Oklahoma.*

Still another New York bank got a loan which *equaled the total loans allowed by the Federal Reserve Bank of St. Louis to the 569 member banks* of that very important district, which includes the whole state of Arkansas, parts of Illinois, Indiana, Kentucky, Tennessee and Mississippi, and the larger part of Missouri.

Take the Fifth Federal Reserve District, served by the Federal Reserve Bank at Richmond, Virginia: one New York bank was able to borrow from the New York Reserve Bank *more* than the Richmond Reserve Bank would lend to all its member banks in Maryland, Virginia, North and South Carolina and the larger part of West Virginia.

That is the situation. The twelve regional banks, which were supposed to make money serve all parts of the country equally, have apparently been "overcome in an administrative way" to such an extent that the New York Federal Reserve Bank is to all intents and purposes the Central Bank of the United States, and serves the speculative part of the country with millions, while the productive part of the country is permitted to wilt with paltry thousands.

When it can occur that four New York banks can borrow from the New York Federal Reserve Bank as much money as the banks of 21 states were able to borrow from the five Federal Reserve Banks of St. Louis, Kansas City, Minneapolis, Dallas and Richmond —there would seem to be need of explanation somewhere.

A Suction Pipe From West to East

WHERE did this money loaned in New York come from? It came from those parts of the country where money was scarcest. In May, 1920, the word went out over telephones—"The tie-up will come on the 15th." And it came. Credit was stopped. Payment was pressed. A stream of money, literally squeezed out of the producing sections of the country, began to roll toward New York. Otherwise those giant loans just recorded would have been impossible. It was pressure, Federal Reserve pressure, politely known as deflation, and that is the way it worked. The banks of the West were squeezed dry that the banks of New York might overflow.

"The money was withdrawn from legitimate business in various parts of the country to be loaned at fancy rates in Wall Street," says the official referred to above.

The speculative banks, it has been discovered, were able to borrow money at six per cent, which money they loaned at as high as 20, 25 and 30 per cent.

Federal Reserve deflation created a scarcity which speculative banks utilized. The Federal Reserve policy took the money out; New York banks borrowed the money thus taken out, and loaned it at tremendous rates—rates which people paid to stave off the ruin caused by the moneyless condition which the ill-measured deflation process brought on.

And all this time the Federal Reserve System was in the best financial condition of its whole career. In December, 1920, it had 45 per cent of its reserves, which was a higher reserve than it had in December, 1919. But at this writing (July, 1921) the reserve has reached 60 per cent.

The money is in New York. Go out through the agricultural states, and you will not find it. Go into the districts of silent factories and you will not find it. It is in New York. The Warburg Federal Reserve has deflated the country. A System that was intended to equalize the ups and downs of financial weather has been used "in an administrative" way to deplete the country of money.

Federal Reserve's Own Reserve High. Why?

THE Federal Reserve Idea was doubtless right; if it had not been, it could not have been established. But it has been manipulated. It has not been a "federal" reserve; it has been a private reserve. It has been operated in the interest of bankers and not of everyone in general. Capable of being used to carry the country gradually back to a natural flow of business and to a natural level of prices, it was used to bludgeon business at a critical time and to bludgeon it in such a way that money-lenders profited when producers suffered.

If that is the fact, there is no American banker but will say that the method was wrong; economically wrong, logically wrong, commercially wrong, if not criminally wrong.

Today the Federal Reserve boasts of its own reserve as if that were a sign of national economic health. With the country struggling to live, the Federal Reserve ought to be low, not high. The height which the reserve has reached is a measure of the depth of the country's depression.

If the Federal Reserve would let out a part of that flood of money—a high financial authority suggests that less than 10 per cent would do it—it would be like an infusion of blood into the nation's veins.

Kuhn, Loeb & Company, the Speyers and the other Jewish money-lenders have money for Mexico, Norway, Germany, and all sorts of commercial companies being organized to do business overseas, and it is American money. The Warburg Federal Reserve System has been badly misused, badly manipulated, and the country is suffering from it.

Still, the people know not what to do. Money is still a mystery. Banking is still sacrosanct. What would be perfectly apparent if done in ordinary business intercourse with a $5 bill, is exceedingly complicated when the sum is five millions and the parties are (1) country banks, (2) Federal Reserve banks and (3) Wall Street speculative institutions. Yet they are only Tom, Dick and Harry with a $5 bill, after all.

Borrowers Cannot Be Critics

THE matter is somewhat affected by the gags that are placed on many men competent to criticise. High officials are more or less tied up, by campaign contributions in which all financial concerns have an interest. Legislative officials are, too many of them, indebted to these same interests. A schedule of the private debts of some of the men who have aspired to the Presidency in the last eight years would be very illuminating—almost as illuminating as a schedule of the names of Jews at whose homes they stayed while on journeys through the country. Men who are thus tied up with the present financial system cannot say what in their minds they know.

It is all illustrated in the testimony of T. Cushing Daniel before a committee of Congress. It shows to what an extent the power of this private corporation called the central bank can reach:

> "When going through the Bank of England I presented a letter which I had from Secretary Hay, and the official of the bank was very polite. He took me through the bank and when we got back to the reception room I asked him if he would allow me to put a few leading questions to him. He said he would, and I asked him if he would give me a statement of the Bank of England. 'We do not issue statements.' 'Does not the House of Parliament sometimes call on you for some statement as to the condition of the bank?' 'No, sir; they do not call on us.' . . . . 'How is it that some of these revolutionists, so-called, do not get up in the House of Commons and raise the devil to know something about what is going on down here? That would be the condition in our country.' *'Oh, most of them are large borrowers from the bank, and we have no difficulty with them.'* (laughter.)"

He's the Walter Reed of the Plant World

Dr. Elmer Darwin Ball Devotes Life to Discovering Crop Pests

By WILLIAM ATHERTON DU PUY

HERE is a man who has established a scientific fact which, in its bearing on crops that grow in the field, is almost identically parallel with the discoveries of Dr. Walter Reed who, in the days of the Spanish-American War, found that yellow fever was carried by a certain sort of mosquito and that it could be fought by destroying that mosquito.

Dr. Elmer Darwin Ball, who is an entomologist, a student of insects, and who is, at the same time, Assistant Secretary of Agriculture at Washington, is the discoverer of this fact of the transmission of plant diseases by the bite of an insect which inhabits them.

But the story of the man's discovery is so intertwined with the story of his career that it seems almost necessary that we go back to the beginning and follow the course of the development of a man of science through to the day of accomplishment.

There is no more alluring search than that for the origin of the impulses that have driven men on to accomplishment. Dr. Ball, for instance, is a pure scientist and entomologist. His instincts from early boyhood have been scientific. He has a brother, Dr. Carleton Roy Ball, who is chief of the cereal plant studies of the Department of Agriculture. He, likewise, is a true scientist.

These two youngsters grew up on an Iowa farm as members of a family of seven children, none of the others of whom had any scientific tendencies. They were the descendants of John Ball, of Concord, New Hampshire, eleven generations back, and from that early American down to the present date the Ball family had produced no scientists. It is interesting to note, however, that on the maternal side of this family, two generations back, was a Grandma Grimes, who was a woman with a natural bent for science which expressed itself in her knowledge of botany and zoology. And Grandma Grimes came in the day of her age to live with the Ball family and the minds of two of the Ball children responded to her hobby and turned to science.

Idea Took Early Root

WHEN Elmer Ball was 13 years old there came into his hands a bulletin issued by the Department of Agriculture which was entitled "Entomology for Farmers' Sons." Those were the days of the grasshopper plagues in the Middle West and the government was attempting to give farmer boys what information it could that would help them combat the plague which devoured their crops. Elmer Ball read this bulletin over and over again, absorbed the information that it imparted, but reacted to it in a way that was different from that expected by its creators. He determined that he would become an entomologist.

In those days, forty years ago, there were few men in the United States who had made very serious study of the insects of the country. Young Ball attempted to get a list of those men who had made reputations as entomologists. He was able to find but four men known for insect study. To each of these four he wrote a letter telling of his ambition to devote his life to the study of insects, and asking each if there was an opportunity in the practical world for an entomologist, if he would be able to earn a living at that calling.

Of these four scientific men, three answered him in the negative, advising against his pursuing this line. One of the group had the foresight to see that the future offered for students of this sort a great opportunity for usefulness. Dr. Herbert Osborn, of the College of Agriculture of Iowa, encouraged the youngster to devote himself to this little-followed science. So the boy on the farm saved his money and studied hard under the guidance of his own father. When he was 18 he went to this mid-Iowa school and studied under the man who had encouraged him to be a Gulliver and explore the lands of the real Lilliputians.

$1,000 a Year for Catching Bugs

TWO years after he had graduated he returned to the home of his father and there in Northwestern Iowa during the summer vacation, he gathered specimens of those insects which were of importance because of the damage they from time to time inflicted upon growing crops. This was some years after that series of grasshopper plagues that swept the West and that devoured the crops of the farmers for three successive seasons and inflicted upon them as great a hardship as the men who farm in America have ever had to face. Of all the members of the grasshopper family, those which were most deadly to these crops were known as the Rocky Mountain locust. Strangely, after the years of plague, this locust had disappeared and it was with difficulty that even isolated specimens of it were to be found. So one day Elmer Ball, the young entomologist, became greatly excited when he ran upon a cluster of Rocky Mountain locusts. He was working busily in the grass, catching these locusts, when an old acquaintance of his father, a man of mature age, came past. This old man stopped by the roadside and upbraided Elmer. He tried to shame him for devoting his time to so childish a thing as catching grasshoppers. The young scientist tried to explain his object in doing so but made little impression. Finally he said:

"I would have you know, sir, that I am employed by the state of Colorado which pays me a thousand dollars a year for studying insects."

This quite impressed the neighbor, for in those days a thousand dollars a year was an imposing sum of money. No other young man in the whole community had ever earned so much. The neighbor, however, was still unconvinced and his answering argument took the form of a query.

"But what does the other fellow get?" he wanted to know.

And so it becomes a matter of considerable interest to follow along the life line of this young scientist and find out what the other fellow, his employers, in this case the public (for he has always worked for the public) gets out of the fact that this man has made a study of insects.

Growing up as he did in Iowa in the days of the grasshopper plagues, Dr. Ball's first studies were of this insect. Its life history had been quite well established, however, by the time he came to maturity and he sought other fields more virgin. He found right there in Iowa that there was an entirely new world of which few people dreamed that awaited the foot of the explorer. There was a race, or in fact many races, of small creatures akin to the grasshopper but so tiny that they were scarcely noticed. These little creatures were leaf-hoppers and made their homes on and fed upon

(C) Harris & Ewing

DR. ELMER DARWIN BALL,
Who proved that plant diseases are carried by insects.

the leaves of the crops which grew in the fields. Dr. Ball did go into the domain of these leaf-hoppers and learned their life story and the secrets of the purposes that they served, the damages that they did. He found among these leaf-hoppers many creatures not known to science, has given to many of them, which until his time were unnamed, labels which they will carry forever. He has in his office in Washington many other varieties of leaf-hoppers which are as yet unnamed and which year by year he is carefully studying and classifying. There are little trays of them carefully arranged in his drawers to which he devotes much time and attention.

While Dr. Elmer Darwin Ball was thus developing his leaf-hopper specialty, he was also studying other crop pests of Colorado. The first success as entomologist which produced satisfactory financial returns to his employers was made through his development of a scheme for exterminating the coddling moth which is parent to the worm which spoils so many millions of apples every year. This apple worm, in fact, was ruining the crops of that fruit throughout the Rocky Mountain states to such an extent that farmers were chopping down their well-developed orchards and planting the land in other crops.

Saved Apple Crops for States

THIS one accomplishment of the entomologist saved the apple industry to Colorado, Utah, Idaho, Washington, and those other states of the Rocky Mountain belt which was so rapidly growing into a great apple-producing section of the United States. The value of this accomplishment amounts to many millions of dollars annually and makes available unestimated quantities of wholesome food which otherwise would not have existed. It was because of his success in fighting this coddling moth that Dr. Ball became the director of the state college of agriculture for Utah, a position which he held for a number of years.

It was while he occupied this position in Utah that a disease known as curly top attacked the sugar beet plants of the West and threatened their extermination. A great industry had here been developed for 20 years. Extensive areas were under cultivation. A field might have a crop which seemed to be growing and developing toward ideal results. Then, suddenly, curly top would appear, the leaves of the plants would begin to crinkle up. In a little while they would die and the crop would be entirely lost. Dr. Ball went to examine the Spreckles sugar farms in California. They were just being attacked by curly top. He recommended the destruction of growing crops to the value of a million dollars.

The cause of curly top was a mystery which defied the scientists for a decade. It was a disease of the plants, but whence it came and how it was transmitted was the puzzle that they could not solve.

Dr. Ball examined carefully his old friends, the leaf-hoppers, that abounded in all these fields. To be sure, there were great numbers of the leaf-hoppers in beet fields that were unaffected. Likewise, there were leaf-hoppers in the fields that were affected. There seemed to be more in the affected fields than in the unaffected fields. Yet, possibly this leaf-hopper had something to do with the disease. He would take two unaffected plants from the same field and enclose each of them. One of them he would expose to leaf-hoppers from an affected field. The other he would effectively protect from those leaf-hoppers. Thus he would be able to determine whether or not the leaf-hopper had to do with the disease.

New Plant Diseases Discovered

THE plant which was exposed to the leaf-hopper from the affected area caught the disease and died. The unexposed plant thrived. Thus was primary evidence acquired which finally led to the making of a brand new discovery which has led to an understanding of the diseases of plants which did not exist in the world before. It has been found that the leaf-hopper transmits curly top, just as the yellow fever mosquito transmits that disease. The leaf-hopper inserts its beak into the leaves of a diseased plant just as the mosquito inserts its beak into the body of a diseased individual. It acquires the fundamental element of the disease, probably a germ. When the required amount of time has passed for that germ to incubate within the leaf-hopper, it becomes a disease carrier. Every plant into which it inserts its beak thereafter becomes affected and that plant affects every other leaf-hopper which feeds upon it. Thus the disease spreads so rapidly that a single affected plant in a field will very quickly destroy the whole field.

In making this discovery, Dr. Ball gave to the beet farmers the fundamental facts upon which to base any campaign against curly top. The enemy was the leaf-hopper. It was to be combated. If it could not be exterminated, its life habits were to be studied and the beets were to be brought into production at a season of the year when that leaf-hopper was not present. Advantage could be taken of the cycle of the insect's life in such a way that it was not present at the time when the beet fields were susceptible to attacks of curly top. Thus was much progress made toward the saving of another vital crop of the West.

Ten years later there occurred another disease which spread through the potato fields of a great part of the United States. Those potato fields suffered from what the farmers called tip-burn. Beginning at the top of the plants, the leaves gave the appearance of having suffered from drought or too much heat from the sunshine. At first the disease was confused with potato blight which had been known for a long time, which was understood and for which there was an established cure.

Diagnosing a Potato's Ailment

THIS tip-burn which threatened the potato crop of the nation, however, turned out to be an entirely different thing. Dr. Ball was entomologist for the state of Wisconsin at the time this disease appeared, and he early decided that it was quite different from the blight and kindred diseases of potato plants. He examined into it in the light of his discovery of the cause of curly top in sugar beets and made the same tests to determine whether or not this might be a disease transmitted through the leaf-hopper in the course of its feeding upon the plants. He put on the same tests of exposing unaffected plants to insects from affected fields, and again caught the reaction of the contagion carried to those plants by the infected insects.

The fact of the transmission of diseases of plants by this method, by the means through which yellow fever is transmitted by the mosquito, was established in a second case and the secret of the disease which was ravaging another great crop was established.

Just recently the fact has been established that spinach blight is likewise transmitted by the leaf-hopper and is a disease similar to tip-burn and curly top. Thus has the entomologist established and demonstrated new facts with relation to the diseases that attack the food supply of the nation. Thus has one man, who was so foolish as to go about catching grasshoppers, already produced results that mean many millions of dollars in food products to the people of the United States every year, and thus has he opened up avenues of knowledge which in the future are sure to yield other uncounted millions.

Service to Fellows Displaces Hidebound Doctrine

By FRANK M. CHASE

HAD the Rev. Dr. James Wise been a man of less vision he might have solved the question of a dwelling place, when he came to Topeka five years ago to become bishop of the Kansas diocese, more simply. But with characteristic first thought for his church, he arranged for an increase in the personnel of the diocesan staff, though by doing so he eliminated himself from occupying the quarters of his predecessor. The same vision that saw enlarged opportunities for the church, however, solved the problem of the bishop's home.

While the matter of his residence was still giving the trustees concern, Bishop Wise took a stroll about the Episcopal grounds. These consist of a beautiful twenty-acre campus, on which stands the College of the Sisters of Bethany, a girls' school established more than fifty years ago. In addition are a large cathedral and several buildings affiliated with the parish and diocesan headquarters. One of these was a stone barn erected when the college was founded. Architecture is a hobby with Bishop Wise, and his appreciation of the values in the massive old stable, with his natural capacity to visualize, enabled him to see big possibilities in it.

"What a fine home that old barn would make!" he suggested. The idea of a bishop living in a barn did not appeal very strongly to some of the sedate church officers at first, but on finding him sincere in his plan and thankful at being able to solve the housing problem so easily, they gave him carte blanche to remodel the building as he chose. So well was the old structure adapted to the bishop's purpose that it was necessary to make but three additional openings, which, in view of the fact that they had to be cut through sixteen inches of stone, was fortunate. The addition of a porch and three dormer windows were the only other major changes, no redivision of the rooms being required. And so the interior finished and furnished, the former barn was transformed into a home of surpassing refinement and comfort, though even yet a reminiscent caller occasionally reminds Bishop and Mrs. Wise that the preceding bishop's cow stood in their dining room or that his driving horses occupied the living room.

The Rt. Rev. JAMES WISE, Bishop of Kansas

A man who can see a beautiful home in a prosaic barn might easily be expected to take a big view toward the other interests of his life. And in this Bishop Wise offers no disappointment. Indeed it is his big vision of the service of the church that commends him to our present attention. A man of extremely democratic ideals, a leader in civic as well as in church affairs, and possessed of great dynamic force, there is little room in his creed for a church made up only of hidebound doctrine. A church that serves humanity is his conception of its place. He believes also that the church must make room for all the people, for the young as well as the old.

Throughout his ministry the young people have been of special interest to him. In his first rectorship, that of St. Martin's at Omaha, he devoted much time to working with boys, taking groups of them on numerous camping trips. As everyone who knows boys at all is aware, camping has a very strong appeal to them during a large part of the teen age. Bishop Wise's idea simply was to turn this normal and healthful instinct to the account of the church by making a place for it in the religious life of the community and so win the boys' interest in the church itself.

At St. Louis, where he went from Omaha in 1909, to become rector of the Church of the Holy Communion, he continued to work largely with the young people. This was an institutional church, situated in one of the city's poorest districts, and through the children was one of his most effective ways of accomplishing the church's work. Despite the poverty with which the church was surrounded, and the ignorance of the foreigners who formed a large percentage of the population of the district, he built up a large Sunday school and made a record in social service work that undoubtedly had much to do with his selection as bishop of Kansas.

On entering this new field of service, Bishop Wise lost none of his interest in the boys and girls. Rather his vision for them increased as his own opportunity widened. For instead of working with the boys of but one parish he was now in position to promote greater attention to the young people in all the Episcopal churches of the diocese. Consequently, as he traveled among the parishes he urged that the future men and women be kept in mind in planning the church activities. "We have merely suffered the young people in the church too long," he said. "They should have a definite part and place in it." As a result many of the churches began to take more notice of the boys and girls, and more projects were planned for them primarily and not incidentally. Particularly did the number of Boy Scout troops under church leadership increase, and the camping trips such as he used to supervise at Omaha became noticeably frequent.

Then the bishop conceived the idea of a state encampment for the boys. For sixty years adult representatives of the parishes had been coming together in annual conventions and training schools for Christian leadership, where they saw the church as a whole in action and received inspiring views of its work from national leaders. Would not the boys similarly profit from an enlarged view of the work and purposes of the church which they attended? Too often they knew it only as a building where they went, perhaps unwillingly, to a more or less uninteresting Sunday school.

With these thoughts uppermost, but treading new ground a little cautiously, Bishop Wise had about 150 boys from the near-by parishes come to Topeka in the spring of 1920 for a three-day convention. The boys spent the nights in tents on the campus, there were athletic stunts, including a competition among several parish teams for a cup offered by the bishop, and two or three addresses by men who were to speak before the adult convention immediately following.

Though a small beginning, the encampment was a success, and the boys returned to their parishes so enthusiastic over the plan that Bishop Wise repeatedly heard favorable comment on it. Before the next year passed, therefore, he decided to repeat the boys' convention, but to lay the plans earlier so as to work out a more effective program and arrange for handling more boys. Accordingly 428 boys, representing more than thirty parishes of the diocese, were on hand for the second encampment at Topeka in May.

The boys came in a camping spirit and prepared for "roughing it." Some of them came 200 miles overland in motor trucks. They came as delegates of their Boy Scout troops or simply as representatives of their parishes. The bulk of them wore their Boy Scout uniforms, or other costumes suitable for camp life. A group of about forty army tents on the Bethany campus constituted their quarters. For nearly all the boys this was their first experience in tent life, and they had a touch of military regimen along with it. They stood reveille at seven each morning, for instance, had mess instead of meals, and went to bed at taps. The boys ranged from nine to twenty-two years old, the average being the high school boy.

Home of Bishop Wise, at Topeka, formerly a barn.

The first day of the encampment, which was Friday, was largely taken up with the registration of the boys and their assignments of tents. In the evening, however, they went on a motor car ride, visiting the boys' industrial school near the city. Some of the boys from this school had erected the tents for the convention, and were assisting otherwise in entertaining the young campers.

Saturday, the "big day" of the convention, was crammed with interest and activities for the boys from the time they stood reveille until taps were sounded. Following the morning mess a short time was spent in roll call and organizing the convention. Then they listened to an address by George K. Gibson, of Chicago, a business man who left them some very practical things to think about with respect to their attitude toward women.

The selection of a business man as one of the principal speakers illustrated an important aim in the conduct of this gathering. The object was to keep the lay viewpoint foremost, to lead the young folks to an appreciation of spiritual values through something that they already understood, rather than to try to impress them with an avalanche of abstract religious doctrine, no matter how sublime it might be. It was desired, too, to present Christ to them as a man's man, whose spirit could be with them in their games as well as in their religious devotions. Accordingly a big place in the program for athletics was provided, while speechmaking was held down to the minimum. Besides the bishop, who made a short talk to prepare the boys for communion, there was but one other speaker. This was the Rev. Dr. W. F. Pierce, president of Kenyon College, who drew the boys' attention to some of the important considerations in choosing a college.

In the afternoon were numerous exhibitions and contests by the Boy Scouts, and a track meet open to all the boys. In the track meet the teams from the various parishes competed for a cup offered by the bishop. A campfire meeting following the evening mess was among the plans, but as rain interfered with this the 428 boys were crowded into the mess hall where they had been taking turns at eating. Here they participated in group singing and their parish stunts, while the industrial school boys provided a varied entertainment that included band music and boxing. The ribbons which the boys won in the track meet and the bishop's cup also were distributed at this time.

The boys were enjoying themselves, as some of them said, "just an awful lot." In the midst of all this hilarity, following a day of the sports that boys love, it would have been easy for the skeptic to believe that serious religious thoughts were quite foreign to them. But just as the evening's fun seemed to reach its climax, Bishop Wise made his way to the front of the hall and asked for quiet. He got it instantly, and during the next few minutes gave them a heart-to-heart spiritual talk as a devotional preparation for communion the next morning. As one observer remarked, the boys "jumped from boxing to prayer" with equal earnestness, showing that after all the bishop's plan of reaching their religious natures through play was working out.

It was a thoughtful bunch of boys that filed out of the little hall that Saturday night. And no sooner had the first of them reached the door when the rain that had been threatening all evening came down in torrents. The boys ran for their tents and, each with a lighted candle in hand, went down the tented streets to their respective cots under canvas that billowed with wind and rain.

Feeling responsible for the youngsters who, in a way, were his guests, Bishop Wise spent much of the night walking between the rows of tents. Well he knew that among more than 400 boys there is ever the danger of a severe stomach ache or that some imaginative lad might give way in tears to his dire thoughts of such a "wild" night in a tent. So, unknown to the boys, the bishop kept near at hand, ready to give such aid as necessary, and incidentally getting a pretty straight line on the real reactions of the boys. He was impressed particularly with the fine spirit in which the boys accepted the unpleasant circumstances of the encampment as well as the thoroughly enjoyable parts. "I did not see a particle of grouchiness shown in the entire affair," he said. "With one exception, too, I did not hear an oath, which I considered a good record, even for a bunch of Sunday school boys."

Rising at seven Sunday morning, the boys attended communion at the cathedral a half hour later, though actual participation in the communion was not expected nor required of the boys whose beliefs forbade them making it in other churches. Mess followed, while at ten-thirty the boys attended the regular cathedral service with the adults. This concluded the three-day program for the boys.

"It was truly inspiring to see those boys make their communions," said Bishop Wise. "The service seemed to mean more to them than before, doubtless because of their enlarged view of the church. In the encampment they met boys from over all the state who were members of the same church and worshiped in the same way, whereas their former idea of the church was bounded by the borders of one parish. This bigger view could not help but awaken an increased pride and satisfaction in their church. Next year we hope to have girls as well as boys at the young people's convention. This arrangement can be effected by holding the gathering after Bethany College has closed for the summer.

Bishop Wise is a fore-thinker. It is on visions like these that tomorrow's church will stand.

Within the Sacred Precincts of Diplomacy

By GEORGE A. SCHREINER

This is the third of several stories by Mr. Schreiner, based on his experiences as an Associated Press correspondent. The fourth will appear in an early issue.

MUCH has been said recently anent *secret* diplomacy. The phrase was one of the red herrings of the war, because within itself it has no meaning at all. There is no *secret* diplomacy, because all diplomacy is secret.

The fact that Mr. Wilson is the discoverer of *secret* diplomacy does not necessarily mean that there is such a thing. The dust that was raised from the pages of history was merely an excursion into the perfectly obvious—a trip to the diplomatic Coney Island with a description of some chute-the-chute resulting therefrom.

This preamble should be kept in mind, because it will contribute much toward the understanding of what is to follow.

The great noise concerning *secret* diplomacy was a beating of the war tom-tom. To the pretexts for war that were fashioned it was the engineer's drawing; just a fine diagram on paper that had no meaning to those who drew it. The member of government who will prate of secret diplomacy is either dishonest or does not know what he is talking about. As said before, there is diplomacy, but no *secret* diplomacy, because diplomacy and secrecy are one and the same thing, immutable and indivisible—a Zoroastrian god.

Must "Educate" the People

WE ARE still looking for the government that has the habit of giving to the press any of its diplomatic correspondence, except when it wants to gain something thereby. The publication of notes, treaties, and such, by governments is invariably based on questionable intent. The government has either worked itself into a position where it must step before the public to cover up its tracks, or it has become necessary to prepare the governed for the ultimate—war. When a government starts to publish notes and treaties the ultimatum is not far off.

The logic of this is very simple. Not even a czarist government can afford to break into print with the ultimatum itself. For years the dear public has had of its international relations only the inkling which enterprising journalists have given.

Even the strongest jingo might faint did he read at the breakfast table that the government had gone to war over night—without the consent of the people! That would be too sudden. It would be foolish, because the public must be prepared to make the sacrifices in blood and treasure which the war will call for.

Before a government can go to war, it must *educate* the governed. That takes some time, naturally, and it takes suitable means. The archives of the foreign office are consulted and everything favorable is given to the press. The waking and intensification of race and political prejudices has become necessary. The latent passions of the beast in man must be fanned into soul-searing hatreds. The wrath of the many must be mobilized.

To dumbfound the public would not be the proper method. So the governed are taken into the confidence of the government. The *news* given out is in itself *a fait accompli*. As yet the fact of war may not be accomplished, but the design of it is achieved.

The day is near when the national head will appear in parliament or congress, to proclaim, with tragic mien, and sorrow-riven voice, that the nation is confronted with the dire necessity of having to fight for its existence. All nations going to war hear that same set speech. It is an old formula. Rameses II used it 1279 before Christ, and there is reason to believe that it will be used until diplomacy has become a mere wraith in history.

Other Side's Diplomacy Secret

SPELLBOUND parliament listens and, when the big man allows his hands to fall to his sides, rises to vote war credits and exculpate the government from all evil intent. Recent experiences are too fresh in the mind of the public to make it necessary to draw attention to what happens after that.

We then hear a great deal of the *secret* diplomacy of the adversary. The public does not stop to think that hitherto it was no partner in the international affairs of the country. Though the foreign office dig up documents years old, showing that there were crises and crises, it will not explain how it came that these difficulties were not aired at the time. Also at that moment the parliament has slapped on most efficacious War Acts, and questioning of the government after that is equivalent to high treason.

Reference has been made to diplomatic privileges. Some of them are no longer important. That the premises of the embassy and legation be placed under the fiction of exterritoriality is a mere courtesy these days, though still liable to abuse, as has been in the case of Mr. Lewis Einstein. The inviolability of the person of a diplomatist and his staff is a humane provision, and should be held in better esteem than the Entente and United States governments have recently done, though the modification should be made that the diplomatist is answerable for his conduct to the criminal law of the country in which he is stationed so that he may be reached in case he seduces the young females of the foreign community. To do that would be a step forward. As it is the diplomatist can not be held responsible for this and other acts, because the foreign government can not punish him, and his own government will not punish, because it can not admit that it had such an individual in its foreign service. All that happens is that the man is dismissed. As an example, it should be mentioned that Mr. Gerard, while in Berlin, threatened a man with arson. The man made a complaint in the courts, but the foreign office asked him not to press the case, because nothing more than diplomatic correspondence could come of it in the end. The foreign office could have given that advice a little sooner, and perhaps gained the eternal gratitude of Mr. Gerard, but it had an interest in parading this great diplomatist in all his splendor of intellect. That was the reason why the court took notice of the complaint in any form.

To diplomatic privilege belongs exemption from taxation, custom duties, inviolability of baggage and parcels delivered through the mail, and a few other favors not important enough to be named. The great privilege, however, consists in the permission to the diplomatist to use a secret code, and to maintain his own postal service. The function of the diplomatic courier consists of convoying the diplomatic mail pouch, in the recesses of which may be hidden the very secret treaty which later encompasses the ruin of the country through which the courier carries it. In diplomacy that is an everyday occurrence.

Routine dispatches of the diplomatist, especially those for which some private person pays the tolls, are transmitted in what is known as *texte clair,* or plain, legible words. Official communications, however, are first drawn up in text, then they are handed to the code clerk who transcribes the message into code. They are delivered at the telegraph or cable station in that form Upon arrival the code telegram is turned over to another code clerk, who proceeds to decode it. The "clear text" is then turned over to the official to whom the message is addressed. For "special" and "strictly confidential" instructions there is usually a special code, and very often that is not in the possession of the code clerk, but is held by the ambassador and minister for foreign affairs themselves.

On the Theft of Codes

MANY an interesting piece of fiction has been written about the theft of codes. The fact of the matter is that the possession of a code book means nothing. That sets of five numerals identify sentences and parts of sentences does not justify the conclusion that these sets of numerals have always the same meaning. As a matter of fact they never have the meaning of the words placed in conjunction with them, so far as the cyphers in the telegram are concerned. Governments go no longer to the trouble of stealing one another's code books, because to do that is now no longer profitable. It is the key to the code that determines what the cyphers mean, and since that key may change with each week, or day, even, it would be an utter waste of time to inquire into the matter.

The system is best explained by a demonstration. Let us assume that on a certain day there had arrived at the American embassy at Vienna a cypher cable from the State Department containing the following: "Amembassy, Vienna.

"65743 85472 63219 73241 54578 89765 84327 Ancona 94578 58782 64327 54898 54937 99819 56782 59327 59334 58733."

Assuming that the Austro-Hungarian government had been in possession of a United States diplomatic code, its foreign office could have obtained a copy of the dispatch from the telegraph office, and, setting one of its code clerks busy, it might have had the following garble of words:

65743 should be guarded against in the future
85472 informed me this morning that
63219 situation needs immediate
73241 the minister for foreign affairs said that
54578 has not yet returned
89765 fall of the ministry is near
84327 result of the recent election was
Ancona "'Ancona"
94578 faced by a deficit
58782 departed yesterday for
64327 a rapprochement between
54898 upon his return last
54937 his statements were unclear
99819 Royal government of Siam
56782 will return on
59327 no further steps will be taken until
59334 present situation is not to be considered critical
58733 attitude is hard to understand

From that jumble of terms the ministry of foreign affairs could learn nothing, of course, but the case would be different did it know the key that was to be used in the decodization of the dispatch. The key for that day may be the numeral 1221. The code clerk of the embassy would retire into his office, lock it, if thought necessary, and the first thing he would do would be to subtract from the cyphers in the telegram the factor 1221. The result of this operation would be the following:

67543—66321 *Aides-mémoir.*
85472—84251 "You will inform (the Imperial and Royal Austro-Hungarian government) that
63291—61998 the reply to our note of
73241—71020 November twenty-first
54578—53357 in regard to the
89765—88544 sinking of the
84327—83106 Italian (Royal mail) steamship
Ancona 'Ancona' is
94578—93357 overdue and that an expression by the (Imperial and Royal Austro-Hungarian government) is
58782—57571 anxiously awaited.
64327—63106 Should the (Imperial and Royal Austro-Hungarian government) fail to
54898—53677 inform (the government of the United States)
54937—53716 what its attitude is
99819—98598 the government of the United States will
56782—55561 consider itself at liberty to
59327—58106 take such steps as it may deem
59334—58113 necessary for the
58733—57512 protection of its national interests."

The matter within parenthesis would be added by the diplomatic secretary entrusted with putting the finishing touches to the *aides-mémoire*—the ultimatum, for such in effect the document is.

By that time the foreign office would know that an "Ancona" note had arrived. Dispatches addressed to diplomatic posts and their personnel are carefully scrutinized by the government. Should it be deemed better not to have the word "Ancona" appear in the dispatch, then it would be omitted, of course. The code is quite ample, and the cyphers following the key combination of 63 will easily convey two and three letters of the alphabet, in which case "Ancona" might appear as 63924, 63829, with 9-a, 2-n, 4-c, and 8-o.

The Key of the Day

THERE is little danger of a foreign government learning what the key for the day is, since that information is generally in the keeping of a secretary. To make assurance doubly sure, the cyphers of the key may be in the keeping of two persons with the 12 here used quite useless until the 21 has been added to it. The code clerk may have one factor of the combination, and the ambassador the other. At any rate every precaution is exercised not to have an accident occur.

That code is used for the transmission of a note which will come to the attention of the government anyway, may seem useless at first. The question may be asked: What difference does it make that the foreign government learns from its agents in the telegraphic service that a diplomatic note has arrived?

Governments are unanimous in their determination to let the governed know as little as possible of their affairs. The use of cypher can be interpreted into a courtesy, therefore. Again, by sending diplomatic communications in legible text, publics the world over would unnecessarily fall from one spasm of excitement into another, since diplomacy does now and then clear out of the way, without bloodshed, the situations it creates—usually for a definite purpose.

There is a third party involved. Diplomatic communications in *texte clair* could be scrutinized by the governments of the countries of transit. Intrigues of the brand which recently led to the Great War could not be carried on, because the governments could place themselves in possession of the contents of diplomatic dispatches, and, on the other hand, it would be impossible to form combinations of powers that might be needed to trim some international bully. While such alliances could be decided upon at meetings or by diplomatic mail, it would be extremely difficult to make them effective, or keep them alive. Alliances are veritable scraps of paper when not constantly nourished by intrigues that make such understandings necessary. The Franco-Russian-British pact would have died a hundred times had not Messrs. Iswolsky, Sazonoff, Poincaré, Cruppi, Viviani, Nicolson, Grey, Asquith, Benckendorff, Buchanan, Paleologue, Rennel Rodd, Barrerè and scores of others done their best to feed the beast with new crises, and the Triple Alliance would have died the death of a rag doll had it not been that Aehrenthal, Berchtold, Bieberstein, Schoen, Lichnowskyy, Pourtalès, Jagow and Kuehlmann were never slow in demonstrating to one another how badly they would fare if separated.

Withdraw Right, He Urges

IT WAS the diplomatic code telegram that conjured up the great idiocy, and it is a certainty, of course, that it will serve again the same purpose.

What has been said here in favor of the use of code and other secret rigmarole represents the governmental attitude.

After all it really is better that the ambassador should hand in the ultimatum. To have the news of war leak out through the telegraph operator is not to be advised, naturally. To have other governments know that a crisis is on can not be tolerated. Nor would it be well to use the ordinary commercial codes, because they could be deciphered by anybody. We have arrived at an *impasse,* seemingly.

However, where there is a will there is generally a way. There is no valid reason why a government should not have its own code. But the chances for peace would be greater in the future, if governments insisted that no diplomatic dispatches could be forwarded when not put into the code of the government exercising juris-municipal jurisdiction at the sending point. The principle of exterritoriality of diplomatic posts would not be upset thereby. The telegraph office or cable and radio stations are under the sovereignty of the state, and that ought to suffice to meet all arguments. Parliaments can attend to that little matter by passing a law excluding from transmission by telelectric means all dispatches that can not be read by means of the government's non-public code, with incoming dispatches, and messages in transit, excepted.

The diplomatist can then receive instructions from his own government, as seems necessary in this imperfect world of ours, but he could not send electrically what may be his own wrong interpretation of the facts, or, as is only too often the case, a deliberate lie. To be sure, this expedient would not totally eliminate the use of code and cryptograms, but their employment would be too hazardous, and the risk of misunderstanding would be run to such an extent that no sane government would care to resort to that subter-

Wanted—A Faithful Friend to the Indian

Thus, in Plaintive Appeal, Blackfeet Look to Washington for Relief From Hardships and Adjustment of Their Claims

By EARL CHRISTMAS

THE Blackfeet are turning their faces again toward the great councils of the pale face at Washington. You see, there's a new President in the White House, and new men in the Congress, say the Indians, and so hope rises anew in their breasts.

In the plaintive way of the red man, a group of Blackfeet chiefs told me the other day of their hopes—and disappointments. It has been a long and discouraging fight these chiefs have waged for their people. In thick voices of gutteral eloquence, they told me that large numbers of their tribe, with little or no means of livelihood, are destitute out on their Montana reservation, or are the objects of private charity. But there's a new session of Congress now, and so the big chiefs of the red men are turning again to Washington for relief. They told me, too, of their fruitless attempts to get legislation through Congress settling claims for large tracts of land which they said they once owned, how they have been put off from time to time and action delayed from year to year.

Said one swarthy chief:

"It seems the government wants all the Indians to starve so it can get their lands for nothing."

The land claims of the Blackfeet Indians may be discounted in the councils of the white man. Legally, it may be right and proper to do so. The Blackfeet warrior, when he speaks of the destitute condition of his people, may even be charged with overzealousness. But his plaintive appeal nevertheless is significant as indicating how at least a portion of our Indians feel regarding their treatment by the white man.

Our treatment of the American Indian has not in all respects conformed to the highest conception of justice. Under the circumstances, it may have been difficult to have followed any other course, and most of the men charged with the administration of Indian affairs may have done the best they knew. But the fact remains that we haven't satisfied all the Indians, and some of them we haven't helped so much as we like to think. So the point of view of the Indian must at least be interesting to those who have a friendly feeling for the red man. Indeed, the Blackfeet Indians might contribute quite an eloquent commentary upon our policy of dealing with the Indians.

Chief Curley Bear, senior chief of his little band, was the first to speak when I asked the Indians about conditions on the reservation. Curley Bear, a rugged warrior of 85, twice has made pilgrimages to Washington to obtain relief for his people or seek adjustment of their claims against the government.

Curley Bear does not speak English, but Little Chief, a Carlisle graduate and highly accomplished, acted as interpreter.

Curley Bear began.

"I am very glad you have asked me this question," he said, through the interpreter. "It is something that touches my heart much."

We were sitting in a little, half-lighted room, the five chiefs decked in all the feathered costume and paint of the warrior, donned for some gala occasion. Curley Bear grew eloquent as he proceeded. The other chiefs sat about the room with immobile faces, the spectacle, in the half-darkened room, forming an appropriate setting for the words of the tribal orator.

"We are very poor," Curley Bear went on. "We have been wanting help for the last thirty years, and we can't find a man who is a true friend to the Indian to call upon for assistance in our destitute circumstances.

"The people on the reservation wish, if such a power is in heaven, that it will make us think of the man who can help us conquer the circumstances that make us helpless.

"I shall be very glad to have any man go among my people and find out for himself the conditions, so he may look into the matter and see what will be for the benefit of the Indians in the future. These Indians for two or three years have suffered for food and clothing.

"If it were not for Mr. Hill (L. W. Hill), we would all be starving. He is very kind to the Indians and gives them employment during the hard winter and summer, too. It seems the government wants all the Indians to starve so it can get for nothing all the minerals and gas and oil and coal under our lands. We know our lands are very valuable with these things I have mentioned. There are a great many white men who came to our reservation and took leases for gas and oil and coal. When these leases were sent to the Indian office, the government cancelled them.

"I don't see why they won't help us get something for our land for the benefit of the Indians in that reservation. Last winter was a very hard winter, and even the stock, the horses and cattle, all were starving. Over three-fourths of the Indians have no horses, and one-fourth of them might have one or two. And, these horses, they can't use. They are little horses, cayuses, who can't do hard work on roads and farms."

Little Chief then explained some of the difficulties of farming on the reservation. On the western portion of the reservation, the elevation is so high and the season so short that grain can't ripen. Wheat, barley, oats, potatoes and rutebagas may be raised in lower portions of the reservation, but with some difficulty.

"Each Indian got 320 acres of land," Little Chief explained. "Then under the new allotment, he got 80 acres. This new allotment was given as a homestead, and he can not sell it. When he becomes a citizen, he can sell the 320. Large numbers have sold the 320 allotment. You see, the majority are citizens now.

"Other Indians borrow money. They can't make living, and their stock is lost. So, they borrow money. Then they can't pay back the money, and the traders come and take their land. When we go to the Indian agent to help, to keep the traders from taking the land, the agent says, 'Can't do anything for him now because he is a citizen.' The agent seems to help the trader more than the Indians."

Little Chief, a Carlisle graduate and one of the ardent spokesmen of his tribe.

Chief Curley Bear, of the Blackfeet Indians, who seeks aid for his people. In the language of the Indian, Curley Bear is Kio-so-esch.

Curley Bear, somewhat impatient at the interruption, resumed his discourse in the tongue of the Blackfeet.

"The gas, oil and coal leases were turned down, I understand, because of the low price of oil," he said.

"What I tell you is all true. If any man doesn't believe it, he can go among the Indians and ask anyone, and I think he will say that the same conditions continue which I tell you about. Now, my son, I call upon you to help us. The Blackfeet have one of the biggest claims ever presented pending before Congress. It has been pending for the last fifteen years, and we can't get any help. The claims are based on the treaty of 1855.

"Bills were introduced, but they never passed. When we can get our delegation to Washington, we will re-introduce the bill. We want to get this matter investigated thoroughly before Congress. It seems that the government wants to wait until all those who were present at the time of the treaty are dead and no one is left to represent it. Then the government can say, 'This claim can't be allowed; it can't be taken up unless someone is living who was present when the treaty was made.'"

Little Chief explained that the chiefs wished to go to Washington to continue their fight for their claims, but that authorities had said they could not make the trip.

"We have no money now," he said. "The agent says we have no money to travel. Congress is ready to take the claims up again, but we can't go down to fight any more. The agent says we can't go down. I don't know what we are going to do.

"Before the war, Congress was about to allow the claims. Then the war started, and everything was dropped except the big things. Now we are getting ready to try it again. We have a man down there now handling the matter, and he has sent word that we should come on with the delegation, but they won't let us go down."

Little Chief says that the Indians hope to obtain $1.25 an acre for a tract totaling 62,000,000 acres, under what is known to the Blackfeet as the treaty of 1855. Members of the tribe who were present at the time the treaty was made still are living, he says, and will go to Washington if possible to aid in establishing the claim.

Chief Big Spring likewise made an appeal for his people, affording, too, an unusual slant at the point of view of the Indian.

"I call upon you for help," he began, Little Chief acting as his interpreter. "I have been looking for a man who will investigate our destitute condition on the reservation. This winter we needed much help. We thank the Red Cross which came to our reservation this spring and helped all the poor Indians, and gave them clothes and food. Mr. Hill is another man who is a great friend of the Indian, and he helps them any way he can.

"Half of the Blackfeet Indians are starving on account of the government not trying to help them. I call upon you to call upon some one who you think is a true friend to the Indian in every respect to let this representation, consisting of five men, to go to Washington and try to help the old people and to present the bill we have in past years to get money for our land under the treaty of 1855. Many of the Indians would have starved but for the Red Cross and different lodges, which collected gifts for them.

"The new agent, Mr. F. C. Campbell, seems to be a very good man to the Indians. He tries to help the Indians raise grain so in every home there will be some for winter, but we do not know how he will be in the future. At present, he talks very kind and helps all he can. If he is true friend to the Indians under his charge, he will be great help, but if he fails, in food or clothing . . . .

"I should think that with another hard winter, all the Indians will starve, and for that reason before winter sets in we want to have some help.

"Now, here is something else that puzzles us, and that is about the Indian traders. It puzzles us about their prices on groceries and dry goods. Since the war started, or before, they raised the prices on groceries and dry goods, and they keep raising. We understand that in the cities away from the reservation, that is in the East, prices have gone down. Instead of that, they are getting higher on the reservation right along. Many of the traders in Browning are robbing the Indians, and in the past, our agents, it seems, have failed in helping us get anything cheaper.

"Now, I hope you will call this matter to the attention of some of the true friends of the Indian, so we can go to Washington and help our starving people."

With that the chiefs shook hands with me—not by taking the tips of the fingers, but by grasping the forearm and shaking arms like true friends, they explained—bowed very low and went out to do a war dance for which they were scheduled as an entertainment.

The Blackfeet once were very powerful and ranged over quite a wide territory north of the Missouri and east of the Rocky Mountains. A scourge of smallpox in 1840 decimated their ranks severely, and they dwindled in numbers until there were but 2,700 at the time of the 1910 census. Now, there are less than 2,000 members of the tribe left, according to Little Chief. Having lands unsuitable for farming and being by temperament indisposed to undertake it, the Blackfeet never have made great progress in this line. The government has sought to encourage stock raising, but only with partial success. Due to lack of feed, mismanagement or misfortune of one kind or another, the Indians have lost many of their animals.

The government has made arrangements to provide rations of food and clothing to the aged and sick among the Indians, but this is wholly inadequate, according to the chiefs. They complain, too, that the regulations of the service frequently work hardships. The able-bodied Indians were expected not to need help. One case in point was that of the wife of an Indian who was killed. She received the allotment and was presumed to be able to make her living from it. An able-bodied man might, but this woman could not.

But relief measures for the Blackfeet Indians are pending in both houses of Congress now, and more liberal provisions for the needy may result. But for the settlement of their claims for lands, the Blackfeet may have to wait for some years more, and possibly meet with more disappointment. Officials at the office of Indian affairs, Department of the Interior, said that the claims of these Indians had not been formulated and officially the department had no knowledge of their nature.

But anyway, the Blackfeet are ready to take up the trail to Washington.

The Dominions and the Anglo-Jap Treaty

Belief Prevails That Britain's Colonial Possessions Bordering on the Pacific Ocean Will Be Heard Before One Is Signed

By W. P. CROZIER

Manchester, England, June—(By mail).

MUCH the most important of all questions to be discussed at this year's gathering of the British premiers in London is the renewal of the Anglo-Japanese Alliance. In the normal course of events the alliance would have been renewed last summer, but it was announced that the renewal was postponed because some of the phrases of the treaty might be found to be incompatible with the Covenant of the League of Nations and it was thought that during the next twelvemonth the two powers might be able to adjust the language of diplomacy to the needs of the covenant, with which all its signatories must square their treaties and conventions.

This was the reason assigned but it is generally believed to have been but a pretext. The real ground for postponement, it is thought, was that the British Government would not, and felt they could not, renew a treaty affecting vitally the fortunes of the Pacific Ocean without consulting the British dominions that lie about its borders. (We shall see later that consultation of an altogether non-British party, the United States, is by no means beyond the bounds of possibility.) The premiers, therefore, will render their opinions shortly—Mr. Hughes for Australia, Mr. Massey for New Zealand, Mr. Meighen for Canada (these are the three countries most concerned) and General Smuts for the Union of South Africa.

Dominions Are Now Consulted

THIS is not a wholly new departure within the British Empire, but the dominions have never been so formally and fully consulted before on any great single issue of foreign policy. The treaty-making power for the Empire lies with the king, or, in other words, with the Imperial Government in London. Whether or not the government renew the Japanese treaty, they must, in a technical sense, bear the sole responsibility. Even in 1911, when the alliance was last revised and renewed, the dominions were consulted on one or two points in it, but events have moved so fast since then that no Imperial Government dare now renew the alliance without the formal approval of the British dominions. The alliance was originally made and renewed regardless of what opinion the dominions might hold, but now it affects them too intimately in several ways for such a course even to be conceivable:

1. Japan has become a great Pacific power, stretching out to the islands near the equator, so that Australian public opinion is demanding the establishment of British naval stations between the new Japanese possessions and the northern coast of Australia.

2. Not only is Australia nervous of the Japanese pressure southward toward her shores, but Australia herself has expanded northward into some of the former German islands—the German part of New Guinea, for instance—which she now entirely controls. There is talk even of a new British dominion—the Dominion of the Pacific Islands. This expansion brings Australia and Japan into much closer contact and intensifies Australian anxiety about the teeming millions and the strong and highly trained Japanese army and navy.

Australia's Gates Are Closed

3. The dominions, like California, have always before them the problem of Asiatic immigration. Canada has the problem in British Columbia and has solved it by an amicable agreement with the Japanese. Australia (and New Zealand) simply will not have colored immigrants at any price. A "White Australia" is the fixed and unalterable policy of the Commonwealth. With a small white population (five millions) dotted here and there along the fringe of an enormous continent, they cannot but believe—and they do—that the sixty millions of Japanese, not to mention the 400 millions of Chinese behind them, industrious, frugal and intelligent, must look longingly on the forbidden land and resent their exclusion, with the secret determination sooner or later to force the gates of the proud and selfish but numerically feeble white men. These apprehensions have been quickened by the events of the Paris Peace Conference, where Japan put forward her claim to equality with the white man. Mr. Hughes, the Australian premier, then explained that he fully recognized the equality of the Japanese and would do anything to show his recognition—except, of course, admit them to his country. On that neither he nor any Australian will budge and they will not have the Japanese treaty if it involves by a scintilla the modification of their fundamental policy.

4. The greatest country that looks on the Pacific Ocean is the United States, and there is friction in the Pacific between Japan and the United States. There is the trouble over Yap. There is the old controversy about Asiatic immigration into California. There is the question of free American communication with the Philippines now that Japan holds so many of the ex-German islands. There is the alteration for the worse in the stragetic position of the American island of Guam, now surrounded by islands in Japanese possession. There is the competition in naval armaments, as the world begins to see it—as Europe certainly sees it—between the two great powers. There is, in short, the possibility of serious trouble in the future—may it never come!—between America and Japan. The sympathies of the British Dominions are admittedly with the United States. They hope for, and count on her sympathy in their difficulties. They believe she is a safeguard to them in their apprehensions, if those should prove not to be baseless. They will do nothing, and consent to nothing, that might offend her. That is one of the foundation stones of their policy and they will declare it at their meetings in London this month and next.

We are often told over here that there prevails in the United States a widespread belief that somehow or other England might be involved by the Japanese treaty in war with the United States. Such a thing is, in reality, inconceivable; neither in England nor in the dominions would public opinion tolerate it; it is specifically provided against in the treaty of 1911; and the Japanese recognize and admit the fact. In 1911 England was engaged in negotiating a treaty of general arbitration with the United States which was expected to go through. In the event, it was rejected by the American Senate, but in the meantime England has caused the following clause to be inserted (with the approval of the dominions) in the revised version of the treaty:

IV. Should either High Contracting Party conclude a treaty of general arbitration with a third power, it is agreed that nothing in this agreement shall entail upon such contracting power an obligation to go to war with the power with whom such treaty of arbitration is in force.

Don't Want to Antagonize the U. S.

BUT the treaty of arbitration fell through? Yes, but in 1914 the two governments signed the Peace Commission Treaty under which they agreed to refer all disputes to a Permanent International Commission. The British Government thereupon notified Japan that it would regard this treaty as equivalent to one of general arbitration, so that clause IV automatically came into operation and there could be no excuse for supposing that the treaty might bring England into war with the United States.

Such is the present position and now let us see what the dominion premiers have been saying about the renewal of the treaty. I doubt whether either in America or in England it is fully realized how remarkable is their agreement about the conditions on which, and on which alone, the treaty should in their opinion be renewed. A few quotations will make it clear. Except for Mr. Meighen, the Canadian premier, they have all defined their positions clearly within the last few weeks to their own parliaments.

Canada—A Reuter telegram which was dispatched on Mr. Meighen's departure from Quebec and is clearly little removed from an official communication, says: "It is understood in reliable quarters that Mr. Meighen will support the renewal of the treaty only on condition the treaty is satisfactory to the United States. Under existing circumstances it is believed he will be influenced by evidence proving that such an alliance would serve the best interests of the British people. The majority of members of the Canadian House of Commons hold the same views, with the stipulation that the treaty should be executed so as not to antagonize the United States nor impair British chances of greater friendship with the American people."

Australia—Mr. Hughes, unlike Mr. Meighen, has given his opinion bluntly in a memorable speech in which he reaffirmed Australia's intention to exclude the Japanese and hinted not obscurely that he would like to see the United States entering into a Japanese-English-Dominions treaty. This is what he said:

"There has lately been much talk of strained relations between the United States and Japan. Now in that lie the germs of great trouble and possibilities of infinite disaster to this world. What is the hope of the world? As I see it, it is an alliance and an understanding between the two great branches of the English-speaking peoples. Now here is our dilemma. Our safety lies in a renewal of the Anglo-Japanese Treaty. (Note Mr. Hughes' remedy for his fears—to make Japan harmless by having her as an ally, just as Italy for the same reason joined Austria in the Triple Alliance.) Yet that treaty is anathema to the Americans. Our ideal at the conference is, as I see it, a renewal of the Anglo-Japanese Treaty in some such form, and modified, if that should be deemed proper, as will be acceptable to Britain, to America, to Japan and to ourselves.

"We desire above all things to live in peace and friendship with Japan. It is utterly wrong for the Japanese people to think that because we have passed certain laws we regard them as our inferiors. We do not. But while we are friends of Japan, we do not always invite our friends into our house. We have our ideals, they have theirs. We say, 'This is our country; Japan is yours. We shall treat you with courtesy. We desire your friendship. We want to trade with you, but we cannot go any further.'

Must Be Agreeable to America

"IT IS the bounden duty of Australia to use every means at her disposal to effect such a *modus vivendi* as will secure a renewal of the Anglo-Japanese treaty in a form agreeable to the United States. Whether she is a party to it or not is not material, so long as she accepts it, and does not regard the renewal of it as being in itself a hostile act by Britain directed against herself. While making every effort to retain the friendship of Japan, we cannot make an enemy of the United States. Nor can Britain do so."

New Zealand—Mr. Massey emphasizes the immigration question. "So long as we insist on, and maintain, our right to choose our fellow citizens in New Zealand—and we have the most stringent immigration law in the world—we have much to gain and nothing to lose by the renewal of the Anglo-Japanese Treaty. The Japanese were perfectly loyal to us during the war. We owe them a debt of gratitude. That does not, of course, imply any change in our attitude as regards immigration into our country."

Mr. Massey does not himself mention the American aspect of the question but press telegrams from New Zealand to England state that public opinion in the dominion is willing to accept the treaty provided that immigration is not affected and that the interpretation of the treaty is not such as to raise the slightest risk of embroiling Britain with the United States.

South Africa—General Smuts delivered his opinion to the Union Parliament on May 20. "The paramount consideration," he said, "that they ought to keep before them was that it was essential as far as possible to secure an understanding and co-operation between the British Empire and the United States. The essential policy for the British Empire was to work with America."

All Want to Co-operate

THESE pronouncements have not been estimated at their proper significance, which is immense. We are in face of a new phenomenon in international politics. The British dominions fronting on the Pacific (and with them South Africa) openly declare that the essential element in their policy—and, as they would have it, in that of the empire—is co-operation with the greatest Pacific power, the United States. It need not be, and as Mr. Hughes' speech shows, the dominions do not desire it to be, an exclusive co-operation hostile to other powers. It would be a great mistake to convey to the rest of the world that the English-speaking peoples are ranged together, in the Pacific or elsewhere, with any sort of implied opposition to other peoples. But they may fittingly co-operate in the pursuit of principles which they hold in common and welcome the assistance of any country that will join with them in the pursuit. Co-operation of that kind there will clearly be and the desire for it could not be more publicly and solemnly announced than by this general conviction that England ought only to renew the Japanese alliance if it does not in any way prejudice the prospect of acting along with the United States.

By the bare announcement, the problem of the Pacific has taken on a different aspect from what it wore only a few months ago. It has become simpler and at the same time more serious. The prospect of a peaceful future is increased but so is the danger of racial division. The English-speaking peoples are gradually coming together in the Pacific to face an incalculable future.

NOTE:—The Conference sessions already held bear out much of what Mr. Crozier has written here.

Do You Put Your Jewels in the Top Dresser Drawer?

By JAMES C. MURNANE

This is the second of two articles by Mr. Murnane, who until his death a few days ago was Chief of the Bureau of Identification, of the St. Paul Police Department.

WHEN it comes to helping the men who rob us, the average householder takes a high rank. Many homes continually hold out invitations to the burglar, and even when they are not so openly helpful, men and women are always leaving their valuables in places most convenient for the thief.

One of the greatest fallacies with which the general public is obsessed is a false belief in the security of the lock on the door. Why, some persons won't put their money or valuables in the bank, but will keep them in the home, with just an ordinary lock on the door.

You can't depend upon the lock on your door to safeguard your valuables. If I could make everybody see that, a lot of burglars would have to go out of business. Then if I could prevent people from doing some of the foolish things they do with their valuables, some more burglars would be seeking new vocations. But to get back to locks—you may have a patent lock, with all the frills of the locksmith, and a reassuring sense of security, but that won't insure the safety of your gems — if if you leave them in places that are handy for the thief, as so many people do.

The man who gets too deeply interested in his evening paper is one of the easy victims of the pickpocket. The picture, posed by detectives, shows how the pickpocket may cross his arms, being careful not to move that nearest the victim, while he takes the money with the other hand.

People lock their doors and think they are safe. Now practically there isn't a door nor a window that a good burglar can't open if he really wants to get in. Why, they get out of jail without any tools. They certainly can get into a house just as easily. And it is all the same, whether it is a door or a window. As an expert on locks, the burglar, or the "prowler," may be quite as good, or a little better than the man who made the lock.

Here is something that a great many people do not know, though it is exceedingly simple when you come to think of it. Lots of persons will lock their doors at night and leave the key in the keyhole, imagining that its presence there will keep the burglar from inserting his key and unlocking the door.

Now a key in the keyhole doesn't bother Mr. Burglar one bit. Every high-class burglar carries a little instrument for just that purpose. It consists of a small pair of nippers that will slide into the keyhole and fit over the end of the key. Then the prowler can turn the key either way, unlocking or locking the door without removing your key.

But here is one way that will give them trouble. If you take a piece of wire, run it through the ring in the end of your key and draw it tightly around the doorknob so that the key can't be turned around, Mr. Prowler has a harder job. Also there are some door catches that help.

But even with these precautions, the burglar can get in if he really wants to very badly. If he finds the key fastened so it won't turn, all he has to do is to bore a small hole through the door. A sharp pointed blade of a knife with a curved edge will drill a hole through the soft panel of the ordinary door in but a turn of the wrist. All the fellow has to do then is to cut the wire to the key and unlock the door. Sometimes they use an augur, and bore right around the lock.

Speaking about getting into doors, there's hardly a chance to keep a good burglar from getting into any of them. For instance, take one of the well-known patent locks that has been advertised much. Open up your door, and note that you can push the tongue of it back into its socket.

Well, the burglar takes a thin instrument like the blade of a knife and inserts it into the crack of the door, striking the beveled edge of the tongue. He pushes on the tongue, and it slides back into its socket and presto—the door is open.

The ordinary door bolt would appear to be fairly safe, but it isn't. The "prowler" takes a small hacksaw—no, he doesn't cut the bolt. He uses it to turn the bolt and work it back out of place so the door will open. Windows are opened just as readily.

"Prowlers" often enter homes as peddlers or solicitors. A well-dressed man may knock at the door of an apartment. The woman may be afraid and start to close the door, but he sticks his foot in the door—oh, they are bold all right—and goes ahead with his talk about whatever he is selling. Meanwhile he makes the best of the opportunity to look about for any valuables that may be in sight.

That is the way thieves find out about homes they rob, or at least it is one way. The man who goes out first is the "locator." He rarely does the stealing himself, but he furnishes the information to his companions who do the work. Sometimes, the thieves pick their mark by seeing a man show a big diamond in public, or a big roll of money. If the prospective victim is a business firm, the burglars may even send a member of the gang to the place in the rôle of a business man. While attending to some minor business, he finds out the kind of safe in use and notes the probable amount of cash they might expect.

But it is in the home that we are most apt to be helping the burglar out when we don't know it. Now here is one rule that I'd like to put up in every home in the country — Don't put valuables in the top drawer of anything. Women invariably put their valuables in the top drawer of the dresser, or they even may leave them lying on top of the dresser. The thief looks in these places the very first thing. You see, the thief has learned a bit about human nature, and the rest of us who own the jewels have been slower to learn. Often we think we are original, when we may be doing just what the other fellow is doing.

Locking gems in your trunk is about the same. When you do that, you invite someone to steal them. Every good thief carries keys that will open any trunk, and a locked trunk is one of the first places he will search. You see, he knows something about human nature.

Don't take earrings or rings off in a washroom and lay them down if you expect to see them again. Constantly we have cases like that. When you are traveling, always keep your gems on your person, or else check them with the clerk or purser. Never show jewels in public places like cafés.

Some people sleep with their diamonds on, and there is some sense in the practice, too. Thieves robbing a house will avoid the persons in it, fearing to awaken them. However, the best way is to have a safe for furs and valuables. Many homes have steel safes and vaults, and you never heard of anybody cracking a safe in a residence. Of course, a safe can be cracked but usually the man who "prowls" a residence hasn't time, and the safe cracksmen, anyway, play for bigger game. Another wise precaution is to put your valuables in safety deposit vaults in banks. The safety deposit vault might profitably be used much more than it is.

Burglar alarms also are valuable, even though they are only noise makers. Noise is a mighty effective weapon against the burglar, because he knows that the noise will awaken the family, and no burglar with his sense about him will stay long in such a house.

Now, here is another thing that it is well to consider. Scores of families, when they go away for the day, pull down all the blinds tightly, as if the house were closed for the summer. That in itself is an invitation to the burglar. Then when the family goes downtown for the evening at the theater, invariably all the lights are turned out. That is another eloquent sign for the house "prowler," who likes to call while you are away. Even if he hasn't seen you go out, as may very probably have been the case, the darkened house speaks louder than any other message you could leave.

Now, if you should leave one or two lights burning, there would be less chance of your having visitors during your absence at the theater. The thief won't be able to tell whether there is anyone at home or not then, and no thief is going to take a chance of entering a home when someone may be in it, and awake.

In spite of all precautions there will be robberies, only you would be surprised to find out how many of them are due to the carelessness of the victims themselves.

Within the Sacred Precincts of Diplomacy

Concluded from page 12

fuge. The practice established by the Wilson Administration, in the case of the Austro-Hungarian, German, Bulgarian and Turkish diplomatic posts in Washington, ought to be continued.

The operation of this method will be outlined in the following chapter, but here it should be stated that it consisted of the *modus operandi* here described, except that it was one-sided, and left the diplomatists of the United States in the full enjoyment of their codes, if that term be understood. The diplomatists of the Central Powers group of belligerents wrote their dispatches in plain, legible texts, handed them over to the Department of State, where they were converted into United States code, to be then transmitted to the embassy or legation in the capital in question, decoded at the United States embassy or legation, and then handed to the foreign office. The results of this practice were inimical because the United States diplomatists passed into complete control of the international situation—at a time when this country was not in the war—and the limitations and handicaps imposed upon the diplomatists of the Central Powers made it impossible for them to inform their governments rightly—even when they had the inclination.

There would remain the inviolability of the diplomatic pouch. There seems to be no reason why that should be attacked. *La nuit porte conseil.* The letter written today and read tomorrow is often rewritten or not sent at all. The thing which seems so absolutely necessary one day, has seldom the same aspect of urgency and imperativeness on the next.

Diplomatic telegraphing shares many characteristics of vice. The dispatch is gone, in a few hours it will have been read by the minister for foreign affairs, who, not knowing any better, takes alarm, and telegraphs to other diplomatic representatives of his. Within a day the *faux pas,* the views of an alarmist, the version of the exaggerator, the fabrication of the *agent provocateur,* the web of the liar, may be the stuff of conversation in all the foreign offices and chancelleries. The damage is done and usually the author of the *affaire diplomatique* can not be made to retract a word of what he telegraphed. Instead he telegraphs more, to save his reputation and position, and finally the matter is submitted to the arbitration of war. Governments are predisposed to believe their own agents, as is but natural. No matter what the inculpated government may do, the impression falsely made can not be eradicated. Diplomacy has the motto: *Qui s'excuse s'accuse.*

It is nothing unusual to have ambassadors spied on by the military and naval attachés, commercial attachés and even the secretaries. Since these emissaries have the right to use the code of the post, *chefs de mission* with the instincts of decency not wholly killed in them have often made the discovery that they were recalled from their posts because some jingo minister for foreign affairs, or chauvinist chief of general staff, thought them entirely too peaceful, as witnesseth the case of Count Metternich in London, whom the war clique in Berlin sawed off on account of his popularity at the British capital.

With the code eliminated, all these conditions would belong to the past, and mankind could look with some assurance into the future. Haste makes waste, they say, and of the modern speed mania it must be said that it leaves man no time to think in the realm of alternatives and ultimates. The diplomatist with code and telegraph constantly inviting him to be rash is forever tempted to diagnose from the first symptom he discerns. In the foreign office they decide upon the operation, and each time the march of progress is halted and the world set back.

The ideal state is to have no diplomatists at all. The case-hardened adherent of the present system says that this is not feasible. Yet the fact is that many of the smaller states get along very well that way. The Transvaal had just one diplomatic agent in all of Europe, Dr. Leyds, who had no trouble at all attending to the affairs of the Boer republic. He was stationed in Brussels, and from there conducted what correspondence was necessary. He used an ordinary commercial code. The Orange Free State employed a similar system.

As a matter of fact diplomacy is somewhat of a craze. Rich men like to see themselves as Excellencies, and there attaches to the *métier* a glamour and so much fuss and feathers of a social nature that even the governments that could take a stand against this medieval custom are persuaded by the social climber to turn a deaf ear to the attempts to lay the ghost of Metternich once and for all time.

And where can they shine better than in the *monde diplomatique?* In times of peace the life of the ambassador is one round of kaleidoscopic enjoyments, *Monsieur l'Ambassadeur et Madame l'Ambassadrice* are most welcome in the *salons, Vous savez!* It is so very charming, you know, to meet then only the people of one's class. No longer is it necessary to mix with the banalities of existence. None but the sanctified and annointed dare invade the precincts of His or Her Great Effulgence. And one finds such excellent chances to marry off one's daughters to men not mere commoners. One is presented at court, and at the levees of *Monsieur le presidente de la republique,* one finds the very *crème de la crème de la capitale.*

His Excellency, meanwhile, is afforded the opportunity once more to fling himself into *la vie d'oree.* While *madame* is in the country, the old chap, pleading pressure of business, stays on post, goes to the race tracks. There is balm even for the sad thought that ultimately all this will come to an end. There will be a successor some time. But forever and aye the folks back home will have to associate with the persons of M. and Mme., the ambassadorial couple, the thought that they belong to the diplomatic world.

BRIEFLY TOLD

Millions of pounds of picric acid accumulated for war purposes and made useless to the War Department by the armistice, will be distributed to farmers for agricultural purposes. This acid is a highly crystalline powder, lemon colored, and eighteen per cent stronger than forty per cent straight nitro-glycerine dynamite. It is never used in bulk but in paraffined paper cartridges.

Spain has introduced infirmity and old age pensions for workers.

As a result of the present crime wave Paris policemen, for the first time in history are permitted to carry revolvers in the daytime. Heretofore the police have carried little swords during the daytime and revolvers only after nightfall.

Bullfighting is becoming popular in France. New rings accommodating thousands are being built.

Proving the intense penetrating powers of X-rays, a French scientist produced photographs of human bones which were taken across a courtyard 250 feet broad and through a thick brick wall. This clearly showed the necessity of proper protection when using the powerful rays.

A Yale forestry professor is authority for the statement that alcohol can be economically manufactured from the moist vegetation of tropical forests and jungles. Alcohol has been distilled from the nipa plant in the Philippines at a cost of about twenty cents a gallon. Had the plant been operated at full capacity it would have cost less than fifteen cents a gallon.

Canada, during the past twenty-five years, has lost sixty million dollars annually through failure to segregate properly platinum and other precious metals of that group found in Northern Ontario.

A baby whale swam through the narrows into New York Harbor recently and while it lay upon a sand bar off Staten Island, two men, one with a shotgun and the other with a carving knife, killed it.

A shopkeeper in Orient, Long Island, has advertised his place by placing buffalo nickels in the concrete sidewalk in front. The Indian head is up and each head faces in the same direction. The coins are placed close together and spell out "Wigwam," the name of his place of business.

The heat was so intense in Washington, D. C., recently, that a Kentucky representative won a bet when he said it was hot enough to fry eggs on the steps of the Capitol. The eggs were procured and the heat slowly fried them.

Large signs in black and white bearing the inscription, "Private cemetery across the bridge for reckless drivers" and decorated with skull and crossbones have been erected on both sides of the Otterkill bridge on the state road between Goshen and Chester, New York. Many accidents have occurred on the bridge in the past and they were put up as a warning to careless motorists.

For the first time in its existence the New Hampshire *Gazette,* which boasts of being the oldest weekly newspaper in this country, did not appear June 18 because of the compositors' strike. Its first issue was October 7, 1756.

Narcotics are pouring from across the Rhine into Paris to such an extent that it has drawn a cry of alarm and protest from the French Academy of Medicine. Airplanes drop five or ten-pound packages at pre-arranged spots and agents in automobiles distribute the drugs.

Mexico is claiming several groups of islands off the California coast, among them being Santa Catalina, owned by William Wrigley, the chewing gum manufacturer.

Two bandits in evening dress are operating in Miami, Florida.

The New York state health department warns children against the pastime of making miniature balloons from the ruptured rubber ones by sucking or blowing against small pieces of the rubber held against the lips, because the dyes used in coloring the balloons are poisonous.

Two ex-service men led a crowd of several hundred persons in an attempt to lynch a Brooklyn truckman who wrapped a chair in an American flag when moving a company's office furniture. The truckman was held in bail for examination.

As part of the campaign waged by the Federal and state upon the camphor scale, which threatens to destroy much vegetation in New Orleans, residents of that city are required to obtain a certificate when they wear flowers, showing that the blossoms are free from insect pests.

In the famous Soho district of London there is a restaurant where guests are able to select their fish alive from a glass tank in the center of the dining room. Guests are furnished with fishing tackle if they desire and can have the pleasure of catching their own whiting or trout. Through a glass screen separating the dining room from the kitchen the fish can be seen cooking on a Tuscan spit, which revolves over a wood and charcoal fire.

Footprints, believed to be one hundred and thirty years old, of a Hawaiian army that fled from the wrath of the volcano Kilauea, Hawaii, have been found in the Kau desert, south of the great crater, by a professor in charge of the volcano observatory. Thousands of tracks in the volcanic ash, all pointing in the one direction, deep at the toes and light at the heels, indicate that the inhabitants had been running at top speed.

A French inventor has perfected a tank which resembles the ordinary whippet tank except that it is propelled from the stern. It crosses trenches, climbs walls, enters water, cruises on the surface, dives and crawls ashore along the bottom, according to French army officers who recently witnessed the performance.

A noted Chinese horticulturist has produced, on his estate in Florida, a remarkable variety of citrous fruit, a perfumed grapefruit. The fruit, when placed in a room, permeates the air with an odor unlike that of any citrous plant. Only one tree of the variety bears at present.

Wood carving by special application of the sand blast is giving satisfactory results, especially when used in connection with redwood. Protective stencils cover portions of the surface which leave figures in relief and a uniform background.

Five of every one hundred men in Europe are in the army, according to the British war secretary. The nations least able to support armies are those having the largest.

Washington game wardens are using electricity to prevent fish from ascending the irrigation canals. An automobile magneto driven by a water-wheel generates electric current which is conducted to a series of terminals beneath the water on both sides of the stream. Fish coming in contact with the "line of fire" receive the current and back off.

A corps of confidential clerks opens the President's mail and such communications as the President ought to see are briefed and a written synopsis of its contents and the writer's name are pinned to each letter. Requests for charity are so numerous that a special "form" is used in replying. Letters from persons on the same subject are bunched and the arguments pro and con are briefed.

With baggage consisting of two letters dealing with her father's war record, a three-year-old girl recently made a trip from her home in Glasgow, Scotland, to the home of her uncle in Swift Current, Saskatchewan, with only the kindly directions of steamship officials and trainmen to guide her.

A Tokio cablegram says that many old men in Japan are flocking to the Imperial University in quest of the "elixir of youth." The university claims that goat gland treatments are successful.

There are three hundred and ninety homesteads in Alaska, a small number compared with the opportunities.

A late Paris style is feather shoes. For the fall trade evening shoes are to have toes tipped with little plumes and paradise feathers are to be on the buckles.

More motorcycles are in use in London and all England than automobiles or other automotive vehicles, according to registration certificates.

In one year more than two hundred and fifty-two million persons arrived in New York City by train.

A Vermont judge fined his daughter when she appeared before him charged with violating a city ordinance. Court attachés said the judge later wrote a check for the amount of the fine.

The Wooden Fleet in the James River at Claremont, Virginia.

How Shipping Board Is Ridding Us of Ships

Ocean Steamers Sold for the Price of Twenty-Foot Pleasure Craft

SWINGING at anchor in the James River, off the little village of Claremont, Virginia, are more than 250 huge ocean steamships. To make possible the construction of this great fleet, more than two million persons of this country saved and sacrificed to buy tens of millions of dollars' worth of Liberty bonds, because we "needed ships to win the war."

Claremont, Virginia, is little more than a "four corners," and seldom appeared in the date lines of the news of the day until this great fleet of ships made the little Virginia village its home port.

A few weeks ago, in Claremont's pool room, there gathered in the afternoon a little group of men. That little group was a delegation of visitors, who mouthed a jargon which the natives of Claremont had difficulty in understanding. But the visitors understood each other. Perfectly. One who overheard their conversation reports that it smacked of "how much money it *vill* take" to do this, and "how much *eggspense*" it would be to carry it out. The conversation dealt solely with the great fleet of ships that lay, in units of nine, a few hundred yards off in the James River. The speakers, for the most part, were short, swarthy individuals and their type is to be found wherever there is trading, and speculation—and profiteering. New York knows the type best of all.

During the conversation one of the group was overheard to say that after "the boats are *sdripped*, they could be towed up to the flats and burned down for the metal in them."

Who were these men who discussed so calmly the fate of that great fleet of steamers, each of which had cost the American people at least $300,000, and in many cases as much as $800,000?

* * *

An Associated Press dispatch, dated Washington, which appeared in the daily papers for Monday, August 22, carried the following information:

> *Bids of $2,100 each* for 205 wooden vessels, submitted by the Ship Construction and Trading Corporation of New York, have been accepted by the Shipping Board . . . . Under its (contract) terms the board will receive 15 per cent of the total sale price of $430,500 in cash, and a pro rata portion of the balance on delivery of each vessel . . . . *The vessels cost the board from $300,000 to $800,000 each.*

Whether the foregoing bears any relation to what is to be set down hereafter is to be left to the judgment of the reader.

* * *

The story of the governmental twin war babies, the United States Shipping Board and the Emergency Fleet Corporation, or the vicissitudes these four billion-dollar twins have suffered, never has been related in detail. It never will be. And in addition to the fact that the story never has been told with the completeness it deserves, let it be said that there is more than one sinister rumor afloat as to why that tale when broached brings "Hush" to the lips of official Washington.

That this late attempt to bring before the American people *some* of the facts which either have been suppressed, or slighted, by the daily papers, shall not be branded as malicious or as muckraking, let the characterization of the operations of the Shipping Board, as given by Representative William R. Wood, of Indiana, during a debate in the House, be presented in the record. Mr. Wood is a Democrat, and certainly none can charge him with a desire to blacken the party upon which must rest much of the responsibility for what has taken place. Let not, however, this last sentence be misconstrued; the Shipping Board today is no better than when Democrats controlled it. Said Mr. Wood:

"Never since this government of ours began was there presented such a conglomeration of incompetency, graft, waste, and corruption as has been presented by the facts giving the history of this Shipping Board and the Emergency Fleet Corporation.

"This Shipping Board from first to last has been the victim or the agent of plunder and colossal waste from its very inception down to this hour."

Analyze that last paragraph! It has been the "victim or the agent of plunder and colossal waste," says Mr. Wood, and continues, "from its very inception down to this hour." In this indictment, one, if one accepts Mr. Wood's words, either must believe that the men who have operated, and are operating the Shipping Board, were, or are, quite simple-minded, or knowingly permitted or are permitting practices that have resulted in the dissipation of hundreds upon hundreds of millions of dollars.

Albert D. Lasker, an advertising and publicity man, and an active politician in Illinois during the last campaign, took the oath of office as chairman of the Shipping Board on June 13, 1921. In the three months between March 4 and June 13 more than thirty million dollars was lost through operations of the shipping fleet.

In so far as careful inquiry has been able to determine, the following actions bulk large in the accomplishments of Mr. Lasker and his associates since the middle of June:

1. Newspapers credit Lasker with official statement that the 285 wooden ships of the Shipping Board fleet are worthless and might well be taken out to sea and sunk. The 571 ships that originally comprised the wooden fleet cost a quarter of a billion dollars.

2. Mr. Lasker appears before a sub-committee of the House Committee on Appropriations, to explain why he needs $125,000,000 to continue the work of the Shipping Board. The demand originally was $300,000,000, scaled to $125,000,000, subsequently reduced to $100,000,000. After the hearing the committee voted $48,500,000.

3. Appointment of Elmer Schlesinger, of Chicago, a lawyer, as chief counsel of the Shipping Board.

4. Appointment by Mr. Schlesinger of the following special attorney personnel, to handle claims against the Shipping Board amounting to not more than $75,000 each.

Three at salaries of $25,000 a year each;
One at a salary of $20,000 a year;
Four at salaries of $15,000 a year each;
One at a salary of $12,000 a year;
One at a salary of $9,500 a year;
Four at salaries of $10,000 a year each;
Six at salaries of $7,500 a year each.

5. These attorneys' salaries totaled $260,000 a year, and this, it was promised, would be *less than half and probably not more than a quarter* of what would be expended for attorney hire during the year. A natural query comes to the reader: Why is the Department of Justice?

6. Announcement that although the list just given was of men retained for claims amounting to $75,000 or less, all claims amounting to more than $75,000 would be handled by special attorneys retained for the occasion, without fixed fee. There are *hundreds of claims* against the Shipping Board amounting to more than $75,000 each.

7. Retention of a general controller, *whose figures cannot be analyzed*, at $15,000 a year.

8. Retaining of a former United States Senator at $5,000 a year *to give legal advice to the board's legal adviser*, Mr. Schlesinger.

9. Appointment by Mr. Lasker of the following men:

J. B. Smull, Operating Vice President	$35,000
A. J. Frey, " " "	25,000
W. J. Love, " " "	35,000
E. P. Farley, Special Asst. Chairman	20,000

10. Appointment by Mr. Lasker of a number of other individuals at salaries of more than $5,000 each.

11. Announcement by Shipping Board that 205 wooden ships *costing from $300,000 to $800,000* each, have been *sold for $2,100 each.* These are the ships which Mr. Lasker did not aid in selling by announcing to the world that they should be taken out into the ocean and sunk as valueless.

What qualifications Mr. Lasker had for the chairmanship of the United States Shipping Board, a corporation in which four billion dollars of the people's money has been sunk, has not been adequately explained. The inspired dispatches that went out from Washington at the time of his appointment would have been amusing, if they had dealt with a figure and a situation other than that of the Shipping Board.

Mr. Lasker, it was explained, was a dynamo of business energy; he was a "go-getter"; he was one of the big business executives of the country. The fact, that in so far as any technical knowledge of the shipping business was concerned he scarcely knew the stern from the bow of a ship, was glossed over. As to the dynamo allegation, there is no question; the hearings before the Congressional Committee indicate that; as to the "go-getting" there is every reason to believe there was no exaggeration; he tried for $125,000,000. He also employed three shipping men at three times the salary they had previously received from the board.

As to his standing as one of the big business executives of the country there is a difference of opinion. He is the head of a Chicago advertising agency, and

The Ship Construction & Trading Company, of New York, in purchasing from the Shipping Board 205 wooden vessels for $2,100 each, is not engaged in its first transaction with the Government Board.

During the war, the company, of which Frank J. Fulton is president and one M. S. Orth, vice president of the Mexican Producing & Refining Company, is his chief associate, contracted to build at its yards in Stonington, Connecticut, two wooden vessels, minus the machinery, for $300,000 each.

After the United States Government had paid out for the account of the Ship Construction & Trading Company $1,333,000 it became necessary, for the Shipping Board to insure the completion of the ships, to abrogate the contract and finish the vessels by taking over the Stonington Plant.

Subsequent to this action, the Ship Construction & Trading Company, which already had received for its work on the two ships $733,000 more than the contract price, put in a claim of $1,952,230.94, which is still pending and which is in effect a demand for $619,230 of additional government funds.

Offsetting this claim, the Shipping Board now has before it official audits in which the claim is made by the government that there is in reality more than $300,000 due the Shipping Board for excess payments under the contract.

If the claim of more than $600,000 made by the construction company be allowed, that corporation will obtain the wooden fleet without the expenditure of a single dollar, and the government will owe it more than $188,000.

It is stated that the foregoing facts were all in the possession of A. D. Lasker, chairman of the Shipping Board, at the time when the deal for the wooden ships was consummated.

Mr. Lasker's position on the sale of the wooden ships is that the junking of the vessels would cost more than $2,000 each and that this justifies the sale of the boats awarded the New York company. On the other hand, shipping men of New York, who are familiar with every angle of the shipping and salvage business, declare that from each ship's deck more than $5,000 worth of material can be salvaged without injuring the boats in the slightest degree. Other items, it is asserted, would bring the junking to more than $11,000 net on each ship by sale at auction.

It is also stated on the authority of shipping men that the vessels could be disposed of in Near Eastern ports for use in Mediterranean trade at from $30,000 to $40,000 each.

that agency hastened to assure its clientele that the passing of Mr. Lasker to the Shipping Board did *not* mean that he had retired from the advertising agency. He also is part owner in the Chicago National League Ball Club.

E. J. Frey, as already mentioned, receives $25,000 a year as "operating vice president of the Shipping Board. He is one of three such officials. The other two receive $35,000 a year each, and the reason for the discrimination in salaries, as given by Mr. Lasker, is interesting. Mr. Frey was with the Shipping Board "all through the war." During part of that time he received $8,700 a year. He was being paid at $10,000 a year when he left. Before Mr. Frey came to the Shipping Board the first time, at $7,800 a year, he was vice president of a company operating two boats out of Los Angeles.

Mr. Lasker, in appearing before a committee of which Martin B. Madden, a member of Congress was chairman, explained his hiring of Mr. Frey, and of Mr. Smull, and of Mr. Love, as follows:

"One man was getting $35,000, and we paid it to him; another man was getting $25,000, and we paid that to him. The other man was making so many times more than $35,000, that he said: 'What I get is a matter of indifference, and I will take what you pay the other men. I do not want to humiliate them by taking less.' Those men were in important positions, and are important men in the shipping world."

The man who didn't want to humiliate the others was placed on the pay roll at the higher of the two figures, $35,000.

Mr. Love was with the British shipping firm of Furness, Withy & Company, as American manager, and is American-born and an American citizen. Mr. Smull is a member of the firm of Winchester & Company, a shipping brokerage firm. He is reputed to be a half owner in a firm whose profits were estimated by Mr. Smull at no less than $500,000 for a year. Both of these men had considerable power in the war days of the Shipping Board as they were members of the chartering committee of the government corporation. According to Mr. Lasker, it required 12 days to sway Mr. Smull sufficiently to bring him back into the midst of the wreckage he had left many months before. Mr. Lasker, in testifying, said that he told Mr. Smull that it would be only with him that the "American marine can be saved." During the war Mr. Smull accepted $5,000 a year for his services.

The wooden ships and the program which called for their construction form perhaps the more interesting chapter of the mercantile marine debacle which this country has gone through. There have been 571 wooden ships constructed. Prior to the sale of the 205 recorded earlier in this story, 112 were disposed of, at a tremendous loss. In accepting the first loss, a further loss resulted when the buyers defaulted in the deferred payments so obligingly arranged for them by the government. Two hundred and seventy-four of these vessels are, or, up to a short time ago, were tied up in the James River.

In Which the Mistake Is Pointed Out

AS STATED, there were 571 ships of wood built, and turned over, and accepted by the Shipping Board. *Only 90 of these had been finished the day the armistice was signed, November 11, 1918. The other 481 have been delivered since that time.*

As Mr. Madden, the Republican member of Congress from Illinois, said: "The mistake that has been made in the whole business is that *we have carried on a wonderful shipbuilding program three years after the armistice was signed.*"

And to prove that it can continue to build ships, even though today it is operating only 632 (all steel) of the 1,753 it has, and even though it is losing money at the *estimated* rate of $136,000,000 a year, the Shipping Board blithely goes on its way *turning out more ships. There are 19 more to be built,* and, we have the word of several, these 19 will complete the program. So much for that. Quite incidental to the building and finishing of these 19, the last of which will not be delivered until the spring of 1922, is the fact that at the recent hearing where Mr. Lasker testified, it was desired of the House Committee that $29,175,000 be allowed to finish up the score. This sum was allowed. No doubt these will be tied up, either at Camp Eustis, in the James River, where 315 steel ships are now huddled together, or in Jamaica Bay where three great fleets are idling, when they are turned over.

How much it will cost to maintain these 19 ships, designed for passenger service, perhaps may be gleaned by looking over the cost of maintaining the Leviathan, the giant passenger ship seized by this government when it went to war with Germany. The Leviathan is not in service but that seemingly has little to do with the cost of keeping it afloat. The Shipping Board, it is stated, sought to sell the Leviathan for $4,000,000. William Randolph Hearst, waving the American flag and shouting, "Down with England," obtained an injunction forbidding the sale. As a result, the United States Shipping Board pays $45,000 a month to maintain the Leviathan, and $17,000 a month for dockage space in New York Harbor. This boat could be towed out to Jamaica Bay, and at least the $17,000 saved.

The present cost of keeping the Leviathan is $62,000 a month. That is at the rate of $744,000 a year. Half of that, it appears, could be saved.

As far as can be determined, the proposals of the present Shipping Board to solve the question of what to do with the American mercantile marine now rusting and rotting in idleness, are of three kinds:

(a) Sell the ships. (They can't be sold as ships —only as junk).

(b) Make bare boat charters. (None will charter them that way).

(c) Give contracts, each paying half, sharing half. (So far, none has signified willingness to accept this proposition).

The foregoing naturally leads to speculation as to what has been done heretofore with the Shipping Board fleet. It should be explained that the ships have been operating under what is known as a M. O. (managing operator's) contract. A most interesting document. The managing operators sorrow in the knowledge that ere long public opinion, if not the Shipping Board, will force the abolition of the M. O. contract. Here is what it is, briefly:

The contracts provide that the government shall "expend all money to operate the ship, to keep it in repair, to pay its port charges, to pay any damages, to pay the men, and that the operating manager is to receive five per cent of the gross receipts."

More than two hundred million dollars (as nearly as can be estimated) was lost during the past year through the operation of this contract.

Nice for the Operator

THE government paid *all,* the managing operator paid *nothing,* and profit or loss, he took five per cent of all money collected for all cargoes carried in the ships allocated to him. Not bad, not bad! The board has not, up to the time this is written, abrogated any of these contracts. It hopes to, and the House Committee has Mr. Lasker's assurance to that effect! There have been four years of this kind of assurance, and several billion dollars lost by the American people.

In one of the preceding paragraphs the phrase, "as nearly as can be estimated" is used in reference to the loss sustained by the government in the operation of ships under the M. O. contract. The reason for that phrase is that Mr. Madden, the chairman of the committee that stands sponsor for the bill appropriating $48,500,000 for the continuance of the activities of the board, said in explaining to the House the position of the committee, *"No one can find from the records of the Shipping Board what the loss is or what the cost of anything is.*

Mr. Lasker is authority for the statement that of 9,000 voyages made in Shipping Board ships, *6,000 have never been audited* and the cost or revenue from those voyages is unknown. Perhaps Mr. Lasker has not had the opportunity to go back through the days of 1919, when John Barton Payne was chairman of the Shipping Board. At that time, there was a general controller (he was succeeded by Mr. Tweedale,) the man who now gets $15,000 a year) named Colonel E. H. Abadie. Colonel Abadie instituted what he termed a "voyage-account drive" while he was in office, and within a few weeks, succeeded in obtaining from the pockets of the operators to whom the ships had been allocated, more than *$130,000,000.* As an incident of this, it was found, that, contrary to the terms between the operators and the Shipping Board under which the operators were to keep separate all voyage-accounts, more than half of this sum had been permitted to remain in with private funds of the operators. The auditing of 3,480 voyage accounts brought in this sum. That was back in 1919. Since that time there has been no auditing of ship operators' accounts by the Shipping Board. What sums the operators have collected within that time, if any (and from the figures herein presented it is not unfair to presume that there are such sums), is absolutely unknown. It has been passed over as something quite negligible.

The status of the books of the Shipping Board is a matter that has puzzled Washington for some weeks. The rest of the country has heard little of it. Indeed, it has been stated, not with the authority perhaps that such a statement should bear, that the *vital* records (provided that there were records in such shape that results could be obtained by consulting them) have been stolen and destroyed. At any rate they do not appear to be available.

That things are in a pitiable mess, however, certainly may be gathered from what facts are officially available, and the reader is referred to the following statements:

> "Rep. Madden: "There was no system of accounting whatever. The urgent need seemed to be material for ship construction. Every effort was bent in that direction. (In connection with that it should not be considered harsh if one were to point out that of the 2,000 ships built for the Shipping Board, but 113 steel, four composite, and 90 wood vessels were delivered up to the date of the armistice, November 11, 1918—a total of 207—Ed.). The accounting of expenditures was a lost art. No one knew what became of anything or where it went, how it got there or how much it cost . . . . The controller of the Shipping Board stated that under the stress of war the accounting department was not able to find out where the ships went and when they came away from the place to which they went . . . . The record is replete with evidences of bad management."
>
> During the hearing:
>
> The Chairman (Mr. Madden): "Is there a balance sheet ever gotten out in the Shipping Board?"
>
> Mr. Lasker: "No; that is what we have got outside auditors for now, to try to get such a thing as a balance sheet."

And when Mr. Lasker mentions the employment of outside auditors, it brings to mind that there is an audit which has cost the United States Government (or its citizens) more than a half million. It was expected that, completed, the audit and the methods employed to obtain it would be of immense value in like operations in the future. *That audit, begun somewhere around two years ago, never has been completed.* It had to do with the books of the Bethlehem Shipbuilding Corporation, a subsidiary, if one may use that term, of the great steel corporation of which Charles M. Schwab is the controlling genius. Mr. Schwab, it will be remembered, at one time, shared the two-man control of the Shipping Board and the Emergency Fleet Corporation. At the same time, the Bethlehem Corporation was engaged in building ships for the government.

It was during the régime of Colonel Abadie as general controller of the board that the audit of the Bethlehem Corporation was begun under his direction. The work seemingly proceeded smoothly until a voucher for more than a quarter of a million dollars was investigated by the auditors. There was a notation, or a memorandum, to the effect, it was alleged, that $100,000 of the amount was to be charged to ship construction. The voucher supposedly was issued against Mr. Schwab. At any rate, the audit was stopped, and some months later, during the Walsh committee hearing, the facts as Colonel Abadie understood them, were given to the committee.

Mr. Schwab Is Exonerated

MR. SCHWAB, at his own solicitation, appeared before the committee the next morning. During his testimony, in which he repudiated the suggestion previously made that ship construction had been charged with any personal expenses, Mr. Schwab wept. The committee in its report, had this to say of the incident:

> "Your committee is of the opinion, based upon the testimony, that the charge made by Colonel Abadie in his testimony has not been proven and is not true."

What is of interest today is that the audit, after an expenditure of more than a half million dollars, never has been completed as originally planned and directed. The facts, whatever they may have been as indicated in the examination made by the outside auditors (and later by Shipping Board auditors), are so incomplete as to be entirely valueless.

Further to stress the fact that the records of the Shipping Board are in miserable form (granting that any records now exist), let the following evidence be added:

As a result of Shipping Board operations, construction, and otherwise, there are 3,500 claims against the government, amounting to $350,000,000, as "nearly as can be estimated." Again, the reader will note, there is the expression, "as nearly as can be estimated." It is an official stock phrase. There are 3,500 suits pending against the government, of which 900 are pending in state and district courts all over the United States. No preparation has been made by

(*Concluded on page 14*)

The three United States Shipping Board fleets assembled in Jamaica Bay, between Barren Island and the Rockaways

At the top is Fleet No. 3, now being built. At the right is the largest and longest of the three, which is Fleet No. 2. At the left is a front view of Fleet No. 1, lying across Ruffle Bar. These three photos show the collection of idle steel vessels in Jamaica Bay.

Where Japan Comes In

THE British treaty with Japan has proved distasteful to British colonies, especially those in or bordering on the Pacific. Japan's attempt to show her civilization to the world by following Civilization's favorite method of shaking a sword has reacted to create a suspicion against her designs. This has been exceedingly unfortunate for Japan, who has perhaps not sensed which way the world is going, and who is following in international affairs an outworn model, even as she has done in industrial affairs.

Discerning readers will have noticed that the British treaty with Japan is causing no unrest in this country, because it is known to our government that Great Britain specifically stated in the treaty that in the event of Japan and the United States becoming involved, Great Britain would consider the treaty at an end. This means neither more nor less than that Great Britain has elected to consider herself the natural ally of the United States, treaty or no treaty.

It goes without saying that in arranging for the peace of the Pacific, Japan cannot be ignored. This quite explains the reluctance of British statesmen to terminate the treaty with Japan without substituting another. The businesslike method would be for the United States, Great Britain and Japan to enter into an understanding governing all Pacific matters, the three nations guaranteeing that ocean to the uses of civilization as the former two now guarantee the freedom of the Atlantic. In no other way can there come "freedom of the seas." Such freedom must be guaranteed, and that can be done only by those nations which are most able to make good the guarantee.

Too many interests are eagerly active to stir up trouble between Japan and the United States, on grounds entirely insufficient for even a diplomatic quarrel. In the absence of facts precluding a peaceable understanding between the three nations, it should be entered into at once. Japan has shown a disposition to ask a great deal—a trait not entirely oriental—but firm determination founded on fairness will be sufficient to handle that quality. Japan has gained too high a place to jeopardize it by forfeiting the confidence of the modern world. The time is past when military force could accomplish much for her.

The Big Dirigible Disaster

IT IS desirable on many accounts that there should be the fullest inquiry into the disaster that caused the giant dirigible R-38 to burst and burn in mid-air and plunge into the Humber carrying to death two score or more of brave men. If apparently well authenticated reports now coming in are to be depended on, structural defects inherent in an obsolete model, well known to the aviation experts in both Britain and America, and set forth in reports on file in the departments, plainly account for the breaking of the airship.

There is much mystery behind the whole matter of the purchase by the United States for two million dollars of this British-built copy of a German airship. At every stage in the business, there seems to have been a display of inordinate haste. It may well be that the innocence and good faith of neither the British Government nor the American can be impugned. But that there were influences behind the governments, influences of a dark and sinister sort and undeterred by any scruples of honor or patriotism, is becoming more and more evident as the days go by.

From beginning to end, Germany's experience with dirigibles during the war was disappointing and disastrous. At first, the highest hopes were entertained that this leviathan of the air would prove the decisive factor in winning the war. The mere appearance of a Zeppelin over London, it was believed, would throw the British public into a blind panic ready to end the war at any cost. We know how mistaken this German psychology proved in its reading of the mind of the Briton; how the effect was exactly opposite of that intended, only intensifying and solidifying British determination to fight to the last man and the last shilling.

Over and over, it was shown that the Zeppelin was no match for the airplane in actual warfare. Its very bulk and unwieldiness rendered it an easy prey to the quick-darting and circling airplane. When, following their last raid on the British coast two of three Zeppelins flying homeward were brought down by a fowling-piece well aimed by a Frenchman out for a morning's pheasant shooting, the vaunting pretensions of the Zeppelin's promoters became ludicrous. As a weapon of war, the big dirigible lighter than air machine was utterly discredited and condemned by actual experience in war.

Of course, the dirigible continued to have speculative scientific interest. More than that, the successful crossing of the Atlantic with one stop by the R-34 opened up a prospect of possible utilization of the German invention in the speedy transportation of passengers and mails between the Old World and the new. True, giant airplanes have been found more practical in the services now actually in daily operation between London and Paris and Paris and Warsaw, Brussels and Belgrade, as in our own transcontinental mail air service. That fact aside, it is plain that any importance remaining to giant the dirigible is commercial rather than military—a matter of private exploitation for profit rather than of national defense.

Why, then, were we in such a big hurry to buy this two-million-dollar gas bag and to spend another two millions in erecting a hanger for it at Lakehurst? The British themselves condemned the Sunbeam motors and planned to delay work on their newer ship, the R-80, until Maybach motors could be procured. Why could not we wait also? Who was so anxious to have the deal go through that the report of the American officer, who inspected the R-38 in July, 1919, when it was building, and pronouncing its design obsolete, was ignored or suppressed?

These are questions that must be answered.

"The Sucker List"

THE discovery of wholesale confidence gangs who do business from mahogany paneled offices and who operate on the basis of "sucker lists," does not justify the too ready conclusion that there is a fool born every minute; it may rather be a damning indictment of a failure to provide the people with proper information regarding the traps that are set for them.

The gambler who goes into "blue sky" operations either on the buy or the sell side, deserves all that befalls him, if he is speculating; if he is exploiting, he deserves the severest penalty the law can inflict. But the usual victim of these fake "get rich quick" schemes is not a gambler in the ordinary sense; he or she is usually an innocent person who imagines that "business men" have discovered a magic process of getting money out of the air. And they are encouraged in their delusion by newspaper advertisements, alluring booklets carried in the mails, and other devices to allay the natural suspicions of the mind untrained in business.

We go to great trouble to educate people as to the habits of the subtle tuberculosis bacillus. We induct people into a knowledge of the processes by which pneumonia takes hold on the human organism and saps its vitality. We instruct people in the philosophy and method of "safety first." At election time the newspapers go to enormous pains to advise the people how to vote. But when it is a mere matter of a man investing his life's earnings, he is left to the mercy of anyone who can get his ear.

Common sense should function in behalf of the uninitiated, and it would function if given a chance, or even half a chance, but the periodical literature of our times has been devoted so completely to the spinning of fairy tales about quick and magical wealth, that the people have become inoculated with the wrong ideas. They are victims of an illusory atmosphere which romantic writers have thrown around quite practical things.

There is a field for the giving of "safety first" instructions to the people with regard to their financial affairs, if we are to judge by recent revelations. There are too many people who provide "easy picking" for men who should be breaking stones on the state roads.

A Tax on Bank Clearings

EVERYTHING is good until the better appears. There is something very impressive about the plan suggested by T. A. Darby, a former Florida Senator and widely known as the man who organized the Florida orange growers, for the solution of the taxation problem now vexing Congress and the country. It is a new sort of single tax he proposes and one very different from that proposed by Henry George. Mr. Darby would substitute for all other Federal taxes a tax on bank clearings.

He estimates that a tax of one per cent on the country's bank clearings would yield an annual revenue of from four to six billion dollars, an amount surely adequate for all needs of the national government, including the provision of interest and a sinking fund for the payment of the public debt. Requiring all banks to deduct this one per cent tax from the credit of every deposit and to make monthly returns to the United States Treasury, Mr. Darby's proposed amendment to the general revenue bill would so simplify collection, he says, that at least 25 per cent of the present cost would be saved.

He meets the protectionist argument for a tariff on imports, by pointing out that importers would pay the one per cent tax on the amount of the proceeds of their sales of the imported goods when they deposited the proceeds. Customs frauds, it is claimed, would be impossible under this system, and our own producers of wheat, cotton, wool, meat and fruit, as well as our manufacturers, would be given a one per cent advantage over foreign products sold in our markets.

Another advantage claimed for the Darby plan is that it would discourage speculative gambling and have a tendency to prevent international bankers from contracting our currency and credit here to supply money and credit elsewhere.

The proposition is daring and is doubtless open to criticism; but that is no reason why it should not have fair examination.

The War Trials

TRIALS of German officers charged by the Allies with responsibility for the atrocities of 1914 are proceeding with legal exactitude in German cities. Convictions have been secured and prison sentences meted out. A world that was frenzied by the brutalities of the period hardly pauses to observe the culmination of the human sense of justice, and a few lines in the newspapers serve to convey all that the trials "are worth as news."

Efforts made to shield responsible higher officers have been uniformly successful, the general plea of "military obedience to orders," or "shattered nerves," or "insanity" being sufficient to mitigate punishment. Cases apparently worthy of the death sentence have drawn 30 months' imprisonment. No doubt the pointing out of individuals as perpetrators of the staggering savagery is in itself a punishment not to be minimized. Moreover it has been exceedingly refreshing to see the readiness with which the German private soldiers were ready to stand with the Allied private soldiers as witnesses for the prosecution, thus testifying to the plain man's protest against systematic militarism with its senseless and inhuman policies for the handling of difficult war situations.

It is noteworthy that whenever a German general's "nerves gave way," he ordered more and more shootings. His aberration was always in the direction of more blood. The normal human being's nerves usually give way in the opposite direction. Hundreds of German soldiers whose nerves collapsed under the wanton murder of civilians simply refused to obey orders—they could not behold more brutality and blood—and were shot for insubordination in the face of the enemy. But the grip of the militaristic system was shown on the officers—there was no reaction toward human normality; it all went the other way.

Reform—Inside and Out

OCCASIONALLY a note of progress is heard. One of the southern states recently abolished the whipping of women in the county jails. Another southern state has abolished the ball and chain for its prisoners. In still another state's prison the rule of silence has been cancelled. With so much reform taking place within the precincts of prisons, hopeful people may be induced to look for humanizing reforms outside of prison also. Many barbarisms persist in modern life, many vestiges of the jungle law. The defects of the life "inside" are the result of too much suppression; the defects of the life "outside" are the result of too much freedom. And perhaps the latter is hardest to reform.

Mr. Ford's Page

MOST of the things which people say they see, are actually seen. There is no imagination about it. The pessimist who sees things going to pieces, is not deluded; he is correctly reporting what he actually sees. The optimist who sees things soaring up to the height of perfection is an equally good reporter—he is not fooling us or himself—he sees what he says he sees.

But the trouble is, too many people are doing all their seeing within too narrow limits, and while their reports of what they see are true, they are not comprehensive. There is nothing more likely to be misleading than a field of vision so narrow as to leave out part of the points. It is like seeing the elephant so limitedly as to report only his tail or tusks. The animal appears quite differently in a comprehensive view.

Now, all this has an important application to the state of mind in which many people find themselves today. There are perhaps more minds focused on economic problems than ever before, more people thinking, or perhaps it is more truthful to say they are wondering, about the conditions which have befallen human affairs.

It is probably true that though we are all looking and wondering, we do not see very much as yet; but it is still a mighty fact that the minds of the people are focused on their affairs. Formerly we left it all to the government or destiny; but now the governments have failed us, and destiny is not a thing to take without co-operation. And there is a million-fold more chance of seeing when we are looking than when we are not. That is the attitude of people today: they are looking, and presently they will see.

Some people see certain things going to pieces. They see correctly. Certain established customs, methods, processes, institutions, traditions we have been accustomed to lean upon, are undoubtedly going to pieces, and they are going to pieces irrecoverably too.

It is that last element—the irrecoverability—that strikes fear to many people. They thought that "normalcy" meant the recovery of the old things, the re-establishment of the old way, the restoration of the old habitual leaning-posts. Most people thought of "normalcy" in that way—as yesterday come back. But yesterday is not coming back.

The old world is dead, dead, dead. It is beyond recovery. God himself will not restore it, and Satan cannot.

That is the a b c of the new alphabet, namely, the old world is dead. Not dying, but dead. The things you see going to pieces is its funeral, its decay.

If people would only learn this a b c, it would save them from a great deal of confusion.

But the point is this: those who say that everything they see is going to pieces, are telling the truth, *because their eyes are focused on the things which belonged to the old era.* The old era is dead, and is being buried bit by bit. Every day another fragment of it falls into dust.

Now, if that is *all* that you see—and it will be all that you see if it is all that you look for—no wonder you have the feeling that *everything* is going to pieces.

But if you turn around and see what is coming swiftly up behind your back, as you gaze apprehensively into the past, you will get the other half of the field of vision: you will see the things that are to be.

Perhaps you have seen the oak take color in company with other trees in the autumn. Then came the rains, and the other trees let go their leaves; not so the oak, only a few did he let fall. Then came the winds, and the branches of the other trees were left ragged; but the oak held most of his leafage. Then came the frost, and all the trees were stripped clean and bare of leaves; but the oak leaves shriveled a bit and took on the tone of old Cordovan leather, but for the most part clung to the parent boughs. They are a cheering sight in winter, those shriveled leaves that defied the frosts of autumn; they are a cheering sight as they defy the winter's snow and blast. Then winter begins to wane, and spring is a promise in the air, and green things begin to appear, but still the oak holds tenaciously to last year's foliage. A little later and the leaves begin to fall—in spring. If you had not looked around upon the earth to see what else was transpiring there, if you did not know what compensating work was being done, you might well think that at last every leaf in the world was about to go.

But this is the fact: the leaves that stayed longest, that we had learned to associate with stability—those are the leaves that fall before the new leaves appear.

In the social order, is it not our seemingly most strongly established things that are beginning to flutter down? Are not the most solidly essential services the ones that are now most under doom? Certainly, as anyone who focuses his vision only on the passing things will tell you. It is the collapse of the most dominant methods and institutions that alarms most people. Well, it need not alarm anyone. When the leaves of the strongest tree fall, spring is here. If you will widen your field of vision you will soon see other things springing up to take the place of that which is passing.

So, you have a choice. You can sit and look at the fading out of all that made the old "normalcy" and you can wail about calamity to come; or you can stand up and watch the new era come in, looking for your place in its ranks. If you do the latter, you will see an entirely different state of facts. It will not be imagination, or mental suggestion, or this foolish mysticism of pretending things are all right whether they are or not; it will be fact—the thing is true, the new era IS here.

A business man in a small town said it all very well the other day. Said he: "I just try to accustom myself to the thought that I have waked up in a new world. I don't know just what kind of world it is going to be, but I know it is my duty to keep on the watch to find out, so that I may be ready for it. I know there is going to be a new way of salesmanship, and I am trying to find out what it is. I know I shall have to keep wider awake, and I am trying to find out on what lines. I am in a new world and I have got to learn about it all over again. The only things that have carried across from the old world into the new is Service and Honesty—but you can drop the 'Honesty' and save time, for when you say 'Service' you say it all.

That is the attitude! That man was awake to the fact that the new era is here; he wanted to be alert in all his senses when it tried to teach him something. He says he hasn't learned much yet, but he has learned the basic thing—without which he could not learn anything at all—he has learned that the world is new. If that plain fact could be dinned into people's heads and hearts, so that even without understanding it completely, it could become the time-beat of their thinking, a great deal would have been accomplished.

Certainly many things are going to pieces. They ought to! And if you look at them long enough you may get the impression that everything is going to pieces. You should turn around and look the other way, and see the New Era marching up the side of the hill. Then you will see that although the ruin of all our own stupid, inefficient, unjust and unproductive methods is unavoidable and good, the real cause of their disappearance is the New Way which is pushing them out.

While you are looking, be sure and see it all.

NOTHING is going to pieces except that which will not fit into the New Era. All our stupid, inefficient, unjust and unproductive methods are going to the junk pile, and all the finance and legislative tinkering in the world cannot prevent it. But if you are wise you will not stand looking at the junk pile grow, you will get out and see where the New Era is going to rise, and take a hand at rearing it. People who say everything is going to pieces simply because the junk pile is growing, are looking only at one corner of the field. They have limited their vision to the funeral of the Old Era. Turn around, look the other way, and you will see another procession coming on.

Top, left—Interior of St. Anne's. Marble pillars support a lofty groined ceiling elaborately carved and guilded, the nave being lighted by many stained glass windows picturing in the highest form of the art scenes in the life of St. Anne and episodes in the long history of the shrine itself. At the head of the 15-foot wide central aisle and immediately before the great central altar of Carrara marble stands the statue of St. Anne holding the infant Mary. The relic—a piece of bone from the arm of St. Anne—occupies a reliquary of gold set in the base of the statue facing the reader and is seen through the circle of plate glass which the kneeling pilgrim kisses. Top, right—The permanent reliquary in which the bone is exhibited on special occasions, now kept in the sacristy. It represents an arm with hand of solid gold in the gesture of apostolic blessing. The relic (seen through glass) occupies the relative position it had originally in St. Anne's arm. Bottom, left—Scene in Rue Commercial, the main street of the village. It will be observed that there are many hotels and that street signs are in French. Bottom, right—Exterior of the Basilica of St. Anne de Beaupre. This splendid stone edifice built at a cost of some $200,000 in 1878, on the site of the little wooden "sailors' chapel," the fame of whose healing miracles made St. Anne's famous as early as 1666.

Lourdes of America Draws Hosts of Pilgrims

By PAUL TYNER

ONE may leave that modern Babylon, New York, after late dinner in the evening and be in St. Anne de Beaupré for lunch next day. Yet it is like jumping from the very center of twentieth century materialism into the remoteness in time and space as well as in state of mind of a medieval fishing hamlet of France or Italy. Not merely is the hurly-burly of the metropolis exchanged for the stillness of a quaint old village set amid green fields on the banks of a peacefully flowing river, but one finds himself in the midst of a people speaking the French of the early seventeenth century and, to a marked degree, thinking the thoughts and living the life of a community of olden France. In an age which is commonly regarded as the very antithesis of an age of faith, this village is just now witnessing the strange spectacle of pious pilgrims from all parts of the western continent streaming in to pay their devotions at the splendid shrine of the Basilica of St. Anne de Beaupré, a shrine which in architecture and adornment rivals the richest of the Old World cathedrals.

These pilgrims come from all parts of Canada, and from all parts of the United States in even greater numbers. In the 40 years between 1879 and 1919, they totaled no less than 5,325,209, a host greater than that which made the first and second crusades. Persons suffering from all manner of diseases are they; the blind, the deaf, the halt and the lame; and all seek relief from their sufferings and infirmities by miraculous interposition.

Of course, "there are no miracles!" according to the modernist, and yet the saying that "All things are possible to him that believes" is in train to become an accepted scientific axiom capable of actual demonstration, instead of a vague aphorism having abstract rather than concrete meaning.

A fact is a fact, an eternal challenge to intelligent comprehension. "Impossible" has become an unscientific word. The healing experiences of pilgrims to the shrine of St. Anne are not to be pooh-poohed. Confirming the saying of Rouchefacould, the mediocre mind may go on condemning what it does not understand; but the progressive mind will ever seek the truth and an understanding of the truth. To be truly free we must know the truth.

Of the 271,000 pilgrims and visitors to St. Anne's last year and the 300,000 who probably will make up this summer's total, not all will go on the record of the healed. Perhaps only one in a hundred or one in a thousand will be counted among those whose petitions are granted—to the outward observation. Keeping in mind that practically all are cases given up by the physicians as hopeless from the medical standpoint, the healing of even one in a thousand means an achievement. Reasoning by analogy, the healing of one proves the existence of a healing power—a power capable of healing in *every* case, were the law of that one healing complied with fully. A law is proved quite as much by what the world calls "failures" as by what the world calls "successes." Failure to obtain the desired result in spiritual healing must be explainable in much the same way as failure in a chemical or mechanical process. Sand in the gear, a loose bolt, or a defect in ignition may make all the difference between a smooth-running and a balky motor car. A slight variation in temperature or an infinitesimal variation in the proportions may spoil a chemical combination. Under or over exposure may spoil a photographic plate.

These, of course, are not the explanations vouchsafed by the good Redemptorist fathers in charge of the church of St. Anne. Yet they were suggested to my mind by a remark made by Brother Jean-Louis, the bright, earnest and enthusiastic young juvenate who was good enough to act as my cicerone.

It was in a pause between the morning services. After inspecting the hundreds of crutches and canes ranged against the back wall and around three pillars on which they reached almost to the roof, we had advanced up the broad central aisle to where the precious "relic" was exposed to the veneration of the faithful at the foot of a statue of St. Anne carrying the infant Mary in her arms. Itself an exquisite piece of art, both in modeling and coloring, the statue occupied a niche or arch formed of myriad tiny colored electric lights. A mass of fresh roses and lilies sent up their incense from its feet. The beautifully carved golden reliquary was set in the base; an opening near the top and facing us showed plainly, through a circle of thick plate glass, a bit of bone yellowing with age and about two inches long by one inch in width—a bit of bone from the arm of the grandmother of Jesus!

The August sun was pouring through the beautiful stained glass windows. Behind the statue, in the deep recess separated by a wonderfully carved marble communion rail, rose the great altar before which swung three richly worked lamps, the central one of gold and those at either side of silver, in which burned softly the mystic lights symbolic of the life divine and eternal. The notes of a Gregorian chant sung in the confidently conquering notes of a clear baritone, and the deep murmur of the organ accompaniment seemed still to linger in the air. Scattered through the body of the church were perhaps half a hundred worshipers who had lingered after the mass for special devotions. Others were kneeling before one or the other of the "stations of the cross" in sculptured and colored high relief that adorned the walls at intervals between the tall windows. In one corner, a venerable white-haired priest was silently praying. On the other side a little group of Ursaline nuns from the neighboring convent, in their brown habits, were telling their beads in adoration before the side altar dedicated to the Virgin Mary.

Quietly, reverently and moving with evident difficulty, a young man, whose pale face showed traces of pain long and patiently endured, approached the reliquary and kneeling kissed the glass covering of the relic, having first wiped it with a fresh handkerchief. Then he bent his head for a few moments in prayer Rising, he betook himself to a neighboring pew, where he continued his devotions. He was succeeded at the foot of the shrine by a young girl seemingly suffering from some defect of vision, if not total blindness. She was led to the spot by an older woman—perhaps her mother. And so a constant stream of afflicted persons flowed to the prayer step of Champlain marble. No lines were formed, but there seemed to be some understanding by which no single devotee remained for more than a few moments before the relic, each giving way to the next who emerged from a pew close at hand in perfect quiet and perfect order. One old man —he might have been a laborer from his toil-worn frame—whose twitching head and shoulders indicated a nervous palsy, seemed particularly intense, returning

The General Grant in a park of the same name, which contains 10,000 sequoias, is the second largest tree in the world. Imagine if you can a tree so gigantic that it would reach from fence to fence if set down on a country road, and with a height about eight times the width of the road—that's the General Grant.

The Oldest Things Alive

By CARL SCHURZ LOWDEN

Courtesy of the National Park Service

Which was the greater poet, Longfellow or Whittier? Let "The Poets" in the Mariposa Grove settle this point. Longfellow, on the left, grew true to his name; he is two hundred and seventy-three feet tall, just five more than Whittier.

IN HIS day Methuselah was "some" patriarch. A hundred years was a mere bagatelle, nothing to worry about; and five hundred seemed to Methuselah little better than a good beginning. He had no intention of vacating the world too soon. He lived on and on, probably aspired to a full thousand, but attained only 969. From that day to this, however, 969 has stood as the record for human longevity.

The modern record is held by a man in Asia Minor. I cannot pronounce his name and I would not be able to spell it, anyhow. But this man is 156, and he has high hopes of reaching a hundred and three score. Compared to Methuselah, this unnamed fellow is a rank amateur in the art of living long; and Methuselah is a rank amateur when compared with the oldest living thing of today.

That proud distinction belongs to General Sherman, a big tree in California. Man cannot cope with his arboreal rivals. General Sherman is said to be 3,600 with a fine prospect of adding another thousand or two before he bows his head to the inevitable scythe of Father Time. He looks down on us humans and shakes his shaggy head as he beholds our puppet vanity; and he contemplates the disparity of his near maturity at 3,600 while our oldest has one foot in the grave at 156.

The age of 3,600 is conservative. Many authorities estimate it at 4,000. Galen Clark, the famous woodsman of the West and of California in particular, declared that General Sherman is 6,000 years old. The wood rings of a living tree cannot be counted; when the veteran of countless summers and winters tumbles to the ground, man takes a pencil, some paper and a magnifying glass, and calculates the age on the basis of one ring for each year.

"The Big Tree," John Muir thought, "does not attain anything like prime size and beauty before its fifteen-hundredth year, or under favorable circumstances, does it become old before its three-thousandth. Many, no doubt, are much older than this. On one of the giants, 35 feet 8 inches in diameter exclusive of the bark, I counted upward of 4,000 annual wood rings in which there was no trace of decay after all these centuries of mountain weather."

Robert Sterling Yard, of the National Park Service, said that of all the nights he had slept in the mountains the one he remembers best was spent in a sequoia grove of the Giant Forest. He and two companions shared a bedroom amid purple red sequoias with trunks fifteen feet in diameter and a ceiling 120 feet above, outlined by the flickering camp fire. There he obtained rest with inspiration.

"In the Giant Forest," he afterward commented, "grow a million sequoia trees, some of them tiny babies of a year, springing sharply from the warm, moist soil; some of them youngsters of a thousand years just peering over the tops of the towering sugar pines; some of them youths of two thousand years with fine rounded crowns and huge bent arms hugging their plumed togas; some of them majestic seniors, three hundred feet in height, who began life while the dramas of the Book of Exodus were still enacting."

Perhaps the General Sherman was a healthy young fellow a thousand years old when David killed Goliath with a stone from his sling. The tree probably had born seed at the time of the destruction of Sodom and Gomorrah. It may have been as old as our nation when the brothers of Joseph sold him down into Egypt.

The value of the General Sherman as a relic of bygone ages is attested by the fact that a picket fence has been built around the base and all persons have been barred from the inclosure. During the tourist season soldiers are detailed to guard him. Without this protection his twenty-inch bark overcoat, which he wears in summer and winter alike, might be stripped from him by souvenir hunters; and if he did not die from the injury itself he would certainly die from shame.

This tree, commonly called the oldest living thing, though there is in Mexico a cypress which may be older, has a height of 280 feet with a diameter of 36 ½. It would hide the front of the average house, and if felled it would almost equal the length of the hundred-yard dash. Many of its mates exceed this measure. The Mark Twain bears the proud title of the tallest tree in the world, as the tip of its topmost branch towers 331 feet above the ground.

No other sequoia has a greater diameter than the General Sherman, though the General Grant makes a close approach with 35 feet, but is shorter by a rod. The Grizzly Giant, another of these wonderful trees, is slightly more than 200 feet tall and nearly 30 in diameter. The first branch, 125 feet from the soil, is two yards through, a veritable tree itself. Eighteen horses, standing head to tail, barely circle its base; 22 persons can accomplish this if they stretch out their arms and touch the tips of their fingers together. When one has thus lined up to play drop-the-handkerchief around a "Big Tree" and chased around the 100-foot ring a couple of times, he is quite willing to concede the immensity of the arboreal chieftain.

The Grizzly Giant is hollow at the base. Perhaps the room was made by some forest fire that swept the region. Anyhow, a great party of mules, ponies and horses can easily be stabled therein at the same time. One can romantically imagine that the Indians may have used the room for their pow-wows. In days long gone some Spaniard may have cached gold and treasure there.

What secrets the old tree might tell if it could speak our language! It has a stirring life-story of fire, flood, lightning and earthquake. It has endured much. It has seen much. Every year a thousand forms of life struggle for existence in its neighborhood. Millions of seeds drop from its own cones, but few survive. Fire would devour it, but fails; yet this same agency that would destroy the big tree performs a helpful service by burning off the rank vegetation, which has kept the seeds away from the soil. So a fire both saddens and gladdens the heart of a sequoia; it shortens its life but brings new life into being.

The name of this tree is expressive, as it fits like a glove should fit a woman's hand. The Grizzly Giant has been struck by lightning dozens of times, and its top woefully shattered on each occasion. It pays a penalty for towering head-and-shoulders above its neighbors. Nothing protects it from the wind and the increased velocity that storms bring. It is battle-torn but rugged, enduring into unknown ages.

The General Sherman was thus christened by James Wolverton, the hunter and trapper who discovered it in August, 1879. He had made the celebrated march from Atlanta to the sea, and greatly admired his leader. Mrs. Lucretia P. Baker, a member of a party which camped near a big tree in the autumn of 1867, gave it the name of General Grant in appreciation of his military successes.

A pair of sequoias in the Mariposa Grove of the Yosemite National Park are picturesquely known as "The Poets," individually as Longfellow and Whittier. In the Giant Forest of the Sequoia National Park are a number of trees "old when Rome was young and bidding fair to grow broad and high for a thousand years to come." This is the home of the General Sherman, also of the Abraham Lincoln and the William McKinley, which falls short of 300 feet by a scant three yards. The General Grant is in a park of the same name; the George Washington and 10,000 sequoias keep it company.

At least four of the big trees are alive and healthy, though they have been tunneled so that automobiles and other vehicles may pass through them. Two, the Wawoma and the California, are in the Mariposa Grove; they had been so seriously burned by forest conflagrations that enlargement of the passages can scarcely be considered as an additional impairment of their vitality. Roadways also have been cut through the Dead Giant and the Pioneer of the Tuolumne and Calaveras groves, respectively.

General John Bidwell, a famous character in the American history of California, probably was the first white man to see the big trees. In 1841, while with a party of immigrants making their way to Sutter's Fort on the Sacramento River, he noticed the great sequoias and immediately appreciated their grandeur; but he was too busy dodging Indians and getting food to make a close examination of his find.

Two or three years after the party had broken through the wilderness and reached civilization, John C. Frémont, the explorer who later became a presidential candidate, stopped at the Sutter settlement. Bidwell told him of the remarkable giant trees he had seen. Frémont laughed. He had heard exaggerations, or "tall stories," before. In this way he lost a chance for the honor of giving to the world the story of the discovery.

Throughout a period of a decade and one year the world did not know that the sequoia existed. The news was not disseminated until 1852, after A. T. Dowd, a hunter, had penetrated the Calaveras Grove. Even then his friends would not believe the story he brought back to camp. They refused to accompany him to the spot, as they feared it would be a fruitless, wild goose chase. Then Dowd resorted to stratagem. They were all hunting together one day, when he brought them into the presence of the forest masterpieces; and thereafter the fame of the trees spread rapidly.

An unnamed tree in the Calaveras Grove made Big Tree history. It was 300 feet high and 30 feet through the base, and its bark overcoat had a thickness of 18 inches. Somebody conceived the idea of removing the bark and exhibiting it as a curiosity; so the tree was girdled and an immense bark ring 30 feet high and of the same diameter was taken. At the Crystal Palace Exhibition in London this oddity created a real sensation, and the big trees obtained more publicity from it than the press agent of a circus could have heaped on them.

As the girdled tree could not live, the owner decided to manufacture souvenirs from it. The method of felling it with axes seemed impossible and was not even attempted. Five men worked twenty days boring it with pump augurs. With the trunk severed it would not fall, as it rested squarely upon the stump. The men spent two days in the process of inserting wedges; but nature stole the glory of the conquest

(Concluded on page 14)

Courtesy of the National Park Service

Though now only a little more than 200 feet tall, the Grizzly Giant, on the left, probably mounted higher towards the clouds many years ago. Storms and lightning strokes have chastened it; yet it has a girth so tremendous that eighteen horses, standing head to tail, are required to encircle it. Center—Auto road in the Giant Forest of Sequoia National Park. The three big trees in the center are youths only 1,200 or 1,500 years old; they may reach 4,000 or 5,000 before some cyclonic wind downs them. Right—The General Sherman, largest tree in the world, measures 280 feet in height, thirty-six and one-half in diameter. It was a seedling 2000 years before Christ was born.

Jewish Degradation of American Baseball

Corruption Began Years Ago; Burlesque Managers in Big Leagues; Story of the "Lasker Plan" and Judge Landis' Shrewd Move

EVERY non-Jewish baseball manager in the United States lives between two fears, and they are both describable in the Biblical term "the fear of the Jews." The first fear concerns what the Jews are doing to baseball; the second fear concerns what the Jew would do to the manager if he complained about it. Hence, in spite of the fact that the rowdyism that has afflicted baseball especially in the East is all of Jewish origin—the razzing of umpires, hurling of bottles, ceaseless shouting of profane insults; in spite of the fact that the loyalty of players had to be constantly guarded because of the tendency of individual Jewish gamblers to snuggle up to individual players; in spite of the evidence that even the gate receipts have been tampered with—the managers and secretaries of baseball clubs have been obliged to keep their mouths closed. Through fear they have not dared say what they know. As one manager said, "Good God, man, they'd boycott my park if I told you!"

This in free America, and in the "cleanest game"! It is time for baseball fans to begin to look round.

Incidentally, the fans have been looking round. The fans *know*. If managers only knew how much the fans have observed, they might feel more certain of support in the event of a move toward a clean-up.

Not Really Gamblers; Not Really Sports

ALL that the Jew needs to make him eligible to baseball or any other sport on the same terms with other people, is to develop a sportsman's spirit. The Jew has crowded into all the lucrative sports, but only on the commercial side of them, seldom if ever in sympathy with the sport as a real sportsman. The Jews referred to as gamblers in these articles are not really gamblers: they take no chances; they are not sportsmen enough to gamble; they are "sure thing" men. The "Gentile boobs" who walk into their traps are the people who provide the money. Even in the field of money, the Jew is not a sport—he is a gangster, ringing a gang of his ilk around his victims with as much system as a storekeeper supplies clerks and delivery boys.

Lately the Jews have been endeavoring to prove that they are sports. Venial sport editors are sometimes induced to write certain laudatory articles along that line, and frequently the name of Benny Leonard is used—Benny Leonard, the light-weight fighter. Benny forms an instructive illustration just along this line. Benny declares that he went into the ring without a scar and that he will leave the ring without a scar. Why? Because he will let no one hit him. He will go a long way to avoid pain.

The true wrestler risks and often suffers physical pain. So does the true ring fighter. But it is a Jewish characteristic to avoid, if possible, the pain of contest, just as it is a characteristic to avoid unnecessary effort.

Look at the other light-weight champions and fighters. Kid Lavigne carries scars; his hearing is affected by the blows he took. Battling Nelson was so badly shattered by his fights that operations were necessary. Ad Wolgast, as a result of the honest straight fighting he endured, went into a sanatorium. Imagine Willie Ritchie and Freddie Welsh boasting that they never took a blow! But Benny Leonard is still unscarred. It may be boxing, but it is not fighting.

Hippodroming the Baseball Diamond

WRESTLING is so tightly controlled by Jewish managers, that a real wrestler is absolutely barred out, for fear he will be able to show that the handful of wrestlers hired by the Jewish trust are not wrestlers at all, but only impositions on the good nature of the public. In order that the statement just made may not be misunderstood, it is repeated: the wrestling game at present is like the chariot race in a circus—the performers are hired men and the race is only a sham. The Jewish controllers of wrestling will not permit a real wrestler to appear—indeed, they go to infinite pains to bar him out—because a real wrestler would immediately show up the game. Wrestling is as much a Jewish *business*, controlled in its every part, as the manufacture of clothing, and its hirelings are mostly Gentiles.

That is what baseball was coming to. The whole sport was getting down to an "exhibition game" status. The overtone of "money, money, money" grew louder and louder. The sport aspect of the game was beginning to give way to the "show" aspect. There were numerous signs that an attempt was being made to "star" certain persons, to run "headliners," and to pull off a game with a sensational ending—just like a ballet is staged, or a pageant. Thrills were being offered—not as the give and take of the game, the accident of tensest action, but as practiced acting.

That is, baseball was slowly being brought under the level of the box-office idea.

There were forces against this metamorphosis of the game. Certain men saw what was coming. There were also forces favoring the change, and wanting it to come. Curiously enough, the forces that favored turning baseball into afternoon vaudeville were Jews, and those who favored keeping the game as part of American outdoor sports were non-Jews.

There was more involved in that Chicago trial—that curious medley of Jewish defendants, witnesses, lawyers and judge—than the mere trial of baseball players accused of unlawfully taking money.

The players were the "Gentile boobs." The players were not a whit different than a candidate for the United States Senate who plays the game according to the Jewish method. Every player on trial was there because he had listened to the suggestions of a Jew. The Jews who made the suggestions were not on trial. Some of them were not even indicted. Some who were called before the grand jury were not required to testify. Others who were indicted were acquitted. The spotlight of the whole scandal was centered on the non-Jewish players who were pushed out in front to do the job and who were known to any number of Jewish witnesses as having been mixed up in whatever shady work there may have been. The "Gentile boobs" had no witnesses; the Jews had all of them.

The Corruption Began Years Before Discovery

THIS is not a whitewash for the players. They deserved all they got for mixing up with the low hangers-on; but they did not deserve it alone. Had they been half men there would have been a few Jewish gamblers cured for life of the little habit of approaching ball players with a shady proposition. The players are Jewish dupes. To be such a dupe is punishment enough.

It would be erroneous, however, to hold the opinion that corruption in baseball began with the matter which was aired in court. Reference was made at the beginning of this article to the fear which the managers feel. This fear is of long standing. The managers had observed certain manifestations of evil years before. They had heard rumors which they did not repeat to their closest friends. They had started quiet investigations the results of which they did not reveal even to their partners in the clubs. Everybody acquainted with the true situation lived in deathly fear of emitting a whisper that might give a clue to the truth. But the truth is stronger than walls and doors and steel vaults—the truth was known at every stage of the game, by somebody.

Fans may recall that several years ago one of the eastern teams began to get rid of most of its men. It was a strange proceeding and occasioned much discussion. The sport pages speculated about it and the "wise" ones doped out plausible or fantastic explanations. The true explanation has never yet been given, and it is this: the manager of that club had seen certain things in the World Series of that year which turned him cold. He knew that he saw them; morally he was convinced that something was wrong; he exhausted every available method to get at the truth, and failed; so, unable to bring the men to public punishment, he simply got rid of them one by one, and the next season he had practically "rebuilt" his team. That was not more than ten and not less than five years before the 1919 World Series which formed the basis of the Chicago scandal.

It may be stated also that this which follows is the concensus of Jewish opinion as regards baseball: "You can't kill baseball as a *business*. It will always draw a gang on an afternoon, particularly a Sunday afternoon. It can be 'pepped' up and 'jazzed' up in a way that will make it quite a show."

The Jews are probably right, that baseball cannot be killed as a business. But it can be killed as a sport. And the American baseball fans who value the game as a sport should wish its utter destruction rather than consent that it become a rendezvous for the gangs that now fill the Jew-controlled burlesque houses. Baseball as a business will become a danger in American life, a mob-center, a hang-out of the disorderly and criminal classes.

There is another peculiar Jewish story regarding baseball which has not been told and it necessarily brings in the name of Judge Landis, of Chicago, an upright man with a wise head, whom the Jews would better not try to fool.

When the story is told, however, even the Jews will agree that Judge Landis is too shrewd for them.

The Genesis of the "Austrian-Lasker" Plan

BEFORE the baseball scandal the situation was this: Ban Johnson was the head of organized baseball, through the National Commission. He had brought the sport from a minor place to its position as the national game. Ban Johnson was something of an autocrat, as all leaders must be, because as old General Booth of the Salvation Army said. "If the Children of Israel had been managed by a committee, they never could have crossed the Red Sea." Autocracy has its uses, especially in striking out new lines. Ban Johnson used his power for baseball, not for personal aggrandizement. He saw the game grow great, he wanted it kept clean. In his efforts to keep it clean, he made certain enemies. One of those enemies, the Jewish owner of a baseball club, threatened to "get Johnson." As far as the National Commission as the head of organized baseball is concerned, they did "get" him. But so far as his prestige is concerned, so far as his character and reputation are concerned, they did not "get" him.

Judge Landis was a fan. That is, he was a fan, besides being a learned and rather strict judge. Judge Landis was one of the few judges who did not quail before Chicago meat packers and Jewish bootleggers. Judge Landis always went the limit on the numerous cases of Jewish business crookedness that came before him—"blue sky" investment companies, and the like. He was at least one judge who tried Jew and Gentile alike and whose impartiality and fearless righteousness no one doubted.

The Great Idea—"Unseat Judge Landis"

JUDGE LANDIS was a rather uncomfortable man to have on the bench in Chicago.

Moreover he was a comparatively poor man. The United States pays its judges only $7,500 a year. That is less than $150 a week, comparatively little on which to live as a Federal judge must live. Yet Judge Landis lived in a modest house and within his income. And no one ever dared tamper with him. An honest judge on the bench, a frugal man outside.

And he was a fan!

Now, while Ban Johnson was doing his best for baseball, and while Judge Landis was seeing a game as often as his duties permitted, certain others were viewing the situation. One of them was Alfred S. Austrian, the Jewish lawyer referred to in the last article, attorney for several ball clubs, friend of Replogle and Lasker, attorney for Rothstein the gambler and several others. Barney Dreyfuss, the Jewish owner of the Pittsburgh Club was on the trail of Johnson, on persistent enmity. The Jewish coterie in Chicago and the Jewish influence throughout American baseball looked at Johnson and they looked at Judge Landis.

Then the great idea broke! If at one stroke they

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

could rid baseball of Johnson and rid the bench of Landis, what a good job that would be!

Both these men were dangerous to Jews—not that they intended to be, not that they were consciously so—and it would be desirable to remove both from the spheres of their activity.

Then it was that the Jew lawyer, Austrian, came forth with the "Lasker Plan," named for his Jewish friend Lasker, member of the American Jewish Committee, head of Lord & Thomas (Gentile names) and Chairman of the United States Shipping Board.

The "Lasker Plan" proposed that the National Commission with Ban Johnson be superseded by a one-man government, that one man to be selected from outside both leagues.

The proposal was not an immediate success. Even the National League was in no hurry to obey this suggestion against Johnson. Indeed, there was so much hesitancy on the part of the Nationals in which the Jewish colleagues expected to find their best support, that the trump card was played.

There Is Always a Concealed Play

WHAT was that trump card? It is said to be the secret testimony of the grand jury before which Ban Johnson was glad to appear as a witness to tell the jury everything it would need for a proper prosecution of its inquiry, and before which Alfred S. Austrian also appeared to save some of his clients from the consequences of such testimony. The report is that Austrian was able to reproduce at the National League meeting the secret testimony which Ban Johnson had given before the grand jury, and by that means swing the Nationals against Johnson and in favor of the "Lasker Plan," because in the grand jury room Johnson told the truth about certain elements in baseball, which was held to reflect on National League members. What those elements are may be gathered from a survey of the people who were interested in "getting" Johnson. Johnson is anything but anti-Semitic. He probably has never stopped to think about such a thing. He has never been known to attack Jews as Jews. But he has stood for straight baseball, and for so standing he has won the enmity of the Jews in baseball. These facts are sufficient to justify a conclusion.

So, with Johnson left to head only the American League and not both leagues, the next task was to select the new autocrat of baseball. Not a commission this time, but one man! With all his power, Johnson was never more than one of a commission; but the "Lasker Plan" disposes of such safeguards and leaves the whole authority in one man's hands. It will be interesting to see who becomes the second incumbent of that office, if indeed the "Lasker Plan" lasts long enough to warrant a second autocrat.

The Judge Was More Than a Match for Them

GENTLE reader, do you suppose for a moment that the Jews who opposed Johnson did not know who the new leader would be? Ah, well they knew! He was to be a man outside both leagues. And he was to be a man whom the Jews would just as soon have off the bench as on it. He was, indeed, none other than Judge Landis, who can be trusted to see through a trick as far as any other living man.

Of course, he would accept a $42,500 job, he who was receiving only $7,500 a year! And, of course, he would resign from the bench!—thus the coterie reasoned.

They trooped over to the court to interview the judge. They made so much commotion on their entry that the gavel was banged for order. The interview was held. Judge Landis agreed to accept. This news was widely heralded. The judge tied them down to a seven-year contract. It was assumed in all the interviews in all the newspapers that the judge would resign. It was assumed he would devote the rest of his life to baseball.

The baseball magnates signed up under the "Lasker Plan" put across by Austrian.

Judge Landis also signed.

And then he remained on the bench!

The reader no doubt remembers how quickly enthusiasm for Judge Landis died down in certain quarters. Remember too, no doubt, that *a fight was started immediately afterward in the United States Congress to force Judge Landis off the bench*—not to make him give up the dictatorship of baseball, but to make him quit the bench.

And be this said: in spite of all the collusion and conspiracy and trickery, of which Judge Landis was the unconscious object, baseball fell into the hands of a man who will be just as jealous for its good name as Ban Johnson was. The Austrian-Lasker-Dreyfuss plan has so far failed. And Judge Landis has rendered several decisions which show that on the bench or off the bench he has the same shrewd eye for the detection of a fallacy.

Judge Landis is safeguarded by a seven-year contract. He is free to be absolutely fearless and fair. What his accession means to baseball will be anxiously awaited.

Judge Landis is probably not empowered to stop the steady falling of baseball clubs into Jewish hands, and if this cannot be stopped, his position as supreme dictator becomes little better than that of a police court judge settling disputes relating to the rules and offenses against them. The peril of baseball goes deeper than that.

The Fate of Boston's Famous Club

A FEW years ago the owners of the American League entered into a gentleman's agreement not to sell their holdings at any time without first consulting all the other owners. The name of a prospective purchaser was to be submitted and considered, and the deal was to wait upon the approval of all the owners in the league.

In the face of that fact, many people wonder how Harry Frazee became owner of the Boston American club. It is very simply explained: the agreement was not observed in Boston's case, and thus another club was placed under the smothering influences of the "chosen race." The story is worth telling:

Frazee, like so many of his kind, was in the "show business," a manager of burlesque companies. Then he saw a chance in sport. In partnership with Jack Curley, another Jew, he put on the notoriously crooked fight between Jack Johnson and Jess Willard at Havana. Curley has been the principal influence in killing wrestling, by precisely the kind of Jewish policy here described.

Frazee's Part in the Cuban Fake

JACK JOHNSON, the Negro, was a fugitive from justice, yet he was champion prize fighter of the world. He was spending money like a wild sailor, and his funds were running low. He was getting into precisely the condition where Jews like to find a man, to use him. Unable to fight in the United States, but still possessing the championship, he was in need of a way out. At this time Frazee and Curley made a proposition to Johnson, said to involve the sum of $35,000, if he would "lay down" before Jess Willard. And thus Jess Willard, "probably the worst fighter that ever held a title," was made world champion. Frazee and Curley then exhibited Willard on the stage and in circuses, and drew rich dividends. The crooked fight at Havana did not involve Willard, he was too poor a fighter to need "fixing." Only Johnson had to be "fixed" not to knock Willard out, which he could easily have done. But between the time when Curley and Frazee gave Willard the title, and the time when Dempsey took it away from him, the Jewish syndicate made a very rich killing out of the gullible American public.

But Curley is not the subject here, he deserves a separate story. Frazee concerns this article because he became owner of the Boston baseball team. He bought a new show—the Boston club, in the best baseball city of the American League. John J. Lannin, former owner, was a real baseball man, so much so indeed that the excitement of the games told on his health and it became necessary for him to relieve himself of the strain. Frazee was waiting to cut in, and whether Lannin feared that the proposal of Frazee's name to the American League would result in disapproval, or whether Frazee himself, knowing it, contrived to make it worth while that the agreement between the American League owners should be ignored, remains an open question.

Bringing Burlesque Into Baseball

HOWEVER that may be, the American League woke up one morning to find the little burlesque manager and promoter of a crooked prize fight in their midst. It was a sad shock to the dignity of "the cleanest sport."

What could they do about it? Nothing. Frazee had bought and paid for what he held.

Baseball was about as much of a sport to Frazee as selling tickets to a merry-go-round would be. He wanted to put his team across as if they were May Watson's girly girly burlesquers. Baseball was to be "promoted" as Jewish managers promote Coney Island.

The American League owners rebelled, but let them rebel! What could they do about it?

Frazee began his neat inside work almost immediately. Ban Johnson was unalterably opposed to the Frazee idea of sport, and Frazee set out to "get" Johnson. A split occurred in the American League, with Frazee, Til Huston and Jake Ruppert of the New York Club, and Charles A. Comiskey and Grabiner, of the Chicago Club, on one side against Johnson, and the other American owners comprising the other party supporting Johnson.

Frazee got money out of Chicago—the home of Lasker, Austrian, Replogle and Grabiner—to put through his Boston deal. A bank loaned him a quarter of a million dollars—one of Frazee's friends was a director of the bank. Frazee's friend died and Frazee had difficulty with the bank about re-making the notes. He finally was enabled to pay $125,000. Frazee secured this money from the New York American Club by selling "Babe" Ruth. Thus the New York and the Boston clubs have become financially interwoven. Boston is referred to as "New York's farm" in baseball circles.

In the meantime, the fans of Boston feel toward Frazee as the fans of Chicago feel toward Grabiner. The "class" of Boston no longer flows through the gates. The attendance at Boston park is smaller than at any other time in the last 15 years.

Now, it is unlikely that Judge Landis could tackle that question. Has he power, or lacking power, has he daring enough to assume power to drive the peril away from the ownership and fringes of baseball? It is probably not his field, but it pertains to the future character of baseball.

The Chicago Tribune Pioneers the Passing

THE Chicago American League Club is the most recent to attract the desire of Jewish capital. The Ascher brothers of that city have offered $1,500,000 for the club franchise. The Ascher brothers comprise a Jewish family, Max, Nathan and Harry, who conduct a string of motion picture theaters in Chicago. They have erected their own theatrical circuit. Like Frazee, they wish to add baseball to their string of "show businesses," and are willing to pay the price. At the time of this writing, their offer has not been turned down.

But a significant development—and in Chicago also—is the announcement made by the Chicago *Tribune* that it will curtail the space heretofore devoted to baseball on its sport pages. This, more than anything which has occurred, indicates the new scrutiny with which the game is being viewed. For a long time many observers have wondered where the "sport" was found in sitting on a bleacher watching a few men earn their salaries. Hours thus spent in a ball park "do not take anything off the waistline of the spectators nor add anything to chest measurement," says the *Tribune*; "the majority of spectators get only eye and mouth exercise." "Journalism has overfed it with space," the *Tribune* rightly says, referring to professional baseball. In ruining baseball and securing control, the Jews may be just in time to take a loss. Better no baseball than every park an afternoon midway filled with the alien and Red elements of the country.

The Nation-Wide Poison of Baseball Gambling

THERE is, however, a baseball duty devolving upon the police of every city, and that is the abolition of the Jew-controlled baseball pool. Gambling has grown up around the "cleanest game" to the extent of $20,000,000 a year. It flourishes in 150 cities in the country, and in many small towns. The "boobs," of course, are mostly non-Jews, the owners and profit-takers are Jews. It is as much a part of the national network of the Jewish gambling fraternity as are booze-running and horse-racing. The baseball pool runs more openly than the "books" because the very name "baseball" has seemed to give it the protection of "the cleanest sport." However, it has turned cigar-stores, barber shops, pool rooms, near-beer saloons, and newspaper stands into agencies for the national and international Jewish gambling forces. The bettor is entirely at the mercy of the managers of these pools.

These dishonest money-collecting devices are in violation of the law everywhere. The police could put them out of business easily if they should decide to give their attention to it. And thereby they would be taking the hands of a most undesirable alien class out of the pockets of the American people.

If baseball is to be saved, and there are those who seriously doubt it ever can be restored, the remedy is plain. The disease is caused by the Jewish characteristic which spoils everything by ruthless commercial exploitation. The disease may be too far gone for any cure. There are those who, like the Chicago *Tribune*, deny that professional baseball ever was a sport, and who are glad that Jewish exploiters, like scavengers, have come along to reduce it to garbage. But there is no doubt anywhere, among either friends or critics of baseball, that the root cause of the present condition is due to Jewish influence.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents for each volume.

Lourdes of America Draws Hosts of Pilgrims

Concluded from page 10

to the shrine several times in his eagerness to grasp any unoccupied moment.

Good Brother Jean-Louis must have noted my watching of this scene and caught something of my thought. "Yes," he said softly, "that bone of Saint Anne has a marvelous power. Thousands who have come here crippled or suffering from diseases regarded by the doctors as incurable have gone away whole, gratefully praising God and *la bonne Sainte Anne.*" He spoke with genuine fervor, his face flushed, his eyes bright and something of the ecstacy of a young saint in his voice. Then catching a questioning look in my eyes, he seemed to recover something of the calm precision of the reasoning student. He corrected himself quickly. "I don't mean that they are cured by the Saint's bone," he added; "they were cured by their faith in God's goodness; faith in the power of the intercession of the great, pure and holy soul privileged in the Divine Providence to become the mother of the immaculately conceived Mother of Christ. Without faith it would not have been possible; all things are possible to them who believe."

We passed on into the smaller chapel which occupies the sacristy at the back of the church and which is a veritable museum of interesting objects connected with the 200-year history of St. Anne's. In one large glass case, I was shown great heaps of jewelry, gold watches, bracelets, rings, necklaces. In the same case, a little to one side, stood out a magnificent crown and beside it a chalice, both of elaborately worked solid gold set with gems. These offerings are not sold, but are periodically melted down and made over into the sacred vessels and ornaments consecrated especially to the veneration of St. Anne. The chalice is valued by experts at $8,000. It is enriched with no less than 323 precious stones.

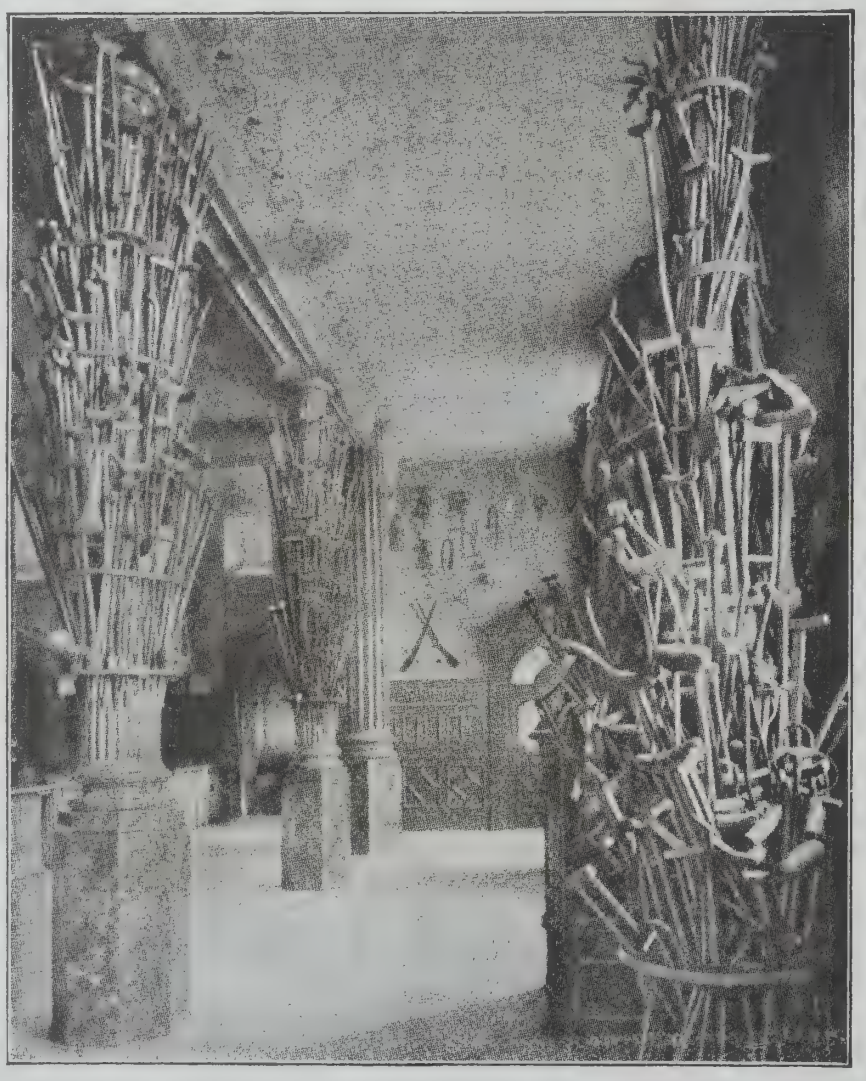
Among interesting historical souvenirs in this chapel is a solid silver altar crucifix given by the illustrious Pierre Lemoyne d'Iberville, the conqueror of Hudson Bay in 1697 and the discoverer of the mouth of the Mississippi in 1699, founder and first governor of Louisiana, the territory out of which the states of Alabama, Mississippi, Louisiana, Arkansas, Missouri, Iowa, Minnesota, Kansas, Nebraska, North and South Dakota, Montana, Idaho, Oregon, Washington, Oklahoma and the eastern half of Colorado, were carved after our purchase of the province from France during the administration of Jefferson. There also is a silk mass vestment richly embroidered in gold and silver, the gift of Anne of Austria in 1666 and made by her own hands. Visitors to Paris churches will remember the story of how Queen Anne, after 20 years of marriage, had despaired of presenting to her husband, Louis XIII, an heir to the French throne. "Fully confident in the intercession of her patron saint in this extremity," runs the veracious chronicles of the time, "she ordered prayers and masses to be said daily in every church in the French dominions for that intention. Her wish was granted by the birth of the prince who later became Louis XIV, "the Grand Monarch," who to this day stands out in French history hardly second to Jeanne d'Arc as the national hero. For him the French province of Louisiana was named. In thanksgiving, the queen ordered some offering to be placed in every church in the kingdom dedicated to St. Anne.

Then there is a gilded wooden statue of St. Anne dating from 1662, and which for 200 years adorned the front of the old church. Of a collection box used for the first time during the dedication of the second church on July 29, 1663, we are told that it was returned with 12.65 francs ($2.53), considered a good collection at that time as wages were only one franc a day. It is recorded as a remarkable event that when the viceroy, the Marquis de Tracy, and his staff made their pilgrimage a few years later, the sexton, Michel Bouchard, actually saw 70 francs ($16) dropped into this box, one silver franc after the other! But then a franc went much further in those days than it does today.

Of a later date are curious reminders of the visits of living personages, such as the chiseled and embossed silver portrait presented on the occasion of his pilgrimage to St. Anne de Beaupré in October, 1890, by the Comte de Paris, who is regarded by thousands of Catholics as the legitimate king of France.

Near this reminder of the French claimant, oddly enough, one comes upon the red onyx pen used first by King George V, of England, when, as Prince of Wales, he visited the shrine in June, 1908, and again as lately as August 23, 1919, by his son, the present Prince of Wales, in signing St. Anne's Visitors' Record.

A very curious souvenir is the seal of General Santa Anna, president of Mexico in 1832 and through the historic days of our war with that republic. This seal is made of solid gold in the form of an eagle with outspread wings standing on a rock of lapis-lazuli, engraved with the seal and holding between his wings a sphere, likewise of lapis-lazuli, the eagle's eyes being formed by two rubies, seemingly directed to the word *Mejico* inlaid on the sphere in gold letters. The seal proper bears the initials of the president, wreathed with the Mexican national insignia.



Among a number of paintings on the walls of the sacristy and adjoining passages, I single out for mention one which seemed to me especially to accord with the "miraculous" atmosphere all about. This is a large painting from the brush of Lebrun representing in the center St. Anne teaching her daughter, Mary, and on either side below them two figures in the garb of pilgrims at prayer. The picture is a votive offering made by the Marquis de Tracy, viceroy of New France in 1666, and the pilgrims in the picture are the Marquis and his Marquise. It is related that during a fierce storm at sea, the pious viceroy made a vow to St. Anne that he would make her a generous offering if she would save his life. He fulfilled his promise by presenting to St. Anne's church here this masterpiece of one of France's greatest artists.

The painting of a sailing ship of war of the early eighteenth century fashion, like that given by the Marquis de Tracy, is a reminder that St. Anne has been regarded for centuries as the patroness of sailors and of those who travel by sea. It represents the man-o'-war "King's Hero," and was presented by the crew of that vessel in thanksgiving for St. Anne's protection, when in 1711, they were cast up on the shore in the neighborhood, following a furious storm in which 84 ships of the British line sailing up the St. Lawrence under command of Admiral Walker were dashed on the rocks near Egg Island beach and destroyed, a calamity which caused the British to abandon their first invasion of New France.

"If sailors and passengers on ocean ships today prayed more to St. Anne, we would not have so many shipwrecks as we are having in these irreligious days," said my cicerone.

According to accepted tradition, the first church of St. Anne was built on this coast by a few Bréton mariners who, believing themselves in danger of perishing by shipwreck, vowed that they would erect a chapel to the patroness of their own loved Brittany on whatever spot they might be able to land.

As far back as 1662, marvelous cures were reported as being obtained at this chapel through the intercession of St. Anne. In 1665, the venerable Mary of the Incarnation, foundress of the Ursulines of Quebec, wrote: "There the paralytic are made to walk; the blind receive their sight; and the sick, whatever their ailments may be, regain their health."

Reminders of many miracles of healing. Hundreds of crutches, canes and surgical appliances are stacked around the four pillars near the entrance and hang against the walls. The crossed rifles are the pious offering of a smuggler saved from shipwreck and testify fulfillment of his vow to St. Anne to abandon his trade.

In response to a question as to the crutches, canes and steel leg-supporters and back-braces I noticed within railings around three sides of the reliquary itself, Brother Jean-Louis told me these were left by persons who had been healed within the past week. Each article was ticketed with the name and address of the healed one, his ailment and date of healing. Not all who are healed leave such visible reminders, he added. For instance, on the very feast of St. Anne this year (July 26) a prominent and wealthy New York woman had been healed of cancer, he said. At the end of six months, her physician would be asked to sign a certificate as to the genuineness and lasting nature of the cure for the church archives.

I was not fortunate enough to witness a miracle personally; but various pilgrims I talked with told me that they had been encouraged to come to the shrine, in some cases from a long distance, by the cure in former years of friends and relatives and declared that they had already experienced remarkable benefit physically, as well as spiritually, and were confident of final healing.

Joaquin Miller, the "Poet of the Sierras," has left on record interesting impressions and observations of his visit. He says:

> "For my part, I have not seen the blind recover their sight, but an English lady of great distinction, Mrs. G. P., related to me the details of the cure of a little girl ten years old, who had been blind from her birth. I never that I know is that it is true . . . . That same day, I remarked in the church a poor old man all crippled and so weak that he could not even use crutches. They helped him to drag himself as far as the statue. He sank down at its feet. As I had not come to pray but to see, I attentively fixed my eyes on that man. Nor could I easily remove them from those features in which feeling and life seemed extinct, and so deadly pale. Yet the sufferer raised his head and his lips moved. I will say no more, lest I profane the subject. Let me merely add that I saw the old man restored to health, if not to youth. He arose, and I followed him as far as the door. There he took his traveling bag and his stick and began to walk with a vigorous step. I followed him for a while. No doubt could remain: he was cured."

Not only in the Basilica itself, but also in the surroundings, everything in the arrangement and environment is well calculated to foster faith. The church yard surrounding the Basilica is a prettily laid out garden with statues and grottoes set in the shrubbery and flower beds, and in one corner is a "holy well" whose waters are said to have miraculous healing powers. Eastward of the church rises a large three-story building, the monastery of the Redemptorist Fathers, 40 of whom are engaged in looking after the work of the shrine. Here also is maintained a training school for novitiates in the order. Along the slope of the terraced hillside, stand out at intervals striking groups in bronze life-size figures portraying the stages in the passion of Christ and forming the stations of the "Way of the Cross." On one of the lower terraces, rises the edifice known as the "Scala Santa," or Holy Stairway. Here pilgrims ascend a broad flight of steps to say a short prescribed prayer. On the upper floor is a chapel with an altar. A balcony leading from this chapel affords a fine view across the broad St. Lawrence and over the surrounding countryside.

This stairway represents the 28 marble steps of the Praetorium which Jesus ascended to appear before Pilate. The original stairway, trodden by the Saviour and stained with his blood, is said to be still in existence, and to consist of a flight of 28 marble steps brought from Jerusalem to Rome about the year A. D. 35, under direction of St. Helena, mother of the Emperor Constantine. In the Eternal City they are housed in a magnificent temple where they are a constant object of the veneration of the faithful, being now "worn down by the kisses of pious worshipers whose tears of repentance and love flow continually," to quote the phrasing of the good Redemptorist Father who is the author of the official guide prepared under ecclesiastical authority for the use of pilgrims to St. Anne de Beaupré.

To those not in sympathy with the cult of this saint, there may be something repellant in the promiscuous kissing of the glass lens covering the relic, in the awkward climbing of stairs on the knees, and in the commercial suggestion of numerous boxes for offerings, and the stalls for the sale of books, photographs, gold and silver medals and crucifixes, the "Oil of St. Anne" and similar articles. But I must say that the evidently sincere and whole-hearted devotion of the worshipers reduces such impressions to minor importance.

Along with the first and deep impression of admiration for the striking demonstration of faith which these pilgrimages present, there is an inevitable sense of pathos in the reflection that while many are healed very many more experience sharp and bitter disappointment. The church itself recognizes that certain preliminary conditions of heart and mind are indispensable to any experiencing of the efficacy of the religious exercises connected with the pilgrimage and the veneration of the relic. Why could not intending pilgrims receive beforehand in their own home churches, the training necessary in most cases to induce those proper states of mind?

I do not overlook in making this suggestion, the outstanding fact that, whether healed of physical infirmity or not, practically every pilgrim who faithfully follows the directions given to him, is sure to reap decided spiritual advantages from his experience. This, after all, is perhaps more important than physical healing.

Helping the Other Fellow to Find a Job

Unique Organization Sends Men Out in Pairs to Boost One Another When Applying for Places, and the Plan Works

By DR. DU BOIS H. LOUX

Founder of the Two and Two Club of President Grant's Church

"I CAN'T get a job. I've been trying for weeks and weeks. I'm in need of a nerve-up. It's perhaps my last chance with myself. I'm a graduate of a western university. I'm a draughtsman, and am two years out of college. There is nothing to be had in my line. I go out looking for a chance, and after two or three failures in a morning's calls I'm bowled over. I'm no good for the rest of the day, but sit around feeling the hell of it. This is General Grant's church—I thought it was a good place to come for my last fight."

Your attention is called to the last sentence but one: "I'm no good for the rest of the day, but sit around feeling the hell of it."

The kernel of the Two and Two Club is in that sentence.

It took days for the idea to drift through the half-contempt that was raised by this pampered young fellow's confession. Off the shot, I could not help contrasting him with Horace Greeley, when he recurred once and again to his editorship of a well-known university paper. No doubt he had traveled over some of the very same streets that Greeley had tramped years before with his belongings strung over his shoulder. But Greeley had made at least an eight-hour day of downright seeking for a job, and the third day got his reward. The university graduate, on the contrary, as per his confession, hadn't one-sixteenth of the necessary sand to put in one honest day's work in quest of a job. In eight hours it is possible to brighten the doors of 50 places where jobs may chance to be waiting the right man.

The college man merely dipped daintily into a shop or two, and then, while his money lasted, dropped into a movie. There he caught his melodrama. A grown man going to a picture show during business hours is contemptible. Between the man who will consent to travel the streets with his head sticking out from two advertising boards that slant to his feet, one at the front and one at the back, and the man who will advertise his second-rate soul at a motion picture house while the busy hours are flying, give me the man who is sandwiched between the advertising boards.

He was a little man in size and soul who sat before me and wound up with the words, "This is General Grant's church—I thought it was a good place to come for my last fight."

I leave him for a moment to relate what President Grant's church was aiming to do for men.

It was in February, 1911, that Dr. John Wesley Hill, the pastor of the Metropolitan Temple, New York City, invited me to speak to his people at the Metropolitan Temple, Seventh avenue at 14th street. President Grant made this his place of worship when he was in the metropolis, and he was buried from it. It has a plain exterior, but a very beautiful interior. It boasts its "President Grant's pew." The Metropolitan Temple is a Methodist church. The city has grown uptown away from it. It is now in a business district. The idealists of Greenwich Village come to it, as do busy people, and young people from the boarding houses.

Dr. Hill leaned over to me from his chair on the pulpit platform as I took my seat at his side after my address. "Loux," he said, "you must come in with me as associate pastor of this church to build that gospel into this community." I shook my head, "You are a Methodist, I am a Presbyterian; it would arouse opposition." But he persisted. I finally named the condition on which I would accept. We must raise a fund together in the city for an industrial department in the church, and I must be no more burden to the church than he was. He was serving the church without salary.

Dr. Hill was soon appointed by President Taft as a special envoy to the Orient. He left me in complete charge with the splendid church committee to back me, and with high hopes for the industrial work which we had begun. His resignation from the pastorate on his return to America somewhat interrupted and transferred the seat of the industrial work to another church.

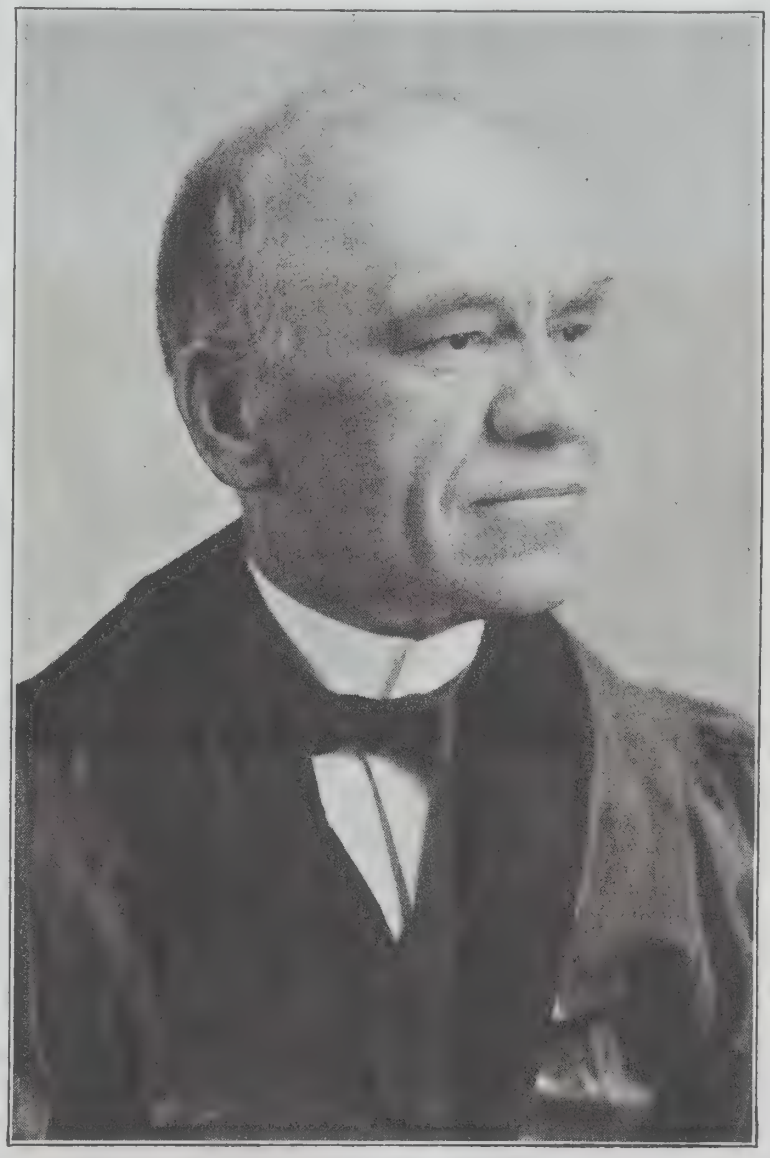
But to get back to the story of the college man. The two-and-two idea hadn't entered my head at the time. I looked him over and told him to put in a full day for once for himself, and tell me the result.

He got out of this with a poser. "The place where I worked as a draughtsman for two years has gone out of business. I haven't a city reference. The doors of New York are shut against the man who does not carry a reference from a going concern."

I took his statement with a grain of salt. It was not strictly true. Bang up young fellows will strike New York without money and will find a place in a laundry or a restaurant without bothering anybody about their experiences.

"Just help me, and let me prove that I can work."

I kept him around several days, and then took him over to a Fifth Avenue concern where they gave him a job at $12 a week. He went up the line in promotion, but *no job for any other unemployed fellow ever came to us at his hand.*



It was this last circumstance that finally rounded out the idea of the two-and-two plan.

Why not harness men together, so that they would react on each other to spur them on to do an honest day's work for a job?

But then, the thought interposed, it is quite true that New York demands men whom somebody will personally recommend.

Grant that this is true: why not have the men go out two and two to talk, not for themselves, but for a hearing for the other fellows, understanding that the other fellows were out talking for a hearing for them?

"Why, I could talk my head off for a bunch of fellows like that!" I found myself saying to myself, in face of the chagrin of having walked about for the young draughtsman with no charge to him, and *with no help from him for the other fellow.*

DR. DU BOIS H. LOUX,

Who directed the Two and Two Club described in THE DEARBORN INDEPENDENT of August 20—a miracle club that accomplished wonders by a simple method.

"Let's not make a saintly thing out of this two-and-two idea. It had no angelic origin. It was born out of resentment to ingratitude. I found myself boiling over every time I thought of this man. You know the thought, "He put one over on me, and on the rest of the fellows."

"We are going to have worth-while teamwork, and no bunch of stars satisfied to kick in just a game with no thought of a WIN!" That was the genesis of the two-and-two germ. It was the bite of the "bug" to win. "You can't do anything for me, but if I play for you, you must play for the other fellows, and they will play for you." That was the two-and-two thump. It was a stand-up-knock-down propulsion.

The girls were kept apart from the canvassing idea. I do not believe young women should be put under the necessity of tramping about, either singly or dually, for the chance to be gainfully employed. At the church the men met for our daily efficiency talk and planning apart from the women. The women had a different entrance and egress. They were in charge of a matron, and when their case came to me, it was settled on its merits, without any thought of subjecting a woman to do calling for her position. Young women must be seen before they are engaged, of course, but they always are in high hopes of the place.

I say *high hopes*, meaning precisely that. When a girl goes out to work, we should provide an atmosphere of exalted emotion for her. The atmosphere, be it equally urged, should be big enough and lasting to invest her life during the entire period of her gainful employment days.

Having settled this affirmatively among ourselves, let us see what the men did for those who were not asked to go out to do similar work for them.

I have a case in mind.

It was a young woman who had nothing at all "exalted," you will agree, for an investing atmosphere of good cheer. She was working in New York City for the magnificent sum of $6 a week. She was clothing herself and boarding herself on this sum. She was a stenographer. Stenographers require presentable apparel. Some young women informed me that they got along by living on two meals a day, their parents sending them clothes to make over, or the money for the materials. This girl had no parents living. She was a young English woman. Her father had been a railroad contractor in South Africa. She had been educated in a Catholic convent, though she was an Episcopalian, the convent being the best educational place for young women in that part of Africa where her father was working. Her education included four languages. Now she was in America, at 24, living in New York as a stenographer for the princely sum of $6 a week, an orphan.

She came into the parish house office one morning before 9 o'clock, and told her story. That she was a beautiful and refined young woman with that charm of simple dignity that is never more winsome than in young women who must spend their days in business offices, is beside the question.

"Do you mean to say that you are clothing yourself and finding room and board for that sum of money in New York City?" I cried.

She said something to the effect that she had not been here long, and that it was her faith that she would not have to continue forever on such terms of living.

"Come back in the morning," I said.

We had a boys' department in our work that worked in behalf of all boys without respect to age, creed, or color, who would take a pledge not to smoke cigarets. There was a sign outside on the bulletin board of the church stating the facts about the boys' work.

Some time before the visit of the young woman mentioned, a Yale student looked in on me to commend the stand about boys and cigarets. He caught the swing of what we were doing, and volunteered to spend the summer with us without charge, building up a boys' club, and finding them places. It was Carl Hamilton, associate editor of a Yale publication, last class but one, I believe, before the World War.

The war took him out of my knowledge. He was an industrious fellow, and not ashamed to say that he made a good income maintaining a clothes pressing service for his college mates in New Haven. Hamilton took to the idea of making calls for the men and boys as a matter of social efficiency.

He was the Chesterfield of the two-and-two idea.

I don't know that it got any more jobs for the fellows, but one of Hamilton's first ideas was that we could afford more pressed-up clothes.

In general, it is true that in New York next to London and Paris, "the apparel oft proclaims the man." Our unemployed hosts came around as the rule in very presentable clothes.

It was to Hamilton I told the story of the visit of the young English woman who was working for $6 a week. He caught the idea of her being "well dressed."

"I think something can be done for her," he said.

Now, if you are expecting a romance, I am sorry to disappoint you. I think Hamilton met the young woman but twice. But I will record that her apparel proclaimed the woman to him. He was distinctly pleased that so much could be done with so little.

"I tell you what," he said, naming the cashier of a leading bank in the city, "the son of a cashier of that bank is a college mate of mine. They've a lovely home, and have had me there a number of times. I'm going down to the bank to see them."

"Why, they told me down there," he began, when he returned, "that they had been advertising for two weeks for a young woman capable of taking foreign correspondence in three languages, and hadn't found the girl they wanted. They told me to bring our lady down and they would give her an interview.

The young woman got the place. It meant a jump from $300 a year to $1,800.

The great Muscle Shoals nitrate plants erected by the United States Government

Dawn of a New Industrial and in the Great Muscle Shoals

SOMEONE has stepped on the accelerator of the world during these last few years.

Who it was, history will decide. But historians, viewing the advance of civilization through the ages, and considering the vast changes within the last half century, will find it difficult to disassociate the name of Muscle Shoals from two of the mightiest impulses which have stirred the thought of the world.

Centuries were required to bring the world from barbarism to the day when calm thought declared that war is wrong.

Centuries were required to fulfill measurably the human impulse for political freedom.

Centuries, too, were necessary to realize the present-day industrial progress.

But it was only a few brief years ago that the awakened ambition of man, combined with the awakening needs and desires of his fellows, brought the flood of inventions which has so changed the daily life of the world.

Less than a quarter of a century ago some one expressed concretely the idea of conserving the country's natural resources. There had been haphazard efforts, some successful and some failures, to utilize the great water power of the nation. A few astute corporations had profited immensely. There had been little development in water power, however.

But with the expression of the idea of conservation, the country awakened. Where there was one dam before, there are ten now. Water power which for ages had pounded its energy against the rocks in river beds became a thing of value. Sentimentalists learned that it was possible to utilize practically the great power in the swift streams of the land, and do so without committing a sacrilege against Nature.

Much of Niagara Falls' mighty power has been harnessed, and put to work in supplying the necessaries of life for human beings. And the enslavement of this great wonder of the natural world has been accomplished without destruction of its colossal beauty.

And now comes Muscle Shoals.

Some will say that the name must inevitably be connected with the development of water power. For the Tennessee River, which the country decided to dam at Muscle Shoals, has a potential power, second only to Niagara. But water power, in the language of the street, is "old stuff" now. The world understands its necessity, but refuses to be thrilled.

There are, however, two things in connection with Muscle Shoals which derive their impulse from its opportunity.

One is the revivified idea of an industrially awakened South, an idea big enough to comprehend within its scope the thought of vast benefit to the nation and to the world.

The other is the infinitely greater conception of the conservation and renewal of the agricultural resources of the country. The country's awakening to this necessity has been slow indeed. For a half century there have been more or less confident predictions that the South would awaken to its industrial possibilities and take advantage of them for the mutual advantage of itself and the North. But except for a few agricultural college professors, and a few clerks in the United States Department of Agriculture sending out its pamphlets, there has been almost no attention given to the fact that the agricultural resources of the nation are being exhausted by reckless waste of products, by lack of care of the land, and by governmental failure to provide the farmer with his needs.

Muscle Shoals, where the United States has built two great nitrate plants, and has begun a great dam, affords ground for the belief that the South and the nation are on the threshold of a New Era.

The dam, when completed, will give the South the long sought opportunity to manufacture its own products near home, to save vastly in freight carriage charges, and to offer more cheaply to its own and the country's citizens, its manufactured products. The nitrate plants, built to manufacture war material in protection of the nation, may afford a greater national protection in making possible intensive production from the soil.

The condition which makes the industrial development of the South necessary is older than the nation itself, and grows out of the natural wealth of the section. It was the agricultural poverty of New England which first turned the attention of the down-east Yankee to manufacture and caused him to utilize the water power of his rocky homeland. Southerners, rich in agricultural resources, were less ready. In the early days of the country, their abundant agricultural resources were satisfying. They were quite willing to permit the New Englanders to share in their wealth, and without objection, but rather with encouragement, they saw the down-easters monopolize the manufacturing industry. Recent developments, however, have focused their attention on the imperative need of bringing the factory close to the raw product.

The railroad debacle in recent years, together with the rapidly mounting freight rates, has made the question of carriage foremost in the minds not only of southern economists, but also of the serious thinkers of the nation.

The vast national waste embodied in the transportation of raw products hundreds of miles to the factory for manufacture and then back again to the consumer is beginning to engage careful consideration. This means a double haulage for the great volume of goods, and a consequent unnecessary waste of labor and increase of cost to the consumer.

Viewed roughly, one-half of the population of the United States lives west of the center of the cotton belt. In 1920 the production of cotton for the country was in the neighborhood of 12,000,000 bales. One-half of this amount is annually required for domestic consumption.

Three million bales, then, are consumed east of the center of the cotton belt, and three million west of that point.

For the first three million bales, the transportation East for manufacture and back to the consuming point can be viewed only as 100 per cent waste. For the remaining three million bales, the waste is relatively smaller. But for a bale of cotton, shipped from Sheffield, Alabama, to Fall River, Massachusetts, and there manufactured into cloth and returned to New York City, the short hauls beyond New York City impress the average observer as waste, provided, of course, that manufacture of the original bale in the neighborhood of its production, is feasible at a reasonable cost.

In some measure, of course, the percentage estimates of the amount of waste are inaccurate. Some railroad statisticians, too, will argue learnedly that the waste of double transportation is no greater than the waste of empty cars from one-way carriage.

Common sense, however, convinces the average observer that in the aggregate the present manufacturing concentration imposes a burden on the carriers which in boom times is too great for them to handle.

The southerner, awakening to his industrial possibilities, is inevitably impressed with the manifold prospects which the utilization of his manufacturing opportunities affords. It means cheaper production of the finished material. To the consumer it means the saving by the elimination of the freight margin. It has been the law of business always, but never better exemplified than in these last few perilous months, that the cutting of production costs and consequent selling prices stimulates buying, and thus aids consumer and producer alike.

In a word, then, the southerner sees that his manufacture of his own raw products will make money for him, will save money for his customer, and even more important than these, will reduce the vast waste in the usage of the nation's common carriers to which a generation of growing expansion and reckless spending has habituated the country.

It means in effect that the northern and southern sections of our common country will be united in commercial bonds stronger than have ever existed before. Both North and South will feel the impulse of new business, and will become more than ever before reciprocal beneficiaries, both together forming the strongest economic combination that any single nation can present.

Muscle Shoals is a name which is becoming synonymous with this new consciousness of possibilities.

With a potential water power of 600,000 horse power, with its location in the very heart of the South's

Nitrates Will Conserve the Farms of America

Agriculture is crying for fertilizer. Nitrates will supply this need, and two great plants for the manufacture of nitrate were part of the Muscle Shoals development.

One plant was completed by the government to produce nitrates for explosives in war time. The plant has been idle since the armistice.

An industrially awakened South wants the completed plant placed in operation and wants the other plant finished, along with the completion of the water power development, so that nitrates can be distributed to the farmers at reasonable cost.

Conservation and renewal of the agricultural resources of the country are necessary. America is approaching the day when intensive cultivation of the soil alone will suffice for the needs of the population. Scientists assert that immediate action must be taken to restore to the soil its productive qualities.

Nitrates will supply this need. And one plant for their manufacture, more cheaply than they can be imported, is ready for service at Muscle Shoals. The other plant at the same place is partially completed. The completed plant isn't turning a wheel.

The farmer naturally wants his land to produce all it can, but the land must have fertilizer to produce the maximum, and nitrates are the answer to this problem.

The South realizes that not all the nitrates necessary for the farmers of the nation can be produced at Muscle Shoals, but it believes once the project is launched there it will be the beginning of a program whereby other plants sufficient to supply all farmers will be built.

during the war, which have lain idle for two years, as they appear today.

Economic Era Believed Near Power and Nitrate Project

richest agricultural district, with the fourth largest river on the continent seemingly pleading that it be put to the use of navigation, the South has come to see Muscle Shoals as the genesis of its new industrial life.

Not that the southerner believes for a moment that the factories he visions will all be placed at the midpoint. He hopes and expects rather that each little stream and waterfall in his whole picturesque territory will ultimately be put to its maximum practical use without the destruction of its scenic advantage.

But he has come to believe that the development of Muscle Shoals will signalize the dawn of his new industrial era. At the midpoint of the Tennessee River, Nature for decades has been offering ready made, vast water power. The rising of the people's needs functioning slowly through the machinery of government year by year has put to work one after another of the great natural resources with which the land abounds.

At last, reaching fruition at almost the moment the South's industrial ambition was keyed to its high point, the movement reached the Tennessee River power. It took the tremendous energy and enthusiasm of war time to inspire finally the development of Muscle Shoals power.

And it is unthinkable to believe that the government, having spent $100,000,000 in a vast enterprise, will permit it now to sink into uselessness, with comparatively little still to be done.

Great, indeed, as are the hopes of utilizing fully for manufacturing the Muscle Shoals water power, there are vastly more entrancing considerations which concern operation of nitrate plants, another aspect of the Muscle Shoals development.

Scientific research during recent years has been turned toward the task of conservation. The profligate use of coal and oil supplies has caused careful investigators to sound the warning that the world's supplies of those necessities are not limitless.

But until very recently *there has been almost no consideration of the question of scientific conservation or restoration of the soil*—a national and world problem on which depends the welfare of farmer and urban resident and, in fact, through the dietary necessities, of the very preservation of the race.

Farmers have struggled manfully with the problem of restoring to full vigor the over-worked and tired soils which have produced their crops. Fertilizing has been conducted in more or less haphazard manners and with greater or less faithfulness. The Department of Agriculture, studying the problem earnestly and disseminating its information to the limit of its possibilities, has during recent years furnished the farmers with much information on how best to conserve and restore their soil.

But information alone is not sufficient.

There must also be material with which to conserve or restore.

And that is where the nitrates come in.

America is approaching the day when the intensive cultivation of its soil alone will suffice for the needs of the population. Scientists insist that immediate action must be taken to restore to the soil its productive qualities. So serious a publication as the London *Athenaeum* within the past few months devoted much attention to the world danger of exhausting its nitrogen.

Theoretically, scientists maintain, light and heat will be exhausted some time. But the inhabitants of the world do not worry much about this eventuality, a matter of some thousands or millions or trillions of years. But, according to the *Athenaeum,* the matter of the exhaustion of the world's supply of available nitrogen is not only theoretically, but practically possible within measurable time.

Nitrogen is necessary to the dietary problems of the human race. It is necessary to all life, animal and vegetable. Man's only source of nitrogen is in the proteins he eats. The animal sources of nitrogen are confined to the plants they consume. The plants in turn must obtain their nitrogen from the soil, a fact which makes it clear that the ultimate source of all nitrogen consumed in maintaining life of all kinds, is the soil.

Nitrogen, once taken from the soil, can return only through the death and breaking up of the living thing into which it was transported. Decayed matter therefore becomes fertilizer and helps restore the soil from which it came. But it is easy to realize that a great portion of the nitrogen originally extracted from the soil does not return. Some is carried away in solution and goes to the sea. Some is transformed into non-edible plants and lost. The perpetual diminution of nitrogen must in theory and according to the *Athenaeum,* practically exhaust the soil unless some other means of obtaining it is applied.

It is all very vague and involved, this scientific dissertation on the exhaustion of nitrogen and its possible effect on plant and animal life. But, translated into plain language, it is a fact which the crudest of farmers knows with certitude. He knows that the continuous use of the same field to grow a crop of wheat will destroy that field's productiveness within a brief span of years, unless he renews the productivity by fertilizer.

Fertilizers have as their chief constituents, nitrates. And the obtaining of nitrates from sources other than the decay of animal or vegetable matter has engaged practical thought for years. And this thought could not help being directed toward the atmosphere above. For *four-fifths of the nitrogen is contained in the air. Only one-fifth is present in the soil or animal or vegetable matter.* It was natural for attempts to be made to recover that nitrogen in the air.

Which brings us directly back to Muscle Shoals, and the nitrate plants. One of these, the smaller, is still in the experimental stage. It was built for the utilization of the Haber process of extracting nitrogen from the air. The other, which has been proved a success by two months of practical operation, presupposes the use of the cyanimide process.

The important thing is the manufacture of nitrates which will enable the farmers, with the information, suggestion and instruction which the Department of Agriculture will eagerly afford, to obtain from their land its maximum production, and still maintain that land in normal condition of productivity.

The Muscle Shoals nitrate plants will not be the only ones in the country. Once inaugurated the nitrate business must become adequate for the nation's needs. But Muscle Shoals must remain as significant of launching a program which must grow steadily until the country has realized its possibilities in intense production of foodstuffs sufficient for the population which must be expected in future generations.

The great irrigation program launched in the West a decade or so ago was one great step toward making useful all the area of the country. It would be the height of folly if the nation should spend millions to reclaim acres of arid land, and then refuse the comparatively small expenditures necessary to conserve the fertility of the soil.

But southerners hold no fear that the country will abandon the great Wilson Dam, partly finished, and shut its eyes to the possibilities of Muscle Shoals power and the wisdom of providing for the perpetual re-filling of the national granary.

They believe that the picayune days of thought are gone forever. The nation has learned to know that national wealth is measured by its productiveness in useful and necessary things, rather than by a fluctuating thing called money. Taxes, indeed, are burdensome things, but real public improvements do not tax the country—rather they pay for their cost over and over again. But that is another subject. Just now, those who are considering the matter are attempting to visualize the immense possibilities which lie in the utilization of Muscle Shoals—possibilities embracing things all the way from lowering of freight costs to energizing an industrial people, all the way from conserving food supplies of future generations to helping in the solution of the country's railroad problem, all the way from the profoundest scientific researches to the farmer's decision whether he shall raise wheat or hay.

The ramifications of the proposition are too many to enumerate. They run together like the parts of a great machine.

And it was only yesterday that Muscle Shoals was unheard of.

Today, even, it is a mystery.

Tomorrow—who knows?

Tennessee River Power Second Only to Niagara

The Tennessee River, which the government decided to dam at Muscle Shoals, is second only to the Niagara in potential power.

The South wants to utilize this power to manufacture its own raw products in the South so that these products can be distributed more cheaply throughout the country.

Now the raw products of the South are shipped East, West and North to be manufactured. Too often these finished products are shipped back over the same routes for distribution. Such haulage is wasteful.

Completion of the Muscle Shoals project would eliminate this waste and expense. It would bring the factory close to the raw product, from which the finished goods would be shipped only once.

There would be no duplicate trips. The consumer would benefit through this saving.

For years the South knew the possibilities of water power in the Tennessee River, but the energy of war time was necessary to actually inaugurate the plan of harnessing this power. Nitrates are very necessary in the manufacture of explosives, and the government decided on Muscle Shoals as the place to erect two huge plants for making nitrates, the plants to be operated by water power from the Tennessee River. One plant was completed and operated for two months. Then the armistice.

The government expended $100,000,000 on the development, when all work was stopped. The South, nor the nation for that matter, cannot make itself believe that the great development, which means so much to the industrial and economic life of all the people, will be allowed to remain incompleted.

How Shipping Board Is Ridding Us of Ships

Concluded from page 3

the government to defend these suits when tried. There are 1,700 admiralty cases pending with *no evidence of record* to enable the government to defend the cases. Some of the cases involve as much as $17,000,000 each, and there are many ranging from $5,000,600 upward. Remember, the claims filed aggregate $350,000,000.

This cannot help but bring back consideration of the appointments made by Mr. Schlesinger, the $10,000 a year general counsel, who hired ex-Senator Sutherland to advise him.

According to Representative Byrns, of Tennessee, the "general counsel stated that he had not half started, because, he stated, that that (appointment of $260,000 worth of legal talent for cases under $75,000) was not half the force that he would require to complete his attorney personnel. And one of them stated that the attorney expense of this board would amount to between $500,000 and $1,000,000 every year.

"But that is not all. These men are employed on regular salaries. They look after claims under $75,000, but when it comes to the other claims special counsel are to be employed."

Invested $67,000,000; Rights Not Defined

MR. SCHLESINGER in his testimony explained that Senator Sutherland had been retained as "advisory counsel to me." On which Representative Byrns comments:

"In other words, he has this former United States Senator employed at $5,000 to advise the general counsel of the Shipping Board as to his legal duties."

Mr. Schlesinger, from a reading of the testimony given before the Madden committee, has full knowledge of the immense difficulties to which he has fallen heir in taking over for solution the legal problems of the Shipping Board. For instance, there is a story that weaves into the earlier operations of the Shipping Board:

Mr. Schlesinger: "Let me tell you about this Pusey & Jones case. As they told me the facts in New York —and I cannot vouch for their accuracy because I have not investigated it personally—I understand the United States Government put $67,000,000 into that company for the erection of a plant and the construction of boats, and as I am told there is not a stroke of a pen or a contract of any kind to show what our rights were in the premises, or what our contract for the construction of these boats was, and we are now being sued for $14,000,000.

The Chairman: "Have you any records in the Shipping Board that show that?"

Mr. Schlesinger: "I have not been able to find them."

It has even been brought out that to this day, despite the scandal that attended the earlier operations in the War Department under such a system, that at least eight of the 19 ships now under construction are being built under the cost plus plan.

Commander R. D. Gatewood: "The passenger ships are all being built under the cost plus plan."

The Chairman: "Will you be kind enough to state just what cost plus plan means in the way it is used by the Shipping Board?"

Commander Gatewood: "There are two cost plus plans now being used by the Shipping Board. One is a straight cost plus. That means it is cost plus a percentage of that cost accruing to the contractor as a profit."

The Chairman: "What is the percentage?"

Commander Gatewood: "It averages about 10 per cent.

The Chairman: "Is there a limit beyond which he cannot go in the matter of profit, under that plan?"

Commander Gatewood: "No; there is no fixed limit. It is very hard to give it to you because it is different in almost every contract, and there is no fixed point beyond 10 per cent or beyond 12 and one-half per cent, but the nature of it is such that he cannot do very much better than 10 per cent, and it will average 10 per cent or somewhat less than 10 per cent, as things stand now."

Mr. Buchanan: "Is there a limit on the cost of the ships on which this 10 per cent is to be figured?"

"Three and a Half" Boards

COMMANDER GATEWOOD: "No, sir; that is the whole trouble with the cost plus plan. At the time the contracts were entered into nobody would accept the ships on any other basis, because nobody knew where labor and materials were going, and they would not undertake the responsibility of building the ships with any limit of cost.

"The second cost plus system, which is the one under which most of the present boats yet to be delivered are being built, is somewhat better. It is cost plus a fixed fee, so much a vessel, plus a profit-sharing arrangement in the difference between the actual cost and a fixed limit on the boat. If we go over that limit, the government has to pay it, but we are not going over the limit in any of the vessels yet to be constructed, and we are going to be under the limit, so the government will participate half and half in the so-called profits; that is to say, there was an upset price set on the boats at so much a ton. The contractor gets a fixed fee for building the boat and then of the difference between the actual cost and that price we get half of it and the contractor gets half of it. That is a very much better proposition."

The Chairman: "That is, he gets one-half of the saving, in addition to his percentage?"

Commander Gatewood: "In addition to his fixed fee. It is not a percentage."

The Chairman: "What is the fee?"

Commander Gatewood: "About $50,000."

The Chairman: "On what size ship?"

Commander Gatewood: "On a 10,000 tanker."

Surely, the reader will exclaim, there must be assets, too! Everything in connection with the Shipping Board is not a total loss! Oh, yes, there *are* assets, besides the thousand steel ships tied up at various anchorages for large fleets, and the $430,500 the Shipping Board expects to receive from the New York corporation that has bought 205 wooden ships for less than the price of one.

One of the shipping boards—Mr. Madden has said that there have been "three and one-half" boards—undertook the construction of towns to house thousands engaged in ship construction. It is estimated that more than $65,000,000 was spent in this manner. Houses by the hundreds were built in New Jersey, Pennsylvania, Connecticut, Florida and Washington.

Mr. Wood, of Indiana, explained in considerable detail what the board did and what it is NOT doing in connection with the housing propositions:

"The Shipping Board built towns all over this country, all along the coast wherever they could find a place to build a town. There is one of them outside of Philadelphia, or just at the outskirts of Camden. I went through it the other day. I do not know how many thousands of people it will house.

"Many of the buildings are of a permanent character and all of them are occupied by somebody, *but nobody is paying any rent or has been paying any rent since activities ceased.* They paid $22,000,000 for building this town at Bristol, Pennsylvania. There is absolutely nothing being done there. Yet all of these houses have been and are occupied without a cent being paid in rental."

It has been estimated that there are $500,000,000 of assets, "which," says Representative Madden, "they (the Shipping Board) call 'live assets.' I would not call them very live. They consist of items like this: Past due notes, past due accounts; *rents of tenants that occupy whole towns that were created by the Shipping Board during the war, uncollected.* They have taken mortgages, some past due, taken on ships that were sold. They have claims for advances for assistance to those who took the contracts to operate ships.

Billions Appropriated for Ships

"ONE of the expert accountants....said that if we forced the liquidation of this $500,000,000 of so-called live assets, we would bankrupt a great many people in the United States and we would dissipate at least $300,000,000 of the $500,000,000 of accounts."

Up to July 1, 1921, the Shipping Board and Emergency Fleet Corporation had received in government appropriations more than three billion dollars, to be exact, $3,240,053,000. There were added allotments made by the President during the war, and this brought the grand total appropriated for these institutions up to $3,322,248,179.31, *approximately one-seventh of the money raised by this country for all war purposes.* In addition to the amount already set down, there was received from all sources, principally operations and the sale of ships, $1,477,011,542.41, which should be added to the more than three billions noted. The total reaches $4,762,405,089.39. The expenses attaching to sales, operations, cancellations, and so on, left the Shipping Board $3,084,060,247.88 to invest in the manner which has been revealed in these pages.

To obtain funds to maintain itself the board in the past has sold ships. Four hundred and two ships were sold. They amounted to 1,900,000 tons, and cost $320,000,000 to build. How much more was lost in operating them, if they were sailed, is not known, but the boats were sold for $260,000,000, a loss of $60,000,000. *Of this sale price, $130,000,000 was all that was received.* Not content with having lost the $60,000,000 noted, on the 402 ships, *the Shipping Board turned the $130,000,000 cash received into the construction of more ships.* What the ships built with this money are worth today perhaps can be determined from the selling price of the 205 steamers which together brought a price equal to the cost of building one ship.

The cost of maintaining the ships tied up is appalling. The wooden boats cost for five months, January 1 to May 31, $675,000, to maintain. It also cost $200,000 to bring them up the river to anchorage. It seems that the ships were gathered together and brought into Chesapeake Bay in units of four. These units were then split up, why it is not known, and each ship towed separately to anchorage. It is reliably stated that the pilots association charge for this service was a modest $1,000 a boat. But that was not all. After the wooden boats got to their anchorage in the river, their crews had to be paid off and dismissed. And when they left the boats everything portable went with them. It is said that hundreds of thousands of dollars' worth of instruments, including long-distance glasses loaned to the government by patriotic citizens upon promises of return, were mailed parcel post from the Claremont, Virginia, post office. It is known that compasses, and other instruments of a like character, were smashed to pieces to obtain the alcohol in which the needles were floated.

Some More Huge Losses

AFTER this wholesale looting by officers and men alike, stripping crews came along with barges, and tens of thousands of dollars more was lost when equipment indiscriminately was thrown over the sides of the ships into barges, thence to be conveyed to Hog Island.

Below Claremont is Camp Eustis. There three hundred and fifteen steel ships were tied up, with skeleton crews to maintain them. England, as has been known, has been suffering from a nation-wide coal strike. England needs coal. England appealed to the United States to ship coal to England. The United States—Uncle Sam the Good Samaritan—agreed to ship coal to England provided that England would furnish return cargoes. Oh, yes, England would —and did! So, according to the story as it is told in Claremont, one hundred and twenty of the steel freighters were reconditioned, filled with coal and sent to England.

They came back from England not with return cargoes, but in ballast, with ballast sold by the English at $6 a ton. When the ships got to Chesapeake Bay it cost $2 a ton to dump the ballast out. *The freight money for the coal did not pay for the reconditioning alone.*

There is much more to be told of Shipping Board operations. There is much more to the story than ever has been revealed. There is one person in Washington, who, if called before a senatorial inquiry committee—a committee prepared to get the truth and not furnish a whitewash—is reliably credited with having information enough of certain practices to send "twenty-five persons to prison."

The report that he made is an interesting document. It was furnished to the Shipping Board in the belief that an inquiry would be instituted. This was not done. And the chap who had furnished the information "resigned"—by request.

A certain Senator recently sought to obtain a copy of the report. He called upon the Shipping Board for the document.

"Certainly, Senator," he was told. "It will be sent over in the morning." Morning came but there was no copy of the report forthcoming. Inquiry followed.

"We are sorry, Senator, but that report is withdrawn from distribution. It cannot be had," was the reply.

A senatorial committee could obtain it.

The Oldest Thing Alive

Concluded from page 11

from them, when she dispatched a gust of wind that suddenly overturned the mammoth, with a mighty crash and shaking of the earth, while they were at dinner.

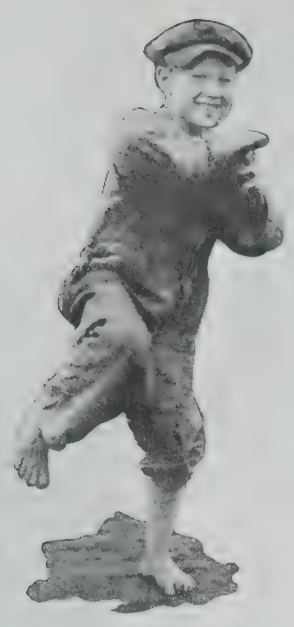
The owner obtained plenty of souvenirs by using the wood from the huge branches. After he had the fallen log smoothed, he erected a bowling alley and also a bar room thereon. The stump, fashioned into a pavilion, served each Sunday as a place for religious meetings; through the week it was a dance floor, a concert hall and a theater. For a time in 1858 *The Big Tree Bulletin,* a newspaper, was published there.

The Big Tree, sequoia gigantea or Washingtonia, is first cousin to the redwood or sequoia sempervirens. The species were named in honor of Sequoyah, a Cherokee Indian, who liberated hundreds of his tribe from illiteracy by inventing an alphabet of 85 characters that enabled them to read and write in the only language they knew, their own. When one considers that this great Indian has often been called the American Cadmus and the Modern Moses, it is plain that the trees were not dishonored by receiving his name; in fact, each is a monument to and a reminder of the other's greatness.

This aristocratic genus is found only in a narrow strip 250 miles long on the western slope of the Sierra Nevada mountain range in Central California. It prefers an elevation of 5,000 to 8,000 feet. Once the genus consisted of many species and flourished in the Arctic regions, as fossil remains show.

Stumps that have been exposed for centuries and trees that have fallen remain solid with a strength apparently equal to that of the green wood. Moreover, it has been said that if every one of the giant sequoias were to die today, numerous monuments of their existence would remain available for the student 10,000 years hence.

The shape of these giants vary with the age of the specimen. In youth they are arrowlike and resemble other conifers, but with the slow march of the years the lower branches are dropped and the upper ones thinned out until only a few remain. Because of the thinning the few wax larger, divide into numerous branchlets and end in masses of leafy twigs. As a big tree grows older its head gradually takes on the broad oval shape of a dome.



The sequoias bloom long before winter passes. The snow beneath them may be eight or ten feet deep, but they either do not know or do not care. Their small, pale green flowers are almost the first evidence that spring is approaching. They grow in thousands and millions, coloring the whole tree and the snow or ground below.

The grass-green cones are about three inches long and heavily laden with seeds, which fall like so many snowflakes on the foliage and deeply seamed bark. Some of the myriads of baby seeds sift through the vegetation and come in contact with the soil, sprout and grow. The tremendous reproductive power of the redwood is not shared nor possessed by the Big Tree; the seeds of the latter have a vitality so low that in a large proportion of the groves almost no seedlings can be seen. Even when the seedlings do get a start they may perish in a greedy forest fire or before a flock of sheep pasturing on the mountainside. Those that survive the vicisstudes that living entails may become not a hundred feet but a hundred yards tall and thousands of years old; it seems almost a miracle that the General Sherman, the General Grant, the Grizzly Giant and the entire sequoia host all sprang from tiny seeds about a fourth of an inch in length.

Almost without limit is the life of a sequoia. Fire may harm it, but rarely kills. The tree is practically exempt from disease. Storms worry it a bit; yet the ordinary bolt of lightning is something to be laughed at and forgotten. On life it has a most tenacious hold.

Humanizing the Health Center

By EARL CHRISTMAS

A live case from the outdoor clinic of the health centers

CLINICS — yes, there are clinics at the health centers in St. Paul. That is the usual conception of the health center. But there is something else at these health centers in St. Paul. There is play, and there is self-expression, which are community tonics, more valuable than any administered by the physicians in the clinics and just as health giving.

Every year some 8,000 men, women and children are given free medical attention at the centers, made possible through the bequest of the late Amherst H. Wilder. Thousands more are helped on the way to health by the visits of nurses. But more interesting, more significant many fold, is the human quality that runs through these unique enterprises. Located in three widely separated and congested districts of the city, where a little friendliness is apt to find the readiest response, they have come to hold a vital place in each community, all because the directors of the work have sensed in a very human way the needs of their neighborhoods.

The old dispensary idea is losing ground. Everywhere men and women engaged in the promotion of health or social welfare work are looking out, seeking new means of vitalizing their institutions in the eyes of the people. They are seeking ways to get closer to the people. At such a time, the experience of the Wilder health centers, founded on a new and unusual conception of the function of such agencies, must prove illuminating indeed.

For instance, there's that first rule of the health centers as set forth by Miss Florence M. Briggs, supervisor.

"Our first rule is to make friends," she explained. "That's more important than getting a bad tooth pulled. Oh, we are very informal. The center is one of the neighbors, you see.

"We are not afraid to yell out of the window to the woman next door, and she calls back and we talk over the back yard fence. Perhaps we will go over and borrow her wash boiler, and she may come over and borrow our tubs.

"Being friendly is the important thing. Clinics and health follow in their places.

"Many of the people out in these congested districts are starved for a means of expression—not of the body, but of the spirit, the group, the community. It is the same in every large city. They love music. They love to dance. They love beauty, color, motion—and they don't know it. They would do anything to express themselves, in a proper way; and if not in another way.

"Some of them haven't had any fun all their lives. They have been working always. Some need play, just play, more than any other tonic. And so we are trying to fill all these needs. We are trying to give the people opportunity to express themselves, in play, in dancing, social activities and in educational channels. We are not handing anything out to them like a dispensary. They are coming to us and demanding these things, and we are giving them to them.

"You will find the friendliest people in the world right out around these health centers. I don't know—I suppose that it would be the same in any other part of the city, or in any other city. It just seems that the health center brings out the innate friendliness that one always will find in people if you stop to look for it, or do something to prompt its expression. They are square and ready to meet you half way. You have to be friends, and the rest is easy."

Indeed, the health center in St. Paul has attained fully its ambition to be a friend to the neighborhood. To ascertain the truth of that, all one has to do is to take a walk down one of the dingy streets in the neighborhood. From all the porches one will hear messages yelled by youngsters of many and varied nationalities, and greetings by mothers as many and varied.

"'Lo Biggs," or just "Piggs," yell the youngsters too little to say "Miss Briggs."

She is the chief adviser, promoter of recreation and the final arbiter of disputes to some 600 boys and girls who play in the health center games and clubs. She is a counselor of mothers, hurrying from one health center to another, dropping suggestions here and there along the way. In fact, she is something of a mother to three congested districts of the city, who need a community mother very much.

So, with the others on the health center staff. When one of the nurses makes the rounds of her neighborhood, she comes home laden with gifts. One family may give her some oranges, and another a couple of eggs, while a third will have some dainty prepared for her to eat. Nor can the nurse discourage this, for that would hurt the feelings of persons, who prize beyond words this opportunity to show their appreciation.

Just the other day a woman came into one of the health centers, and, with tears in her eyes, said in Polish:

"I don't know any prayer that is good enough to say for you people."

So, they come often to the health centers, which makes it easier to see why the centers can be so friendly.

Then there was the case of an elderly woman who came to have her teeth pulled one morning. While she was waiting, a nurse spoke of having received some lilies of the valley, and the doctor said he liked flowers. As soon as this woman got through—she had all her upper teeth taken out—she hurried home to her garden and picked some flowers. She came all the way back to the health center and gave the flowers to the doctor.

"God bless you," she said, "I will."

The health centers are veritable mines of interest to those who appreciate the human things that people do.

One little girl not long ago was furious because the doctor pulled her tooth before she knew it. She cried, for she wanted to save the tooth and take it home to her mother. The doctor had to do a Highland fling for her before she would stop crying. That is characteristic of the health centers, by the way—the doctor stopping his work to do a Highland fling to induce the girl to stop crying. Being friendly is more important than getting a tooth pulled, you see.

Then, there was the lad of four who informed the dentist after his tooth had been pulled:

"You are pretty good. The other dentist down town was rotten. When I grow up, I am going to be a dentist and be good to kids."

And then this from a little girl:

"I don't want any teeth filled. My mother got all hers out. I am 10 now, and I might as well begin on mine."

So run the pictures in the daily kaleidoscope at the health centers. Miss Briggs and her assistants can sit and talk to you for hours about the humorous, the pathetic, the human things that people do. That's one good way to test the human element in an institution, by the way. If you find that its directors appreciate the human things, if they can laugh at the funny things that have illumined their work, or can sense something of the sorrows and disappointments of people, you can be pretty sure that institution is close enough to its patrons to be of excellent service.

From morning until night, the St. Paul health centers are vital centers of activity in the communities in which they are located. There are clinics, gymnastic classes, club meetings, games and social meetings from 10 a. m. until 9:30 p. m. Even the married women have their gymnastic classes, and they enter into the contests with as much zest as the youngsters of three or four years.

"There is one woman of 68 in the classes who never has missed a meeting," said Miss Briggs.

"She's as young as any of them. You see, the class started out to do general gymnastics, but the women got too enthusiastic. They had to have some competitive athletics. That's the way things work out. Now they have their newcomb team and play match games with other teams.

"When you stop to think about it, there is something significant in this. These married women get down on the floor and do all kinds of exercises, really strenuous exercises. For the most part, they are women of two classes. Either they weigh more than 200 pounds, or they weigh 100 or less. They want to reduce or build up. So we fit the kind of exercise to the purpose of the individual. Some times it is a little strenuous, but they are all good sports. If you could drop into one of the health centers one day and find the married women of the community rolling on the floor, you might be surprised a bit at the spectacle, perhaps amused a little, but you would learn one thing, and that is that women like to play. And it's good tonic for them, too."

Each year the health centers hold an annual field meet, another unusual feature of the new health center. Married women were among the most enthusiastic, if not the most active contenders for the prizes at the 1921 meet held recently. Some of the women had sons and daughters in the meet. One woman with snow-white hair was among the most zealous of the aspirants. There was a relay race for fat women and a relay for thin women.

Here were these married women, some of them weighing 200 pounds or more, running races and playing games with as much zest as their daughters. Some of them even tried the high jump.

That is characteristic of the work of the health centers. Boys and girls have their clubs. They have their games and their contests, culminating in the annual field day events, where they have opportunity to win the prize Health Center button. Even the husbands have asked for classes, catching the infectious atmosphere of the center from the women.

But what has all this to do with the health center, and health? The work of a health center—the health center of the new order—is as wide as the needs of a community, and so every activity that contributes to the individual or community health properly may center there. That is the theory of the St. Paul centers.

At first the centers started out to give corrective gymnastics, and from general gymnastics to athletics the transition was natural. There followed also a demand for the esthetic, and dancing and music entered the centers, and social and educational classes.

So much for purposes. Results are more interesting. Every child in the districts around the centers has come to cherish the Health Center button, which signifies that he is physically fit, or that he is willing to do something to become fit. Little ones too small to go to school, will toddle into the health centers and say, "I want to be physically fit."

During the influenza epidemic in 1918, there was but one case of serious illness among the 400 members of the health center classes. After the epidemic, the University of Minnesota sent word to one of the districts, informing it that this district was the best controlled district in the Twin Cities and asking for the reason.

"It wasn't good nursing, though we had good nurses," Miss Briggs explained. "It was the spirit of the people, the way they co-operated with us."

In those trying days, Miss Briggs herself took an automobile and went from house to house with food. In one district alone, the center cared for 230 cases of influenza in the homes. Boys from the health center classes went with Miss Briggs, carrying food to the sick. Other boys trained in the health center classes patrolled the district daily. Sometimes, they found whole families ill with influenza—but not a single boy on the volunteer staff contracted the disease. You see, they were physically fit. Of the 230 cases of influenza in the largest health center district, but two deaths occurred, which redounds somewhat to the credit of the health center nurses and their impromptu assistants, recruited from the boys on the playground.

Above, left—Two married women coming in on the finish of a 100-yard dash—yes, it's a part of the new health center. Above, right—This picture, taken at one of the health centers in St. Paul, ought to prove a good sermon on the value of play as a community health tonic. Below, left—Girls can do the high jump, the health center has found. Below, right—Girls going through corrective drills at the annual meet of the health center.

BRIEFLY TOLD

Preservation of the boyhood home of Nathaniel Hawthorne, in Casco, Maine, is the object of the Hawthorne Community Association, which has been incorporated at Portland in that state.

New blue sky laws in Massachusetts require security sellers to register an account for all their offerings.

A crow lighting on a heavily charged wire was instantly killed and fell a blazing mass into a field of uncut hay near Spencerport, New York. The hayfield caught fire, causing a loss of several hundred dollars and threatened adjoining wheat fields, whose uncut crops were estimated to be worth several thousands. The Spencerport fire department rushed to the scene and prevented further damage.

Egret breeding is an established industry in India. The plumes are plucked from the living birds and are available in large quantities. Especially prepared aigrettes are hawked in the streets of Calcutta and sold at very high prices.

Ten sticks of dynamite dropped from between the ceiling and the first floor to the basement of the Pacific hotel building in Spokane while workmen were making alterations. The dynamite was so old it failed to explode. It was wrapped in a newspaper bearing the date of 1899.

The American Embassy in Buenos Aires is located in the upper floors of a building occupied by a carpenter shop, mattress factory and a woman's tailoring establishment. Gaudy-colored mattresses on one side and women's dress forms on the other mark the entrance, and a dark spiral stairway leads to the small waiting room above.

Blistered hands, caused by handling of pick and shovel after months of striking, made it necessary for thousands of Nottinghamshire coal diggers to lay off for a few days until they became hardened to the work. Coal dust entering the blistered hands caused intense pain.

Seven hundred miles on foot—said to be the longest march ever attempted by an American military organization—will be covered by the Third Infantry Regiment, when the soldiers travel from Camp Perry, Ohio, to their new station at Fort Snelling, Minnesota. The marchers, with full equipment, will have about 40 days in which to make the trip.

Human hair importations have dropped from 222,000 pounds to 7,000 pounds a month due to the new fashion of American girls who are bobbing their hair. The Chinese have for years been exporting great quantities of hair to the United States.

A dense, white smoke screen, more impenetrable to vision than any known, has been invented and demonstrated at Camp Meade. The secret of the new invention is being guarded closely by chemists and army officers directing its use.

Hidden three months in an unfilled water tank of a steamship, 26 emaciated Chinese stowaways were recently removed to Ellis Island from a British steamship. The discovery was made by a customs official searching for contraband liquor and opium.

A drug route on which narcotic deliveries were made regularly after the fashion of ice and milk deliveries, was disclosed recently in New York City, when officers arrested three delivery men and seized a route book containing 88 addresses. An automobile and a quantity of narcotics were taken at the same time.

Photographs taken from the air and plates developed while flying are regarded by aviation officers as possessing high military value. A photographer flew from Bolling Field and returned a few minutes later with a plate developed, showing clearly the parade of students attending the citizens' training course near there.

Burning corn instead of coal for fuel this winter is the plan of Minnesota farmers, who are attempting to mature the largest corn crop in the history of the state. With no prospect for a market and with railroads maintaining abnormally high freight rates on both coal and corn, the farmers find this to be the cheapest way out of the difficulty.

"Sourdoughs," who headed the famous gold rush to the Klondike in '96, recently held a reunion in Dawson, Yukon Territory, to celebrate the Yukon's twenty-fifth birthday. The crowd was made up of prosperous-looking men who had struck it rich and grizzled old prospectors who still follow the game. Rugged old-timers renewed old acquaintances and swapped thrilling yarns of the late nineties.

An 18-foot candle will burn 5,000 years as a memorial to Enrico Caruso. Every All Souls' Day for 5,000 years this candle will be lighted. It weighs 1,000 pounds and will require ten weeks to make it. The maker has erected a derrick in his shop by means of which the candle is dipped thrice daily into boiling tallow. It will be placed in the Church of the Madonna of Pompeii at Naples.

Tourists have been conscripted by the Royal Northwest Mounted Police to fight a severe forest fire north of Waterton Lakes Park, Alberta.

Baseball is displacing the wrestling game as Japan's national sport. Japanese baseball fans are always silent during the game. A home run on the third strike with the bases full—and the fans merely smile and nod their heads.

A fish that chews its cud like a cow is known as the parrot-fish and is found in the eastern Mediterranean. These fishes possess certain pocket-like extensions of the membrane of the mouth in which they stow their food while grazing, so to speak, later seeking a quiet place where they chew the contents of the pouch.

Acetylene for singeing chickens, if properly used, performs this operation in a very short time, without scorching the skin or heating the flesh.

Personal notes and documents of Field Marshal Earl Haig, of immense national and historical importance, have been given into the charge of the trustees of the British Museum, with instructions that they are not to be opened until 1940.

Lighthouses as bird sanctuaries along the English coast have proved a boon to the migrating birds. The Royal Society for the Protection of Birds has had placed on the lighthouses long lines of perches around the lighthouse gallery and on the dome. At migration time thousands of birds sit in long rows on the perches instead of beating against the glass dome as they formerly did.

An airplane fire engine, carrying chemical fire extinguishers and pumps, driven by the airplane motor, recently succeeded in extinguishing a considerable fire near San Francisco, before the fire department reached the blaze.

"Water cold. Lost canoe, August 9, K. L. Shiras. Finis. Love to all at home." This was the farewell message scratched into the rocks by a Canadian, in a stony, wave-beaten cave at Squaw Bay Point on the desolate shores of Lake Superior, where he had been marooned during a heavy storm. Fishermen found him clinging to the rocks exhausted and wearing only a shred of a bathing suit.

Ruins of a great temple have been unearthed on the southern shore of the Gulf of Corinth. Pillars and foundations indicate that the temple was built by the Dorians who captured the ancient town from the Ionians and held it for several centuries.

Music to improve the morale of workers who work into the small hours of the morning has been tried out in the Minneapolis post office and proved a success, according to Postmaster-General Hays. It is said that at quitting time the employes are more alert and less tired and worried than before the installation of the phonograph.

Wealthy drug addicts in New York City have received letters from the head of the narcotic squad, in which they are told that they must either take the cure or face exposure. Exposure, if it comes, will reveal names high in the artistic and social life of the city, among them being several millionaires, a noted composer of popular songs, novelists and screen stars.

Thirty-one hundred portable houses are being shipped to Northern France and Belgium by an American company. Scattered among the ruins of stone cottages many centuries old, new, brightly-painted, frame houses will spring up over night.

Closed Doors—Why Conference Will Prefer Them

By A. R. PINCI

DURING the half a hundred years since the modern periodical has become the main and generally the only source of information about national and international relations available to citizens of civilized countries, and by which, for better or worse, they temper their thought and attitude toward one another, their leaders, commonly called statesmen, have dreaded the printed word. This instinctive antagonism is truly a phenomenon, because it is no respecter of persons or nationalities. It thrives in many American minds as it does in European and oriental minds. Despite the state of advanced publicity existing today in this country, that group which has been predestined to statesmanship is only occasionally friendly to freedom of the press, and not a few individuals are distinctly contemptuous of its mission. The only time publicity is desired is in the event of a great personal success; the only time publicity is wooed is in the event of a mistake or defeat, when it is resorted to, with all the wiles statesmen are capable of using, to break the news gently, generally to the taxpayers. This, briefly, spells the difference between pitiless and pitiful publicity.

It will be remembered that about this time seven years ago statesmen in many European countries were deluging the reading public with an overwhelming mass of so-called information about who started the war and why. It is a fact, however, that prior to August, 1914, the selfsame statesmen were diametrically secretive, and what facts or circumstantial evidence became of record was solely due to journalistic enterprise. It was an incomplete and necessarily imperfect record. This the common people did not begin to realize until after they regained their bearings in the midst of war.

In due time a movement was inaugurated in favor of unlimited publicity. President Wilson devised the term "pitiless publicity," although he himself never interpreted its meaning. The people liked the sound of it and so they championed it. Other statesmen seconded it. International affairs were thereafter to be washed with printer's ink and hung out to dry in the light of public opinion.

Realizing that abridged publicity—the kind daily allotted to the reading public, which is information authorized by officials in power, as well as propagandist publicity, which is information "inspired" by the same individuals—was perilous to the public welfare, by the time the war was over oppressed taxpayers, speaking the same thought in a dozen languages, demanded pitiless publicity as their share of victory. Inasmuch as representative government "for" the people, if not in every case "by" the people, was to be the war's gift to humanity, pitiless publicity would enable the common people to become partners in government.

A prolonged and bitter controversy, which has led nowhere, raged about the failure of pitiless publicity during the progress of the peace treaties of 1919, upon which it was to be tried first of all. Something of an identical controversy has been started recently in connection with the forthcoming Disarmament Conference to be held in Washington, under the auspices of President Harding. An attempt was made in the Senate to make publicity compulsory by legislation, an attempt that failed but that has left a cumulative political effect.

Since publicity is demanded now even about publicity itself, it was a foregone conclusion that the Disarmament Conference should be requested to deliberate in public. As no auditorium could accommodate even a fraction of the audience that would seek admittance to so interesting a debate, a public conference would mean, therefore, one to which the public press should have free and uncensored access. This, offhand, seems a simple thing, and it should be a simple thing, but the fact is that it is not. And precedent is as much against it in the United States as it is abroad. It is worth while, as a result, to examine the problem dispassionately both in theory and practice. It would be too much to expect foreign delegates to the conference, the majority of whom (if the names so far mentioned are a criterion) are politicians and nothing more, to participate in a discussion that within a few hours would be placed verbatim before a few hundred million readers. They are not used to it. For foreign statesmen to speak in the presence of press stenographers would be tantamount to silencing their lips. The realization that their remarks would be subject to the immediate review of an anonymous reading public, a part of which would be nationally hostile, would confuse them.

The disarmament conferees expect to get publicity—personal advertisement—out of the conference. This greater fame lures them. But as to their speech making, they expect that to be a very solemn function. There will be no galleries to speak to, as it were, but nevertheless a certain dramatic spirit will enter into the proceedings. I doubt if even the most experienced speakers will deliver extemporaneous remarks. Quite likely every speech will be carefully prepared in advance and perhaps read from manuscript. But it is a cold-blooded statesman who reads his own remarks verbatim. No matter how slight, the change is just what the experienced correspondent seeks out, because frequently it furnishes the key to the real meaning between the lines. It dwindles to a contest, but the journalist wants to do his own discovering.

View of the Pan American building and grounds in Washington, where the Disarmament Conference will be held.

The foreign delegates to the conference will be in a peculiar position; so peculiar that up to the time of writing the most surprising news has been the series of conflicting reports as to who will be present. They want to come, Europe's notables, but they hesitate. There is a reason for their hesitation, which is this:

The conferees will play a dual rôle: they must appear to the American nation as sincere friends of humanity, which means championing disarmament, but at the same time they do not feel free to set aside the national aspirations of their respective countries, some of which might be nullified by a successful disarmament policy. The government or the people for whom each speaks will expect him to favor a so promising tax-reducing step, but none knows so well as a European diplomat what those people would say if disarmament meant a corresponding voluntary abandonment of expansion policies. Likewise, returning without being able to promise substantial relief by the new means will not be a straight road to public favor. In any event the average European statesman feels that he has more to lose than to gain by participating in the disarmament conference.

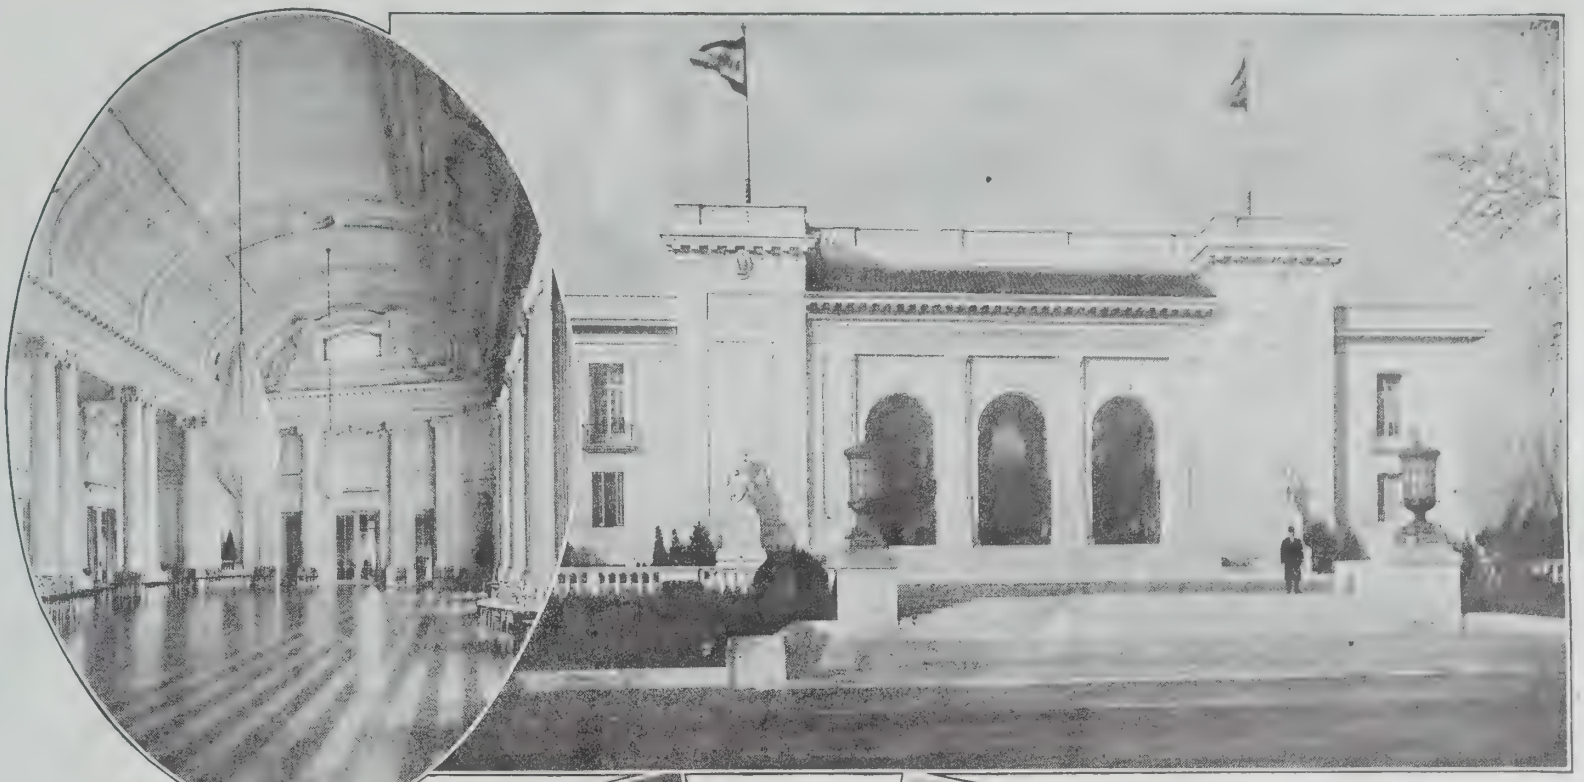
Publicity of the conference proceedings is, at best, a relative term. Probably not more than two or three newspapers throughout the United States would attempt to publish a complete verbatim report. Not one in a hundred readers would peruse such complete reports intelligently. The introductory news paragraphs and editorials would single out the statements worth while, which is about all that the layman is interested in. It is not a problem of publicity in the sense that the press wants to print everything. In fact, in these days, publishing the reports of such a conference, even in limited form, is a drain on space.

The real reason for the demand for publicity is the fear that unless responsible national correspondents are given the freedom of the hearings, with discretion to use that which in their estimation seems of greatest importance, the official press representative of the conference will pass out stereotyped and probably deleted (if not doctored) reports.

It is obvious that official press reports would be of a monotonous uniformity if the newspapers throughout the country were to rely simply upon the official releases. It would be a dangerous method, too, because it would oblige many ambitious writers to seek recognition by an undue use of "dope," of imaginary situations, of interpretations, of declarations by "a high authority," and all the manipulations available to more or less clever writers.

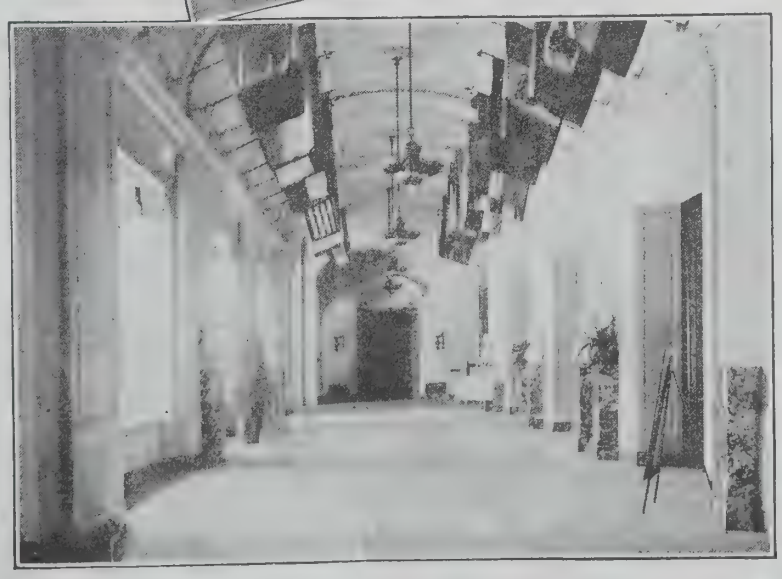
Conference-tailored reports, as a result, would be preceded by an indifferent attitude on the part of the reading public, not to mention the disgust of responsible editors and correspondents. This indifference would assist materially those who wish the conference to fail of its object, as the people understand that object, without causing the violent reaction of disappointed expectation.

Certain newspapers, which in the Senate are dubbed "administration" papers, openly favor the secret method. Apart from the fact that these newspapers are the recipients of a gratuitous fame not in accordance with the facts, it seems indeed surprising that they should oppose unlimited publicity, especially if the trouble be taken to look back through their files two or three years and compare their erstwhile denunciations of the so-called Wilson secretiveness. Whence and why their anti-professional attitude?



These newspapers contend, briefly, that (a) President Harding has called the conference, thus guaranteeing the motive; that (b) American interests will be safeguarded by Secretary Hughes, Senator Lodge and probably Mr. Root; that (c) the American public may blindly intrust itself in their keeping; that (d) famous foreign statesmen will represent the great powers in this great cause, and that (e) the discussions will be more or less technical and therefore uninteresting to the public. The conclusion is reached that the foregoing reasons are sufficient to permit the public to take its chances and to permit the conference to proceed without benefit of press.

These conclusions are fundamentally traceable to the accepted type of hallowed diplomatic reasoning. But nothing has so far been said by the President which would warrant one in deducing that the Disarmament Conference is to be a diplomatic conference. No secrets are involved. *Every government knows to a nicety the extent of the other's armament. The problem before the conference is to decide how much to curtail it, and if possible how much more to reduce it by destroying some of it.* The only diplomatic phase involves the nationalistic policies of those governments, the extent to which they would be affected, if at all, by partial disarmament. These policies are known; and the only complication might arise from the desire of some delegate to be overzealous, which is improbable.



As to the identity of the probable delegates, their position at home may be discounted outright. Public opinion in France and in England, in fact, is crystallizing against officials in office participating in the conference. The belief is growing that *statesmen of the old school, in of-*

2. Give both *old* and *new* address.
3. Write clearly.

Disarmament First!

IN THE tendency to "broaden" the scope of the Disarmament Conference to meet at Washington in November there is some danger of sidetracking the great main issue. Written or unwritten alliances, the formation of a new "association of nations"—even the settlement of the now open problems of respective rights and duties in the Far East—important as they may be, are all properly subordinate to the one distinct object of the conference and the clear and imperative demand of a war-weary world for the practical step of restricting and limiting naval armaments.

The suggestion of Secretary Hughes that the conference should occupy itself with the question of restricting or prohibiting the more "inhuman" methods of modern warfare that horrified humanity during the last war, and that are very certain to be fearfully multiplied and intensified in frightfulness in the next war, should there be a next war, is emphatically beside the question. Such restrictions come well within the existing "regulations" of the Hague Tribunal. Yet experience has shown that, in the fever and madness of actual warfare, they quickly go by the board. *All* war is inhuman. It is simply inevitable that it should become more and more fiendishly brutal in its methods with the intensification of the search for more and more destructive agents that war always stimulates.

In truth, this suggestion of the chairman-elect of the American delegation is irresistibly suggestive of the brilliant scheme of the man who cut a large hole in the barn door for the cat and a small hole for the kittens.

Let us make sure of disarmament, and there will be no need of "regulating" frightfulness. Disarmament first! No sidestepping!

The Mania for Waste

THE food sent to the bottom of the ocean and the foodstocks burned in the field or in surrendered towns during the World War would probably suffice to feed the starving millions of Russia, Austria and Poland for a year. Because of the devotion of steel, lumber, cement and other building materials to the fashioning of shells and other instruments of destruction during five long years, the world is just now suffering a house shortage running into the millions.

Paper shortage that compelled the cutting down to a minimum of the publication of books, magazines and newspapers and doubled the price of those to be had at all was brought about by the devotion of the available wood-pulp supply to the manufacture of explosives. That the belligerents might have plenty of gun-cotton, the world went ragged and naked. So on, all down the line. Taking these wastes into account, the estimate of the cost of the World War at 300 billion dollars might easily be doubled.

Suffering as humanity is today from this war waste and destruction, and facing the gigantic and exigent task of economic rehabilitation, one would suppose that there would be keen appreciation of the vital necessity for intelligent conservation of our resources. Yet the waste of war-time seems to continue in peace-time without assumed excuse. The recent suggestion of the chairman of the Shipping Board that the wooden ships that cost the taxpayers some three hundred millions might be towed out to sea and sunk is illustrative of a general mental attitude.

People on both sides of the Atlantic seem to be seized with a perfect fury for wanton waste on a large scale. A little while ago the papers were full of pictures of the destruction of thousands of German airplanes. The careful dismantling of these structures, it might be supposed, would answer every purpose. But there was no thought of saving out perfectly good motor engines and other fittings. Motors and propellers, wheels and framework made of valuable materials and on which months of careful labor had been spent, were doomed to utter smashing.

The corner druggist will charge you 75 cents for the half-pint of very weak grain alcohol you buy to rub sore muscles or a rheumatic knee. But millions of gallons of confiscated alcoholic liquors from which this valuable alcohol might readily be extracted for use in medicine and the arts is run into the gutters every little while by government officials, to the glee of the small boy and the disgust of the toper.

Sometimes the waste is not deliberate and of malice prepense, but flows from what may well be termed criminal carelessness and neglect. The French people have always been regarded as pre-eminently thrifty and frugal, "living well on what Americans waste." But this virtue cannot be imputed to their bureaucratic government. It is estimated that of the hundred million dollars' worth of army stores sold to the French Government by the United States for ten millions (payable any old time), about 50 per cent was spoiled and destroyed in the year following the armistice by preventable fires and lack of protection from the weather. And this at a time when there was acute food scarcity in all France and a general outcry against the high cost of living! Perhaps an investigation of the disposal of our surplus army and navy stocks at home would reveal similar recklessness in the wasting of our substance.

It is about time some one started a vigorous anti-waste movement. The proverb, "waste not, want not" may be hoary with age and trite from repetition, but age has not withered nor custom staled its unquestionable wisdom.

Japan's Cue to Lloyd George

TELEGRAMS from Tokio to London tell us that the feeling in Japan is strongly that the continuance of some form of "written assurance of the close relations between Britain and Japan" would have for its more valuable effects "an encouragement to Japan to co-operate ever more closely with the United States."

It is significantly affirmed in addition that, "in certain cases of unwise action on the part of former Japanese governments with regard to China, it was only necessary for Great Britain to suggest a line of conduct for Japan to mould her policy in accordance with the suggestions of her ally."

Good! This practical repudiation of the former wicked administrations which are responsible, say, for the retention of Shantung and the invasion of Mongolia, as well as for the iniquitous "Twenty-One Demands" that would reduce China to vassalage, makes Mr. Lloyd George's next move easy. The affirmation is a virtual invitation for him to tell Japan that the restoration of Shantung, the evacuation of Mongolia, cancellation of the notorious "demands" and recognition of Korean autonomy would be a "line of conduct" eminently pleasing to her western ally—and the rest of the world.

A Tax on Cash Transactions

THE general dissatisfaction with the present income and excess-profits taxes is measured in some degree by the number of plans proposed to obviate the evils these taxes impose. Somewhat in line with the suggestion, recently discussed on this page, of a tax on bank clearings as a "single" Federal tax, to take the place of all other Federal taxes, is the plan now proposed by C. P. Landreth, of Philadelphia, and which has already received the commendation of business men and bankers, lawyers and manual laborers.

Mr. Landreth suggests a tax on all money transactions above 50 cents. With much reason, he argues the need of a stable and certain basis for taxation, even though the rate may be an adjustable one to meet varying needs of the government. He would begin with a tax of one per cent, and would include not only the money transactions represented by bank clearings—which amounted to some $450,000,000,000 last year and on these alone would yield a revenue of $4,500,000,000—but also on minor transactions. By deducting one cent on all transactions between 50 cents and one dollar, he thinks a fair average on transactions below 50 cents would be made up. To simplify bookkeeping, he would continue this averaging process all along the line, taking two cents on transactions between $1 and $2 and so on.

This simplicity of assessment and collection of such a tax is its most attractive feature. It would perhaps be the least objectionable form of a sales tax. It would be widely distributed and stimulate rather than retard business. That its burden would be passed on to the ultimate consumer seems likely; but what form of taxation is free from that objection?

State Medicine

STATE ownership and control is perfectly sound in theory, and has proved itself wholly unsound in practice. There may be countries in the world where it is safe to trust the control of vital interests to the group of men who comprise the government; it has not always been safe in this country, as years of experience prove. The revelations of official incompetency, and not so much incompetency as dishonesty, during the recent war period, will effectually modify any theoretical appeal which the idea of state control may have.

But that there are influences in this country which are bent on bringing all the people's affairs under official scrutiny, is most apparent from the efforts now being made to create a sentiment in favor of "state medicine." This means simply: more jobs, no privacy, curtailment of freedom, the destruction of the medical profession by the discouragement of research work, and the coarsening of delicate intimacies. It means practically that what the United States Shipping Board did to the shipping situation of the country, "state medicine" would be permitted to do to the people's health.

The most astonishing feature of this propaganda is the assumption that the proposal *could* be made attractive to the American people. Most cities have city physicians now, and most counties have county physicians, and no one rests under any doubt of the quality of the services rendered. The public has had a wide experience in going to its officials for sufficient water, heat, light, school facilities, transportation service, and sufficient difficulty in getting any kind of service at all at any reasonable tax rate, to prevent its falling in love with the idea of going to its officials for medicine when it is sick. Practically, it will not work; the genius of the American people is against it.

Between family physicians and families there is a confidential relation which rests on choice and experience. It is not official. It is not altogether professional. It partakes of the confessional in large degree, and constitutes a friendly pact based on the experience of many fights with disease and death. So well recognized is this that the family physician has become a fixed figure in our lives, and with results of undoubted good, as the records generally show.

To change all this and establish a police health station, as it were, at which citizens must apply for medical aid and await the pleasure of an official doctor who is paid anyway and whose professional career does not depend on the confidence he is able to evoke by skilled and loyal service, is to suggest something which is so alien to our Americanism as almost to prove an alien course and an alien purpose.

With the growing predilection of a certain group for medicine and surgery, and with that group's constant predilection for securing control of the intimate sources of the people's confidence and strength, there is no doubt whatever as to what complexion "state medicine" would take if it were adopted.

These are times when more than at any previous period the American people must be on guard against *ideas* that are not American. The time has come for the exercise of a wholesome defensive suspicion about many things that outwardly are made to appear desirable, but inwardly conceal dangers to our fundamental traditions and liberty. And we are never more justified in our suspicions of alien influences for an alien purpose than when we see attempts made to "regiment" the American people or their private affairs.

A Waste of Silver

PERHAPS our readers have noticed the emergence of the "dollar of the daddies," the dear old silver cart wheel, in the circulating coin of the realm. During the month of August, the Philadelphia Mint coined six million silver dollars, which is 1,710,000 more pieces than were coined in any preceding month of this year. And the mint is still running exclusively on silver dollars to replace the pieces which were melted down under the Pittman Act, so that the resulting bullion, on the suggestion of Rufus Isaacs, Lord Reading, then Special Ambassador, and now Indian Viceroy, might be sold to the British Government below the market price and "on tick" to supply the demand of India.

Under the act, the 270,000,000 silver dollars so melted down are to be replaced by new purchases of the white metal, the product of American mines and smelters, at the fixed price of one dollar a fine ounce. This is a good thing for the owners of silver mines—for the Guggenheims especially. But why are the taxpayers put to the expense of coining the silver? We have got along without this cumbersome coin very well. Its paper representative has proved much more convenient. Why are the mints just now concentrated on the cart wheels to the neglect even of subsidiary coinage? Is bimetallism to be restored? If so, in whose interest?

Mr. Ford's Page

THERE is a disease known as "swelled head" which may be contracted in any line of activity, but which is particularly dangerous in business. Because of the inelegance of its name and the commonness of its occurrence among light and giddy youth, it is regarded as not a dangerous disease, but something light, like the ailments of childhood. We know, however, how serious the ailments of childhood can be when they attack grown persons.

If we were to be very strict about words, we should perhaps say that the term "swelled head" was hardly descriptive. If the head of the patient actually should enlarge and his brain power increase, the disease would not exist. It is the feeling of enlargement in heads that have not enlarged nor expanded at all, that constitutes the abnormal condition.

That is to say, the condition described as "swelled head" is a delusion—the patient thinks he has expanded when he has not. The only element in him that has increased is his self-esteem, and when that increases out of proportion to everything else, there comes an unbalanced condition which is just as dangerous to his affairs as insanity is to society.

This ailment is not confined to men in small and unimportant positions, although it is found there too; but it is frequently found among men whom the world thinks to be "big men" because they wear big titles and *deal in big things.* There would seem to be little reason for much swelled-headedness among the "big men" of today, for it is precisely in their fields that all the big failures and all the big humiliations have come.

There is, of course, such a thing as a sense of self-satisfaction in one's work, a sense of being able to do the thing required, a sense of mastery, and a plain knowledge of having accomplished something when a good job has been done—these are the wholesome flavors and reactions of honest work. They are not to be confused with the disease of "swelled head." The difference between them is this: the former has the work for its center; the latter has one's self for its center. And self-centered persons (not necessarily selfish persons) are in great danger of letting themselves get in the way of their work. They are in great danger of the delusion that their work exists for their glory.

The sign of a little man is so various that it is next to impossible for an ordinarily observant person to mistake him. He never forgets himself. He is afraid to surround himself with bigger men than himself, with men who know more, or who can give him help. Thus the little man is a fool: if he knew where his interests lay, he would surround himself with the biggest and best men, and by his just treatment of them retain their services. But the little man lives in daily dread that somebody will show up more meritoriously than he, and he strives to keep a false pre-eminence by seeing to it that, little as he himself may be, those who surround him are smaller still. This is often true because the little man is usually himself a subordinate who fears displacement. But even a subordinate who can surround himself with superior and efficient assistants is not in nearly so much danger of displacement as one who deliberately hammers down the standard of his organization.

The disease of "swelled head" has its preliminary symptom in shortsightedness. No one who can see very far ahead or very far around, is ever troubled with it. The world is so big and there is so much to be done that a man can contract "swelled head" only *by comparing himself with himself.*

Is not that the trouble? The process is usually something like this: a man goes to work earnestly and intelligently, and as a consequence his work attracts attention. Any man who works this way is bound to make an impression. In course of time this man is advanced, and the recognition thus accorded has the effect of making him still more earnest and intelligent, and therefore more useful and desirable. So another advancement inevitably comes; and perhaps another, and another.

Then one day, the man stops to consider what has befallen him and the idea creeps into his mind that he must be quite a fellow. Look what he was *then,* and look what he is *now!* Comparing himself with himself, you see. It is the first whisper of the tempting serpent.

The man receives his last advancement—and usually it is his *last*—with the feeling that at length he has arrived. He has ceased to regard every new step as a new challenge to his ability; he has come to regard it as a decoration pinned on him for what he has done sometime in the past. As a result, he sits down to enjoy his new place and his new title—and his degeneration begins right there. He has caught "swelled head" and the treatment needed to cure that is often very drastic and severe.

Where did the disease begin? In the man's thought that advancements are decorations instead of new challenges. Nobody has "arrived" until he has filled his post and is leaving it—only then can a judgment be rendered on his work.

Can you imagine a newly elected President of the United States entering the White House with a smug smile and saying to himself, "Well, at last I have attained success—I have arrived—I have become President"—can you imagine that? Oh, no, for just at that moment there would come thundering through the corridors of his soul the cutting challenge—"What kind of a President?" Ah! —that is a question to be answered after four or eight years of service.

The President does not arrive until he leaves; it is then his record is made; it is then his measure is recorded on history's page. The exalted position is sometimes only a loftier stage upon which to enact a tragedy of failure.

It is true everywhere if you are promoted, it is only another burden, another demand laid on you, with the questions: "Can you carry that? Can you fulfill that?" The reward for good work done is always more work. Not decorations, nor titles, nor "soft snaps"; these are the snares which have wrecked many a career.

It is better to remain a good bookkeeper and to be known as such, than to be promoted because you are a good bookkeeper and think that you can dispense with the qualities that made you a good bookkeeper. Unless you take those qualities with you, enlarged and intensified, you are only ascending the scale to a more spectacular failure. Promotion that is not regarded as a challenge to greater and better performance may easily become a snare.

We want to write the word "success" too soon. It should be kept for the epitaph. Any man who thinks he is a success, has come to his terminal. He is about ready to get off. He is running under the momentum of past steam. He is coming down with a form of "swelled head."

One fact about this disease should be noted: it does not always take an offensive form. It does not always show itself in bumptiousness. A man may be a victim of it and yet never suspect it. When a man settles back as if he had done all he ought to do, when he begins to have the deliciously drowsy feeling that, after all, he has done pretty well—it is time to be on guard. The disease is not unpleasant to the victim and therein lies its danger. He should distrust such thoughts and go on a hunt for something hard and difficult and "impossible" to do—something that will bring back a normal sense of proportion.

NOT all cases of "swelled head" are bumptious and offensive. Many men contract dangerous disease without knowing it. It is very agreeable to its victim, it soothes and satisfies him. It has numerous subtle forms which should be learned and rigidly avoided. Some people get "swelled head" by winning promotion: they think the promotion is a decoration pinned on, instead of a challenge to carry heavier burdens and fulfill more exacting demands. You don't measure success on arrival, but on leaving. Arrival is only opportunity, it is not achievement. People with "swelled head" think it is achievement, and in the end the delusion destroys them. A sense of proportion cannot be preserved by comparing yourself with yourself.

LEW SARETT

Lew Sarett, Poet of the Wilderness

By ROBERT H. MOULTON

WHEN a man turns down an offer to lecture on the platform at $300 a week and all expenses, for a job as forest ranger at $100 a month and his board, it means something. In the case of Lew Sarett it meant a chance to "come up to breathe." What is money when a man who has lived the greater part of his life in the wilderness is offered an opportunity to get away from stuffy lecture halls on hot summer nights, back to snow-capped peaks, tumbling mountain streams, limpid lakes, murmuring pines, grizzly bears, bob cats, porcupines, and fried trout and flapjacks of his own cooking in the open!

Lew, it should be understood, was not overburdened with this world's goods, and when the proposition was first put to him by a certain renowned Chautauqua for twelve weeks at the rate mentioned, he saw instantaneously that it meant $3,600 in his pocket. He also saw with equal quickness that it meant frequent and tiresome hops by rail, cheerless hotel rooms, meals served on white tablecloths, and a host of other things that go to make up our modern civilization. And from these things he instinctively shied. The result was a quick jump to the nearest telegraph office and a wire to the chief ranger of the Yellowstone that he would take the next train West.

So it came about that during the summer of 1920, Lew Sarett, a duly appointed ranger, traveled the wildest and most dangerous patrols in the Rockies, his days and nights filled with adventures and his heart singing "This is the life," and that's why thousands of persons missed hearing from his own lips the story of thrilling adventures in the pathless Canadian forest; of wilderness folk and wilderness ways; of trails, tepees, and tenderfeet, the whole topped off with a selection of his remarkable poems of Indian life.

It is as an interpreter of Indian life, of the red man's thoughts, moods, his customs, his legends, his symbolism, his natural mysticism, that Mr. Sarett has made his greatest impress on American literature, an impress which seems destined to grow with the years, for he is only 33 and virtually at the beginning of his career as a poet. For ten years he worked in the north country among the Indians as a guide and woodsman. He became their friend and three years ago was received as a member of the Chippewa tribe. He learned their traditions, superstitions, problems, needs, their songs, chants and dances, and the result is that in his poems he visualizes the Indian as never hitherto painted.

Since he was 15 Mr. Sarett has had what might be called a fairly busy and crowded life. He has had experience as a guide and teacher of woodcraft, canoeing, swimming; college athletic director and coach; tutor; debater; member of the Great Lakes life saving service; forest ranger; teacher of business law, public speaking and English; political speaker; writer; professor, and professional lecturer. He holds degrees from Beloit College and the University of Illinois, and has done post-graduate work at Harvard and Michigan.

In the simple statement that Mr. Sarett earned the money for his education lies considerably more than the words themselves express; lots of men have done the same thing, but he did it in a decidedly unique way. Also, he acquired his education in the face of tremendous odds. Lots of men have done that, too; but, aside from such ordinary handicaps as lack of funds and having to go to work to help support the family while he was still a boy in knickerbockers, there was for Lew Sarett the constant and overwhelming call of the woods. For the first 10 years of his life he had run wild in them; had come to feel the need of them almost as much as the need of his mother. It was something of a transition, then, from the boy's paradise on the Upper Peninsula of Michigan to the basement of a Chicago department store, carrying bundles at the munificent salary of $2.50 a week!

"Lord, I'll never forget that experience," he says, "although it might have been good training for me—teaching me how to repress my natural feelings and tackle the job at hand in a calm and bus'nesslike way."

Lew Sarett seems to be one of those rare mortals who is born with a love for everything wild—trees, flowers, fish, animals—and who is never very happy except when among them. He confesses that during his school days on the Upper Peninsula it was about 50-50 between attending classes and playing hooky, to get into the woods; but at that, he always got high grades.

"I showed my instinct for the woods early," he confesses. "My earliest memory in this connection relates to a time when I was about four. I used to walk off with part of my breakfast packed in a little salt sack of muslin. I treasured it as a kind of pack sack. Right after breakfast I'd slip out of the house and hit for some low thick bushes in the farthest corner of the yard. I'd beat my way into the heart of them, and I'd stay there alone sometimes for hours, having the time of my life building rock piles, looking at the ants and bugs, or just sitting.

"Now all the money in the world will never get me away from them for any length of time."

After a couple of years in Chicago, matters straightened out a bit and Lew found himself once more back in Michigan; back to the open, with woods, rivers, lakes, fishing, rabbits and things to hunt, snares to set in the winter. There was also work in the high school, athletics, football, track work—three happy years of it and a long step on the road toward an education. When 18 he began to hit to the woods in Northern Wisconsin, working there during the summer months as guide, ranger and teacher. The third summer it was farther north, up to the Canadian border, through Ontario, Canada, around Northern Minnesota, in the Superior National Forest. In all of the 11 years he has lived in the woods he has paddled something like 12,000 miles, over the Lake Superior waters, the Hudson Bay country, the Mississippi. In 1913 he accepted a position as assistant in the rhetoric and public speaking departments of the University of Illinois, the position giving him much time to work on his law degree, which he earned in 1916, his summers being spent in the woods as usual. From that time forward his advancement was so rapid that in 1918 he had earned the position of associate in English and public speaking at Illinois. For two years he held that position, leaving in 1920 to become associate professor in the school of oratory at Northwestern University, which position he held until last spring when he received a full professorship.

It was in 1916, however, that his big chance came. He was offered an opportunity to lecture about the primal wilderness as he had seen and known it.

"Well, I was a bit fussed," he confesses. "You see, I had heard only one Chautauqua in all my life, and I had only two days in which to prepare my talk. But I went at it and whipped together my ideas of what a lecture should be."

The result was a lecture that was entirely different from anything people had ever heard before. Its uniqueness and freshness, plus the lecturer's own personal charm, created a sensation in platform circles, and at 27 Lew Sarett found himself one of the youngest and most successful lecturers in the country.

He admits that he never had any idea, when he was working in the woods, that he would ever write about the North or lecture on it.

"I was just a plain roustabout in some ways. My friends were, are yet, and ever will be, lumberjacks, guides, Indians, and some of the wealthy tourist folk I piloted through the woods. I learned to respect and admire the two-fisted cussing men of the backwoods. They are genuine; no snobbery, no affectation there.

"As to the Indians, I've come, as I got closer to them and learned to understand their customs, superstitions, religion, language, I've come more and more to see the beauty of it all. About this bronze figure, the symbol of our vanished West and of our beaten borderlands, hovers a wild poetic beauty as peculiarly American in fragrance as the redolence of burning pine."

Mr. Sarett does not concede that he ever had any exceptionally thrilling experiences during his years in the woods and disclaims even any symptoms of heroism, but those who know of his exploits do not agree. The several medals he has won for saving the lives of drowning persons speak for themselves in the matter of bravery, while many of his adventures in the wilderness, which he mentions so casually, vie with the exploits of some of our best wild west movie heroes.

He mentioned a meeting with an old she grizzly and three cubs, when the only weapon he had was a pocket knife.

"I was standing on top of the peak looking over the country when all of a sudden, coming around the rim of a draw 100 yards away, I saw the biggest silvertip I'd ever run across, an old she that would have weighed close to 1,000 pounds, and at her heels three scampering cubs. She was moving slowly toward me, scratching under the rocks for bugs which the cubs gobbled up as fast as she found 'em. It was a fine chance to study a grizzly, so I sat down and watched. Pretty soon the old lady got my wind, looked up once in a while, growled now and then, but went on turning over stones, gradually working closer to me.

"At the end of half an hour she was only 25 yards away, and I began to study the land to see where the best retreat lay, also to locate a tree in case she charged suddenly; a black bear can shin up a tree as quick as blazes, but a grizzly doesn't climb trees.

"All of a sudden the bear disappeared in a little draw 20 yards away. I couldn't see which way she was going, but I could see the cubs running, following their mother, no doubt, and they were coming in my direction! That meant the old bear was trying to sneak up on me in a hurry. I left."

The point is, how many men would have sat there, unarmed, and calmly watched that bear for half an hour when he might have made his get-away in safety as soon as he spotted her. I thought it suggested a lot of courage.

"Courage! I don't know about that. It may have been pure recklessness. It seems to me that tackling a dangerous job is often not only recklessness, but pure bravado."

Although Sarett's versatility is remarkable, and the range of his interests runs all the way from shooting rapids in a birch bark canoe or talking Chippewa at an Indian council, to teaching the technic of poetry in a classroom or discussing a problem in economics with a crowd of college professors, he keeps his long list of vocations, avocations and hobbies harnessed and going together in one direction. He rides the bunch, and none lags.

Many Many Moons—By Lew Sarett

Red-Rock, the Moose-Hunter

Bronze in the rose-dusted twilight,
A statue of bronze, arms uplifted,
He stands ankle-deep in the lilies
As rigidly fixed and as silent
As a red granite butte on the prairie,
As still as the dusk in the foot-hills—
"Ugh! Red-Rock, big hunter-of-moose!
Red-Rock, him fool-um old bull!"
Red-Rock, big moose-killer!—Ugh!"
Bronze in the tranquil sunset,
Statuesque bronze in the willows.

The Loon

With mournful wail from dusk to dawn
He gibbered at the taunting stars—
A hermit-soul gone raving mad,
And beating at his bars.

The Wolf Cry

The Arctic moon hangs overhead;
The wide white silence lies below.
A starveling pine stands lone and gaunt,
Black-penciled on the snow.
Weird as the moan of sobbing winds,
A lone long call floats up from the trail,
And the naked soul of the frozen North
Trembles in that wail.

Above—Lew Sarett "packing" on the wilderness trail. Below, left—Lew Sarett and his pet bear "Jimmie" in the Yellowstone, 1920. This was a "tame-wild" bear. Below, right—Lew Sarett at his lookout in the Yellowstone.

The Problem of My Watch

By WILLIAM ATHERTON DU PUY

DR. A. F. BEAL,

Of the Bureau of Standards, is the government's expert on timepieces.

"MY WATCH is out of repair," a friend I met on the street said to me. "Where shall I take it?"

Now, that was a simple question, yet it stumped me. I could not recommend a good watch repairman. I wondered what guidance there was available for the man who made this inquiry. I conceived that there were many people in the nation who were asking this question. I set out to find the answer. Being here in Washington, in touch with the vast sources of information developed by the government, I turned to our Uncle Sam. And here is what I found:

The watches of the nation, the timepieces which its citizens wear on their wrists, pin on their shoulders or cache in their vest pockets, are going to pot. There are some 30,000,000 or 40,000,000 of these ticking timepieces distributed among the multitudes in the United States, each approaching the time when it will need repair. There are 15,000 new watches sold in the United States every business day in the year. Each of these starts out bravely on its run, but each, sooner or later, needs a bit of tinkering to keep it in condition.

And when that day of tinkering comes, the chances are twenty to one that it will meet its partial undoing, and each time it goes back for repair it will suffer additional atrocities. This melancholy prophecy is based on the crying fact that this great nation is almost entirely without competent watch repairers to meet its needs. There are three or four watches in the United States to every automobile, but there are fewer watch repair stations than garages and these that exist are largely incompetent.

I got the facts on which I base these assertions from that official who is the authoritative specialist of the United States Government on just this subject. Not many persons are aware of the fact that the Federal Government, among the many services that it renders to its people, makes a study of the timepieces they carry in the interest of punctuality. In the Bureau of Standards, however, that great scientific agency of the government, there is a timepiece section, and in charge of that section is Dr. A. F. Beal, who devotes himself to the problems that revolve about clocks and watches. Dr. Beal is a man of science, originally an astronomer, long with this technical bureau. He has grown up with its timepiece work and has become its authority.

Dr. Beal is an horologist, for such is the term, little known among the masses, which designates the student of timepieces. There is an Horological Institute of America, which was but recently created and which revolves about the National Research Council, a semi-public agency. This Horological Institute of America was created for the exchange of information in its field and for the encouragement of the development of efficient watch garages throughout the nation. This latter task is its principal immediate concern. Here is the situation, as Dr. Beal, in the Horological Institute, finds it to exist.

Some individual, among the 100,000,000, purchases himself a watch. It is a first-class watch, for America manufactures watches of quite excellent quality and imports as many as she manufactures. The imported watches come largely from Switzerland and Austria and generally they are of pretty good quality. A first-class watch, if given proper attention, should last its purchaser 50 years.

This watch runs for a year or two years and some small part of it may get out of adjustment, or some accident may happen to it, or it merely comes to need cleaning. The owner has no information as to how to proceed in the circumstances. He is likely to drop in at the most convenient jewelry store and leave this excellent timepiece in the care of the man behind the counter. This man may be competent for the task in hand, but the chances are twenty to one that he will turn out to be a watch butcher and that the watch will come back to its owner very much worse injured by its visit to the jeweler than it was by the circumstances that had disarranged it before that visit. The Horological Institute asserts as a fact that the average lifetime of a watch, which should be 50 years, is today in the United States four years. This institute charges up this shortening of the life span of the timepiece to the repairmen of the nation. The watches become unreliable from being tinkered to death, and finally are abandoned for new ones.

There are few competent repairmen working in the jewelry stores of the United States. A repairman with the glass screwed into his eye is recruited from one of three sources. The first of these is from the American boy who begins work in the jewelry store sweeping it out and running its errands. This boy becomes the jeweler's assistant and gradually picks up the detail of watch repair as it is practiced in that shop. The jeweler is a busy man and he teaches the boy just enough that he may be able to tinker the watches that come in and get them to ticking again—merely ticking.

The second source of repairmen is from the American boy who goes to a special trade school which teaches the watch-repairing craft. At the Bradley Polytechnic Institute in Peoria, Ill., there is a course in watch making that is quite worth while. There is another at the Bowman Technical School at Lancaster, Pa., and another at the New England Jewelers' Institute, of Milford, Mass., which is owned and operated by a group of enterprising New England jewelers. These and similar schools are turning out from 300 to 400 trained men a year.

The third source from which repairmen come is from the foreigners who find their way to America, but who have grown up in Switzerland, or Austria, or Germany, in the watch-making industry. In accordance with the adage that the best workmen do not emigrate, more poor watch repairmen have come to this country than good ones. So, when I asked the Bureau of Standards and the Horological Institute of America how my friend should proceed in the selection of a watch repairman, those agencies were hard put to give me helpful suggestions. A jewelry store of good standing and reliability, and whose advertisements are worded conservatively, is more likely to have a good watch repairer than is a flashy, fly-by-night concern, but even such jewelry stores are very prone to commercialize their work and be satisfied with making a watch merely run. In general, stores or small shops having reduced prices on repair work should be strictly avoided. It sometimes happens, however, that an old foreigner tucked away in a musty shop may be the best watch repairer in the town.

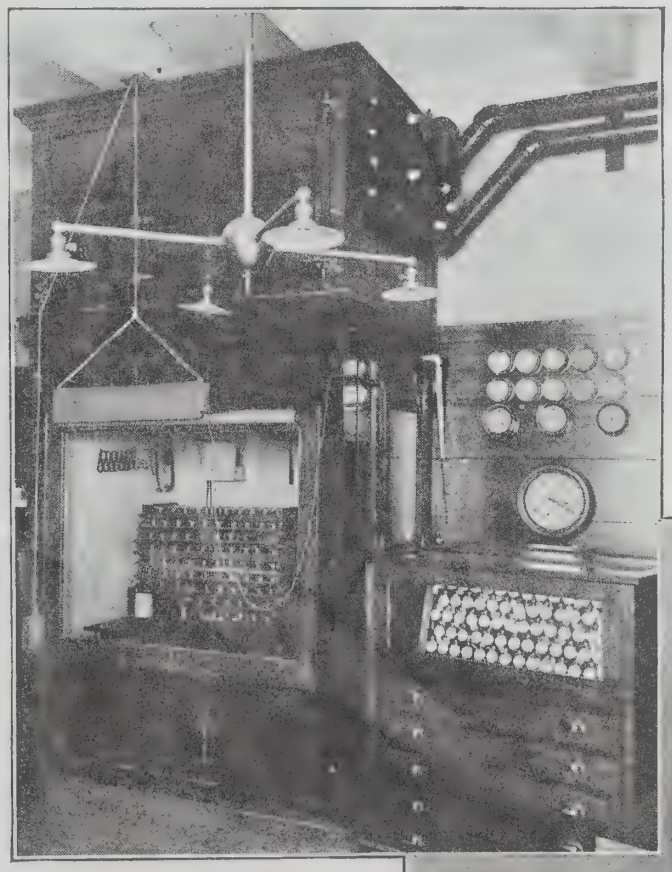
The Horological Institute of America is going out on a campaign to supply this crying need for competent watch repairers. The institute proposes to help the individual owning a watch by establishing a standard among repairers and offering certificates of competence to all those who measure up to that standard.

I asked this government expert on watches for some advice as to the manner of timepiece one should own and the manner in which it should be worn. I wanted to know, for instance, about the wrist watch, which has grown in favor since the days of the war.

"The wrist watch," said Dr. Beal, "has one important thing in its favor, which tends to make its use more than a fad. One may get at it to ascertain the time more readily than at a watch worn in any other position.

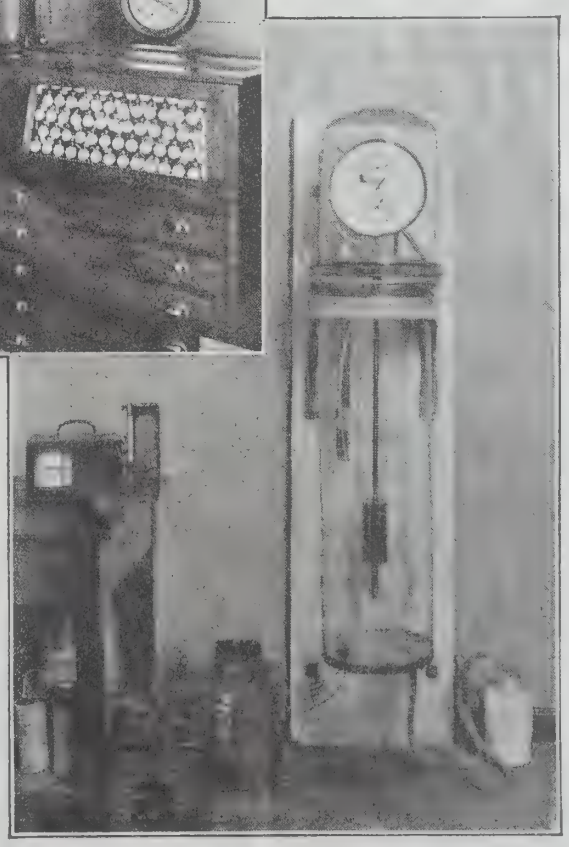
"On the other hand, there are two points against the wrist watch as a timekeeper. In the first place, it dare not be made large enough to contain parts of sufficient size from which to build a first-class timepiece. There is the additional necessity in a wrist watch of making some of these parts particularly strong that they may resist the unusual jars to which it is subjected.

"The second difficulty about making the wrist watch a good timepiece is due to the fact that it is constantly changing position. A watch, to keep good time, must be separately adjusted for each of the positions it occupies. A good watch is adjusted so that its error is small between any two of five separate positions. Naturally, it is harder to keep a watch running accurately for these five different positions than it would be to keep it running accurately for a smaller number of positions.



"The watch carried in the vest pocket spends about two-thirds of the time in an upright position in that pocket and about one-third of the time lying flat under the owner's pillow. If it is made to run properly in these two positions, it will keep fairly good time. The task of meeting the constantly changing positions to which a watch is subjected when on the owner's wrist is very difficult indeed. The popularity of the men's wrist watch has already largely passed.

"The problem of women's watches is even more difficult than that of men's watches, because, in the first place, they are generally smaller, and, because, in the second place, women have no such convenient place in which to carry a watch as a vest pocket. The watch pinned on the shoulder of the wearer occupies a fairly satisfactory position."



The government, at its Bureau of Standards, will test any watch for any citizen and give him the results of this test. The bureau maintains a clock, a very peculiar clock, which is probably as accurate as any clock in the world. It keeps this clock in a vault all by itself, tucked away in an obscure basement, where very great care is taken to maintain an unchanging temperature. The clock is enclosed in a glass cylinder and this is converted into a partial vacuum. The most delicate method of regulating a clock that is known to science is by controlling the density of the atmosphere in which it works. This clock is regulated by letting in or taking out a little of the air in its glass cylinder. So it is possible to get an accuracy in this timepiece within one-hundredth of a second a day and which means that this clock would not vary more than three seconds a year.

A peculiar thing about this remarkably accurate clock is the fact that it is wound every 30 seconds. If it were allowed to run 36 seconds, without being wound, it would stop. It is run by a little weight and when that weight reaches a certain point, which it does every 30 seconds, it makes an electrical contact which winds it.

The ticking of this marvelously accurate clock is recorded by an electrical device and carried over switches through various parts of this great scientific bureau where accurate measurement of time is required. In the time section, for example, the ticking of this clock goes steadily on and there is a machine which registers its measure of the moments on a chart. When a watch comes to the bureau to be tested one of the first things done with it is to hitch it up to this same machine and thus allow it to write the record of the time it keeps alongside the record made by this accurate clock. So are its deficiencies shown. Then the Bureau of Standards tests the time kept by this watch when it lies on its back, or its face, or stands upright, or on one edge or the other. It shows just what this watch lacks of keeping time in these various positions. These are facts of great value to a large purchaser of certain sorts of watches, to an importer, or to an individual who has just purchased an expensive new watch and wants to know if it is good. A fee of $1.50 is charged.

The government's plant for testing watches.

This clock at the Bureau of Standards would vary but three seconds in a year.

How the Jews Use Power—By An Eyewitness

Dr. Peters, of the University of the South, Tells What He Saw Where Jews Claim Rule: A Confirmation of Common Charges: The Jew a Bad Master

THE Jewish Question continues to mount the scale of public attention, attracting ever a higher type of mind to the discussion of its significance. When THE DEARBORN INDEPENDENT first began to print some of the results of its research into the Question, the initial response was largely from those who disliked the Jew because he was a Jew. This class expected to find in THE DEARBORN INDEPENDENT a spokesman for all their coarse humor and abuse.

The method that was followed by this paper, however, was not abusive enough, nor bitter enough to satisfy Jew-baiters and Jew-haters, and gradually a new response from another class began to be heard, which by this time has attained massive proportions. The better class of people, seeing that racial and religious prejudice had no part in the work, began to consider the Question with relation to our American life and the future of this nation as a Christian people.

An American Scholar States His Views

UPON this ascent of the discussion to its proper plane, the better periodicals began to give thoughtful attention to the matter. These publications have been referred to in previous articles. There is to be added to the list the *Century Magazine* for September, which contains an article by Herbert Adams Gibbons which clearly intends to be fair and is certainly able, in spite of a difference of opinion that might exist with regard to some of the author's conclusions. Mr. Gibbons states some matters more plainly than they have been stated outside the pages of THE DEARBORN INDEPENDENT, and some matters he states just as plainly; and he will be justified by the unprejudiced reader.

One of the most notable studies of the Jewish Question has come out of the University of the South, at Sewanee, Tennessee. It is entitled "Zionism and the Jewish Problem," the author being the Rev. Dr. John P. Peters, formerly canon residentiary of the Cathedral of St. John the Divine, Morningside Heights, New York, also rector emeritus of St. Michael's Church, New York, and professor of New Testament Languages and Literature in the University of the South. The article has been reprinted from the Sewanee *Review* and makes a brochure of 29 pages.

Dr. Peters begins with an historical sketch of the development of the two lines of thought among the Jews, the nationalistic which made for exclusiveness, and the religious which made for inclusiveness, and he describes the domination of the latter by the former with the coming of modern Zionism which he finds to be racial and not religious. He says "the dominant control of the Zionist party is at present in the hands of those who are not religious but merely racial Jews." He believes that the development of race-consciousness along these lines "must be inevitably in the end to make the Jews bad citizens of the United States or of any other country and to keep alive and increase the hostility to the Jews . . . ."

This monograph by Dr. Peters will repay study. By permission, THE DEARBORN INDEPENDENT reprints the article from page 20 to the end, this portion being selected because it deals with Dr. Peters' testimony as an eyewitness of certain conditions in Palestine: (The italics are ours, there being none in the university reprint.)

Jewish Intolerance From America

"THE experiment of the Zionist homeland is now being tried. It is too early to determine fully how it will work, but it is at least of interest to consider its manifestations so far. My earliest contact with Zionism and Zionistic influences in Palestine dates from 1902. When I first visited Palestine, in 1890, the Jews in Jerusalem were almost exclusively of old oriental Sephardic families. Jerusalem was then still the old Jerusalem within the walls. There were no houses without. Jewish colonization, economic and philanthropic in character, had just then begun on the Sharon plain, but what little there was in the way of colonization was a feeble, unsuccessful exotic—an attempt to replace the persecuted Jews of Russia on the land, where, however, the Jew, unused to manual and especially farm labor, sat under an umbrella to protect himself from the sun and engaged native Syrians to do the work.

"On my next visit, in 1902, more colonies had been planted, and a serious effort was being made to turn the Jewish colonists into farmers. The majority of the Jews who had come to Palestine, however, were settled about Jerusalem, and the new Jerusalem without the walls was larger, in space at least, than the old Jerusalem within. The Alliance Israelite had developed there splendid schools to teach agriculture, and manual and industrial arts. I was urgently solicited by the management to visit and inspect these schools. Here I found Jew, Moslem and Christian working side by side without prejudice. This was, in my judgment, the best work of any sort being done in Palestine, for two reasons: first, these schools were teaching the dignity and the worth of manual labor, which the oriental of all sorts had theretofore despised, regarding it as unworthy of any man of intelligence or capacity; secondly, because they brought Moslem, Christian and Jew together on a plane of common work and common worth, the most valuable agent for the breaking down of those ancient prejudices, religious, racial and social, which have been the curse and the bane of the land.

"I was asked to put this down in writing because, I was told, *great pressure was being exerted—I regret to say, especially from America—to prevent the management from continuing this particular work* of teaching Jew, Christian and Moslem on the same plane, the demand being that the Jew should not be brought into such contact with the Moslem and the Christian, and that he alone should be trained, that he might not be infected, as it were, by the others, *and that they might not be prepared to compete with him for possession of the land. This spirit I met in a more thoroughly organized and offensive form on my latest visit in 1919 and 1920.*

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

Difficult to Get the Jew to Work

"I FOUND immense progress in the development of agricultural colonies. There was still difficulty in persuading the Jew, except only the African or Arabian Jew, to do the actual work of the colony, but colonies were prospering, and fruit-culture, vine-culture and especially the manufacture of wine and liquors on a grand and most scientific scale, had progressed wonderfully. In general, the land occupied by those colonies was not in a proper sense ancient Jewish land. They were on the Sharon and Esdraelon plains and in the extreme upper end of the Jordan Valley; but those regions were being enriched, and the country at large benefited by the colonists. The great bulk of the Jews were still gathered in Jerusalem as heretofore, and there were on one hand the intellectuals and on the other the parasitic or pauperized Jew, what would ordinarily be regarded as the very best and the very worst. Life in the colonies was often very sweet and very lovely, a wholesome, normal family life, and an exhibition in peace and prosperity of what religious Judaism at its best may be.

"In Jerusalem one found the extremes of intensely narrow and bitter orthodoxy, and unbelief with extreme Bolshevik radicalism. Here, too, aggressive Zionism manifested itself in an attitude of bumptiousness and aggressiveness. The country was for the Jew. It belonged to him and he would shortly take possession. One was made to feel that one's presence in the land was objected to. The Hebrew press contained angry diatribes against the existence of Christian schools and missions. The attitude taken by these Zionists at first alarmed, then aroused and irritated enormously, the native population, both Christian and Moslem, making the Jew an object of dread and hatred as he had never been before. I had opportunities to talk on intimate and friendly terms with leaders in all camps, albeit I was unable, through language difficulties, to communicate with the rank and file as freely as I should like to have done. I myself felt the annoyance and in some places the danger of the animosity aroused. Under government order I was not permitted to visit certain sections of the country on account of the raids or uprisings of the Arabs, partly due to animosity roused by their apprehension of the Jewish invasion, and partly due to banditry, which took advantage of that as an occasion. In other parts it was difficult to travel, because any stranger, unless he could prove the contrary, was suspected of being an agent of the Zionists, spying out the land for possession by the Jews. It was difficult to obtain lodgings or food, and there were sometimes unpleasantly hostile demonstrations on account of these suspicions. Everywhere it was believed that the Jew by unfair means was seeking to oust the true owners and to take possession of their land.

"In Jerusalem it was asserted that the Zionist funds, or the Jewish funds which the Zionists could influence or control, were used to subsidize Jewish artisans or merchants to underbid Christians and Moslems and thus oust them by unfair competition, and that similar means were being used to acquire lands or titles to lands. It was even believed by many that the English authorities were unduly favoring and helping the Jews in these endeavors, as is shown by a letter from a Christian in Jaffa published in the *Atlantic Monthly*:—

> "'We are already feeling that we have a government within a government. British officers cannot stand on the right side because they are afraid of being removed from their posts or ticked off.'

Zionist Funds Used Against Christians

"FROM time immemorial the Jews the world over have contributed for the help of pious Jews in Jerusalem and the other sacred cities, Hebron, Tiberias and Safed, the so-called *halukha* or dole, in return for which the Jews in those cities were to win merit for themselves and those who contributed to their support by study of the law, prayer and pious observances. St. Paul carried over the same practice into the Christian Church, causing alms to be collected in the different congregations to be transferred to Jerusalem for the benefit and support of the Christians living there. To this day annual collections are taken in the Roman Catholic churches throughout the world which go to the Franciscans for the same use in Jerusalem. The Greeks and Armenians have like customs. In the past there had been no prejudice with regard to these doles, but now, it was claimed, the Zionist committees were using the moneys thus collected or contributed to organize and help their people in a systematized attempt to gain the upper hand in the land.

One Face for Jews—Another for Gentiles

"PERHAPS the attitude of the extremists who possessed the dominating power in the community can best be shown by the utterances of one of their own organs, written in Hebrew. (It should be stated that *the English edition of this journal was, as a rule, quite different in its contents from the Hebrew edition.*) One article, entitled 'Malignant Leprosy,' is a denunciation of parents who allow their children to go to any school except those under the control of Jews and conforming to the demands of the local Zionist Committee. Parents are notified that a list has been made by the Zionist Committee of all children who are attending foreign schools, even though they are not subjected to any religious teaching, and it is demanded that they shall be withdrawn from those schools and placed in schools where they shall be taught the Hebrew language, customs and traditions, and kept separate from contamination by the Gentile, with his different ways and customs. Those teaching in foreign schools, or schools not complying with the conditions laid down by this committee, are ordered to withdraw from their positions. The 'malignant leprosy' is the contamination by the outside world which results from education with the Gentiles. It is admitted in this article, in answer to protests, that the opportunities in some of the non-Jewish schools are better than in the Jewish schools—for example, in the teaching of foreign languages, so important for conducting business or securing employment; that there is greater diligence in instructing; and better hours and better care of pupils. Nevertheless, parents are informed that they must sacrifice for the sake of their race those chances for their children, doing their best meanwhile to raise their own schools to the higher level. Those who are failing to live up to these ideals are designated as 'traitors' and by other opprobrious names, and the article ends with this threat of persecution to any who do not obey the orders of the Zionist Committee thus conveyed:

> "'Let him know at least that it is forbidden him to be called by the name of Jew and there is to him no portion or inheritance with his

brethen, and if after a time they will not try to reform, let them know that we will fight against them by all lawful means at our disposal. Upon a monument of shame we will put their names for a reproach and blaming forever, and unto the last generation shall their deeds be written. If they are supported, their support will cease, and if they are merchants, with a finger men will shoot at them, and if they are Rabbis, they will be moved far from their office, and with the ban shall they be persecuted, and all the people of the world shall know that there is no mercy in judgment.'

"This was followed about a month later by a second article, also in Hebrew, entitled 'Fight and Win,' which announced that the threatened persecution would now be carried out:

"'The names of the traitorous parents and of the boys and girls who have not taken notice of the warnings ought to be published at once and without delay, in the papers and on public notices, placarded at the entrance of every street. The list of these names should be sent to the heads of every institution and to the rulers of the synagogues, to hospitals, to those who arrange and solemnize marriages, and to the directors of the American Jewish Relief Fund, and so on. It should be the title of "Black List" and "Traitors to Their People." An order should go forth to all, and if one of these men has a son, he shall not be circumcised; in case of death the body is not to be buried among Israelites; religious marriages will not be sanctioned; Jewish doctors will not visit their sick; relief will not be given to them when they are in need, if they are on the list of the American relief fund—in short, we must hunt them down until they are annihilated. Men will cry to them: "Out of the way, unclean, unclean!" Because these people will be considered as malicious renegades, there can be no connecting link between them and us. Again, the society of young men and girls of Jerusalem must accept it as a principle to expel from their societies all those who visit these schools; to point the finger of scorn at them; and to make them see that they are put out of the camp. These traitor scholars, boys and girls, must understand themselves that they are sinners and transgressors, who are isolated, driven from all society, separated from the Jewish community, after they have once despised Israel and its holiness, and it will be interdicted to all sons of Israel to come near them . . . . War against the traitors among our people. War by all means legal. War without pity or mercy; that the traitors may know that they must not trifle with the sentiment of a people. Fight and win.'

A Sample of "Jewish American" Hate

"THE Zionist Committee, *of whom one was an American,* followed this by a printed announcement that the time of grace had passed and that forthwith the names of those who were still refractory would be posted publicly on street-corners, and the boycott begin. Miss Landau, a devout Jewess, the head of the best and highest Jewish school for girls in the city, the Eva Rothschild School, one of those, however, whose pupils and teachers were threatened under these rulings because they would not follow the dictates of the Zionist Committee, appealed to the civil authorities. The committee was haled into court and the threatened boycott enjoined.

"With such an attitude on the part of Zionist leaders in Jerusalem it might be expected that violence would ensue. Easter is a time of great excitement and unrest in Jerusalem for Christians, Jews and Moslems alike, for with Easter coincide the Jewish Passover and the Moslem pilgrim feast of Nebi Musa, when Moslems gather from all over Palestine to hear sermons in the Haram Esh-Sherif, and then march to the so-called tomb of Moses near the Dead Sea. The religious excitement of that season which vents itself in curses of each against the others, is always likely to produce physical outbursts if the cursers come into contact with one another. The Turks wisely segregated at that time each religion in its own quarter. This, in spite of warnings and requests from the Moslem religious leaders, the English failed to do, either through ultra-confidence in the *pax anglicana,* or because of objections from Jewish representatives against such segregation as applied to them. For days beforehand hot-heads among the Jews and Moslems were inciting to riot, and in their quarter Jewish trained bands were preparing for the conflict, a preparation of which Moslems from long wont probably had no need. On Easter morning, 1920, the fanatical Moslems of Hebron arrived at the Jaffa gate with their sacred banner, singing their songs of religious intolerance. There numerous Jews were waiting to greet them. The English Tommies with their officers were all in church. Whose insults were the worst and who struck the first blow is not clear. Battle was speedily joined. *The Jews were better armed,* with guns against the Moslem knives; but the Moslems were the better fighters. The city within the walls was speedily in their hands. The Jews living there were the old-time Sephardic families, dwelling close-packed in miserable slums, with no sympathy with Zionism, peaceful and quite unprepared. Moslem fury vented itself on these poor wretches. Without the walls the Jews were in the vast majority. All told, by official count there were at that time 28,000 Jews, 16,000 Christians and 14,500 Moslems in Jerusalem. What the Moslem did within the walls the Jew endeavored to do without the walls. Before my eyes an Arab camp just below the great Jewish quarter was set upon, burned and plundered, the poor inhabitants fleeing for their lives while guns popped from the Jewish quarter. Two men were killed there. When the troops reached the scene the great bulk of rioters whom they rounded up were Jews. The subsequent court proceedings also seemed to place the chief responsibility for the outbreak on them. The major sentences were equally divided between Jews and Moslems, but of *the criminals who received lighter sentences the majority were Jews.* For a week we lived in a state of siege, not allowed to pass in or out of the city gates, or to show ourselves on roof or balcony after sundown, and for months there were guards at every turn, assemblies were prohibited and there was continual danger of a new outbreak.

THE NEW WITNESS, of which the famous Gilbert K. Chesterton is the editor, published this as a part of an editorial utterance:

"We have never professed to utter prophecies, but only principles. But again and again those principles have turned out to be prophecies. We do not pretend to describe the events that will happen, but only the facts that exist . . . .We said that certain elements existed under the surface; we did not know exactly when or where they would come to the surface. But at least when they did come to the surface, we were not surprised. A good many other people, however, were very much surprised, not to say bewildered; and that bewilderment is the whole of the present politics and philosophy.

"For instance, we never predicted that a particular sect of Jews would ride the Russian Revolution, would halve the power of the Allies and double the length of the war, would create an armed internationalism menacing the nations, and pit the ideas of the landless against traditions of the land. Nor did anybody else predict it; though many predicted almost everything else except the thing that happened. But we did say that the Jews were dangerous, when everybody else was saying they were innocuous and almost non-existent. We did say they were dangerous through their indifference to the agricultural civilization and the national idea; while all society was engaged in setting them up as squires to rule the countryside and as statesmen to rule the country.

"We were quite certain that something would happen, if men went on denying the Jewish problem, something to convince them that there really is such a problem. It has happened; and they are convinced. A change in the whole tone and terminology even of the Press proves that they are convinced. In whatever other way we may succeed or fail, we shall certainly not now be the only people to distrust or denounce the Jews. We are far more likely to be the only people left to defend them."

Machine-Guns Needed by Sir Herbert

"THE appointment of Sir Herbert Samuel, a Jew, as governor of the new protectorate under the Zionist Mandate, greatly increased the excitement. In Moslem towns like Nablus it was openly said in my presence that no Jew might enter the place and live. The Christians, who had taken no part in the riots, were nevertheless to a man in sympathy with the Moslems, and one saw the curious spectacle of Cross and Crescent making common cause. It was prophesied that should Sir Herbert come as governor he would never enter Jerusalem alive. In point of fact, he landed at Jaffa and came up to Jerusalem under strong guard, *with machine-guns before and behind,* and the following week made a visit to Nablus and Haifa in the same manner. That was the situation when I left Palestine. Sir Herbert had at that time just issued his declaration and his interpretation of the mandate. *English officers and officials almost to a man were against the Zionist Mandate,* and their utterances in many cases were extraordinarily frank. Some of the most prominent and best-trained sought transfers to other posts because of their feelings on the matter, and some resigned.

"It has since that time been extremely difficult to obtain reliable information of prevailing conditions. It would seem, however, from all the information I have been able to gather, that Sir Herbert, who is, I believe, not himself a Zionist, has acted with singular tact and discretion. He has shown great fairness and indicated his intention to govern with impartiality, granting no special favors to any, nor allowing outside committees or local organizations to dictate or assume to dictate unfair policies. When I left Palestine, Jews were leaving in considerable numbers, especially those claiming American citizenship, so that the outgo was larger than the income. Since then, if I may judge by reports, Jews have been coming in, chiefly from eastern European countries, some parasitic and objectionable, others of a higher type. Some of the latter, graduates of universities, both men and women, may be seen engaged in hard manual labor, I am told, building roads and the like, not despising to do such work in order to secure their Palestinian home and fulfill their aspirations.

Danger Lurks in Zion

"IT IS too soon to judge the future of the Zionist experiment in Palestine. If the English authorities will give fair play to all, and if the Jews will pursue the old policy of the Alliance Israelite and its schools of seeking to benefit all dwellers of the land alike, to break down, not to build up, religious, racial and social prejudices, then the Jew may perhaps overcome the present prejudice against him, and his invasion of Palestine may prove to be a blessing both to himself and to the land. The methods of those in control of the Zionist movement in Palestine while I was there were, however, aimed in the opposite direction and tended to make the Jew an object of hatred and violence wherever the opportunity for violence offered. This has been illustrated again by the recent bloody riot in Jaffa which compelled the expedition of a British warship to that port; and the order issued holding up all immigration shows that not Jaffa only but the whole country is unsafe. *The Jews in Palestine are now protected only by force of British arms. Were the British troops withdrawn, the Jews would be exterminated by the angry natives, of whom the Moslems alone outnumber them in the ratio of more than ten to one; and with such action the neighboring countries would sympathize, yielding ready assistance if any were required. Mesopotamia and Egypt are seething with disaffection against British rule, and racial-religious ferment, and Palestine is to them and to the Arabs of Arabia a holy land included in the heritage of Islam. Moslem India also feels this keenly, and the British have been obliged to withdraw Moslem Indian troops from Palestine, because they will not fight fellow-Moslems.*

Jewish Problem Not Religious Antipathy

"IN THIS country the Jewish problem which we have hitherto had to face is not a result of religious antipathy. Religiously, politically and economically, the Jew has the same opportunity as everyone else. The Jewish problem here has been merely a matter of social prejudice, resulting from the extremely difficult task of amalgamating with great rapidity an enormous population, alien in race, culture, custom and habit. In 1880 there were, according to Jewish statistics, 250,000 Jews in this country. The Jews now claim 3,500,000, for the most part an undistributed mass huddled together in a few of the great cities—one-third of them in New York. Coming in such great numbers in so short a time and herding together thus, intentionally or unintentionally they help one another to resist the process of Americanization. This enormously increases the incidence of social prejudice. Those who have no conscious prejudice either of religion or of race are in danger of imbibing or developing such prejudice as a method of protection of their institutions, their traditions and their habits. The Zionist movement, with its intentional development of race consciousness and race peculiarity on the part of the Jew, is an additional obstacle against the efforts of those Jews and those Christians who are seeking to break down prejudice and to bring Jew and Christian together within a common recognition of the Golden Rule: that each should treat the other as he in like instance would wish to be treated by him. One of the greatest of English Jews, honored and respected by Jew and Christian alike for his learning, his philanthropy and his godly piety, says of this racial-political Zionism that it has broken his heart, and set the clock backward for his people a hundred years. The Christian lover of his country and his fellow-men may well express a similar feeling on his side."

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents for each volume.

Remaking the School Children of a Big City

By FRANK M. CHASE

"RESTORING tone to under-nourished muscles is the first essential to their training," the physical director held. "Feeding the brain cells," said the supervisor of hygiene, "is an educational matter." On the basis of these views a city's children have been remade.

Early in 1919, Dr. Fred Burger, director of physical education in the Kansas City schools, felt that his department should do some additional health work. This led to the employment of a supervisor of hygiene, whose task was to see what could be done for the health of the children in a school system having neither physicians, nurses nor dentists. Tackling the job earnestly and thoughtfully, the supervisor's first step was to determine existing conditions. To this end she conducted a rapid weight-height survey of 55 grade schools. Federal agencies at that time were calling attention to the alarming percentages of malnourished school children, the estimates ranging from 20 to 30 per cent, and it was assumed that the schools of Kansas City were not exceptional in this respect. The results of the survey indeed not only justified this assumption, but revealed a serious health emergency. At least an average percentage of the children were below standard, while in the school where malnutrition had its greatest hold, 41 per cent of the pupils were 10 per cent or more underweight.

To determine what remedial measures should be taken, a complete health service was provided the under-weight children of this school. This was in charge of the supervisor of hygiene, and consisted of medical, nurse and dental service; correction of defects; and mid-session meals on the "protective feeding" plan, the main feature of which is the serving of milk.

Owing to the objection of parents, not all the children in the school could be included in the test. This divided the underweight pupils into two almost equal groups, there being 112 who received the school feeding, and 109, identical in physical condition, who were regarded as the control group.

The test continued nearly 10 weeks. At the end of the period, despite adverse conditions and handicaps unremoved, it was found that the demonstration group had made a gain of 231 per cent, or 40 ounces each, the normal gain (100 per cent) for the group being 18 ounces each. The control group, on the other hand, which received none of the health service, lost four ounces, or 24 per cent, each. The total gain of the demonstration group over the control group, therefore, was 255 per cent. As striking, perhaps, is the fact that this school, which ranked the lowest, or fifty-fifth, in the spring weighing ranked third in September, the difference undoubtedly being attributable to the intensive health service.

The teaching of formal physiology in Kansas City schools has been largely displaced by instruction in the simple things that go to make health. This class is absorbing such information from a special exhibit which the hygiene division of the physical education department sends from school to school.

Miss Maud A. Brown, supervisor of hygiene in the public schools of Kansas City, Mo., knows how to arouse the pupils' interest. These youngsters are getting some essential lessons in foods from her that are certain to go home with them.

Manifestly so complete a health program, which was supplied only through the excellent co-operation of the local anti-tuberculosis society, could not be obtained at once for all the under-weight pupils of the city. Out of her knowledge of local conditions and from the results of the test, however, the supervisor of hygiene recommended the employment of an adequate number of school nurses and the feeding of milk in school, at least for the under-weight pupils. A departure so radical as providing milk for the children in school met, of course, with objections; the schoolroom, it was said, is a place for mental, not physical, feasting. But the supervisor stood her ground, insisting that the proper nourishment of the brain is of pedagogical importance, and was backed by the physical director's opinion heretofore indicated. Several of the principals, too, were convinced by the results of the test and began at once to serve milk in their schools on their own initiative, many more of them doing so in the autumn.

Coincident with the adoption of milk feeding was the addition of scales to the school equipment. "A department of physical education without weights and measures is as absurd as would be an apothecary shop, and the results similar," declared the supervisor of hygiene. All the 87 grade schools in the city were equipped with scales by September, the use of which indicated that in that month more than 30 per cent of the pupils in the schools of Kansas City were seriously (10 per cent or more) below standard weight. The scales, too, were soon giving ample proof of the effects of the milk feeding. Wherever it had been instituted the undersized bodies immediately began to regain their normal flesh, while the teachers noticed the improved lessons and attention.

These early results, illustrating concretely the effectiveness of the milk feeding, gave a decided impetus to the entire school health program. New plans were laid, and the force of nurses increased as rapidly as possible. "Wipe out malnutrition" became the slogan of the department of physical education, and the second half of the year opened with all forces organized for an aggressive campaign to reduce the number of under-weight children.

In the work that has followed Kansas City's good fortune in the choice of Maud A. Brown as supervisor of hygiene has been shown many times. After graduating from the University of Iowa, where she specialized in biology, she spent a number of years in teaching. For seven years immediately before going to Kansas City, she taught in the public schools of Los Angeles. During half this time she was head of the biology department in one of the high schools, where she became especially interested in the problem of hygiene for high school girls. She also was assistant supervisor of the science teaching in the grade schools of that city several years. With this thorough training and experience in teaching is coupled a sincere love of children and unusual ability as an instructor. Thus she has brought to her position an admirable fitness for directing the health work of a city's schools, as the results that she has obtained further indicate.

Among the means of attack on the malnutrition problem has been the weighing and measuring of every child three times a year by the teachers of physical education or other members of the department, these examinations taking place in September, January and June. In September, 1919, it will be remembered, approximately 30 per cent of the pupils were seriously under weight. But by January, 1921, or only 16 months later, the percentage of under-nourished children was halved, being but 15 per cent. And this despite the fact that during the summer vacation, the school health program being relaxed, two-thirds of the pupils who had been restored to normal from the 10-per-cent-underweight class, slipped back into their old under-nourished condition.

The weighing for June, 1921, has not been tabulated. A cursory examination indicates that a slight rise in the number of under-weight children is to be expected, as occurred between January and June, 1920. This is due partly to lighter underwear, but mostly to preventable causes. One of these, which the department now believes has been removed, is the city field meet held each spring. Heretofore this has been a temptation to thousands of children to "train down" to a point far below that for the best interests of their health. Since the last track meet, however, the physical education department has established a weight standard for participants, barring the children who are under-weight from competing in the contests.

The large increase in the staff of school nurses has doubtless contributed to the improvement in the health of the pupils. When the health work began in 1919, there were no nurses in the Kansas City schools. Last year, 1919-1920, there was one to every 5,000 children. Since, the number has grown, until in the school year recently closed a nurse was employed for every 1,400 pupils, Kansas City now ranking among the foremost cities of the United States in this respect.

The nurses' service, however, represents the defensive side of the war on malnutrition. The aggressive factor in the fight is the milk feeding, which has been established in all but five or six grade schools of the city. Then, coupling the health work of the school with the home, the backbone of the entire plan, is the periodic weighing and the report to the parents.

At first all the grade children of the schools serving milk received the mid-session lunches. The principals also arranged the details of the work for each school, and attended to financing the supplies. Later a uniform plan went into effect, whereby the domestic science department took charge of the milk feeding, the department of physical education recommending the children to receive the extra nourishment. Under this arrangement, which has been in effect the past year, the milk is prescribed for only those children who are 10 per cent or more under weight and those in the primary grade and kindergartens, though other pupils may have it if they so desire and their parents assent.

When feeding-time comes each child who doesn't weigh what he should for his age and height gets a half-pint bottle of cold milk, a straw and a graham cracker or two, and proceeds to enjoy his lunch. The usual time for serving the milk is just before recess. In a number of the schools the pupils receive the milk twice daily, or before each recess, but the general plan is to provide only the mid-morning ration. The milk, straw and crackers cost the child five cents. In nearly every case the parents pay this charge, but where they cannot the under-nourished boy or girl gets the milk just the same.

Edge to the pupils' interest in good health is obtained by classifying them according to their physical condition. After each of the thrice-a-year weighings they are divided as follows: Those 10 per cent or more under weight; those under weight, but less than 10 per cent; and those normal or above the normal weight for children of their heights and years. Every child's name, with his age, height, normal weight and actual weight, is then placed on a wall chart within easy reach of his eye and pencil. At the bottom of the chart are tables for determining normal weight and normal rate of growth, so that every one may tell whether the milk drinkers are making progress or the others are slipping back.

In addition each child receives a card, on one side of which are recorded his weight, height and normal weight. On the reverse side are a number of health rules. The children who are 10 per cent or more underweight get red cards; those less than 10 per cent under-weight, yet below normal, get blue cards, while those having the correct quota of flesh or more receive white cards. To the pupils these cards represent tangible evidence of a proper or inferior condition, with the result that they strive constantly to possess the white cards and get rid of the red and blue ones.

An especially close check is kept on the weight of the pupils receiving milk. Besides the regular weighings in January, June and September, they are weighed monthly by the classroom teacher.

In this connection, consider the forces centered on the malnutrition problem of Kansas City—teacher, nurse, mother and extra nourishment at school. This is an ideal combination. How it works may be illustrated by what happens when Johnny takes the little card bearing the information relative to his weight home to his parents. It is largely a story of what "teacher says."

"Teacher says," he tells his mother, "that if I am as much as 10 per cent below standard it means I am breaking some of the health rules on the back of the card, and that if you will help me to keep them this month, probably I will weigh more next time."

Month after month the card comes back, and with it what "teacher says" every time: "Teacher says I mustn't go to the movies at night"; "teacher says to eat more spinach"; "teacher says to sleep with the windows open." And what "teacher says" has its effect, of course. The recorded gains of the malnourished children show that.

Will Main Street Grasp Its Main Chance?

By EDWARD J. BECK

A JUNIOR executive of a chain-store company in Cincinnati was compelled by ill health and the after effects of an operation to give up his position for an indefinite period.

When the doctor advised him to take a good long rest in a place where he could have the advantages of perfect quiet, fresh air and good food, he notified his folks in an Indiana village that he was coming home. He knew of no place that better met the requirements of his physician than the place where his father, a retired farmer, lived and where his uncle had a general store. He himself had grown up on a near-by farm.

His previous visits had all been casual ones. Now circumstances compelled him to be an actual resident of the town until the recuperative forces of nature could work their slow results. His mind could not remain long inactive. He soon began to occupy his imagination with speculations as to what he would do if he were in a position of leadership in the community.

As he lay back in his reclining chair he wondered just what would happen if the six leading stores in town sold out overnight to a half-dozen keen young men schooled in the latest methods of city merchandising. His uncle and the rest of the local merchants were literally storekeepers instead of business-getters. The inroads of the mail order houses and city stores were beginning to cast some doubt on even the "keeper" part of their designation.

Farmers Were Buying in the City

THE methods of doing business had not changed much in the 10 years since he had gone away, though other revolutionary changes were apparent. The roads had been greatly improved; practically every farmer had an automobile. Evidences of prosperity and higher standards of living and comfort were noticeable throughout the countryside. But the better highways had been a business detriment to the village because the farmers now made many of their large purchases in the county seat and the city 65 miles away.

After the young man had inventoried the causes of business stagnation and decline, he presented his conclusions and deductions to an informal meeting of the local merchants. A commercial club was organized. Co-operative bargain days were instituted to draw trade from beyond the normal trade zone. Several merchants who handled the same line were induced to pool their orders of certain staple, bulk goods and bought in carload lots at a considerable saving. The idea of specialization was emphasized and pretty soon the druggist gave up handling cutlery, the dry goods store quit handling phonographs, a general store stopped selling patent medicines. Considerable capital was thus released and duplication avoided.

These and other co-operative measures resulted not only in mutual good-feeling but also in increasing profits. The young man became so interested in the carrying out of the new ideas that he accepted his uncle's offer of a partnership. He saw the business possibilities of the village located in a prosperous farming territory.

Walk through the streets of any of our large cities today and you will see hundreds of *Room for Rent* signs where a year and a half ago lodgings were scarce. The young people who were attracted to the city by the hectic prosperity that followed in the wake of the war have in thousands of instances gone back to the old home town or the farm.

Advantages in the Old Home Town

THEY were never in so favorable a mood to consider the village as a permanent place of activity as they are now. The leaders in the life of the smaller communities who not so long ago were deploring the departure of their most talented sons and daughters to the fields of larger reward in the city now have a unique opportunity. They have a rare chance to impress the somewhat disillusioned young people with the advantages of life and labor in the old home town.

These young people are far more valuable assets now than they were before leaving home. They have participated in city life, industry and business and increased their contacts with the world. They return home with new acquisitions of both knowledge and skill and are more than ever qualified to make a worthwhile contribution to their community. What sorts of inducements must be offered to get them to locate permanently where they have now temporarily found a refuge?

The village to retain its energetic youth must offer two sorts of advantages. It must impress them as a livable place and it must have commercial possibilities.

It must offer a satisfying human existence and scope for the realization of the natural human desires for recreation, good fellowship, agreeable relationships and pleasurable activities. The business opportunities must be discernible and inviting enough to counterbalance the vocational attractions of the city.

The resourceful young man can find no more remunerative field for his enterprise today than the small town. He cannot build up a colossal industry there but he can find more opportunities per capita than in the city. Hundreds of small-town businesses, many of them located in mere hamlets, are doing a gross business of $50,000 a year without using Napoleonic sales tactics.

The overhead cost of doing business is often under 20 per cent and the net profit gives the proprietor a far more comfortable living than he could obtain in the city with a much larger income. One store in Ohio situated in a small hamlet does a business of a half million a year and another in Indiana has annual receipts of three hundred thousand.

These records are not the result of a set of unusually favorable circumstances but are the reward of large-visioned business generalship which would win equal returns if applied in any one of a thousand other places.

The only way the village will ever be able to realize its possibilities is by concerted action and organization.

A New England village was located in a natural setting of unusual beauty. But its run-down and shabby appearance presented a drab contrast to its attractive surroundings. Many of the hills about the town were thickly wooded but some of the streets of the town were bare of shade trees. The town hall was in a state of disrepair and other structures in the center of town were an eyesore.

A young physician returned to town after an absence of some years to take up his father's practice. He started to agitate for village improvement. After some weeks of propaganda work, he enlisted the support of the leading citizens. A meeting of the whole community was called to organize an improvement association. The meeting was so well advertised that everybody attended. Not only men and women but even the children were admitted to membership. The dues could be paid either in money or an equivalent amount of labor.

Town's Appearance Transformed

THE first project to which the new body gave its attention was a clean-up week. Then tree planting was encouraged by the offer of prizes for the best ten trees set out during the year. A leading citizen offered a prize of $50 to the householder who could show the greatest amount of improvement in his premises in the course of the year. This competition was the beginning of activities that completely transformed the appearance of the town.

A rest room was established for farmers' wives. A swimming pool was made by damming up a brook at a narrow place and the man who owned the property deeded it to the association together with three acres of adjoining land. This was made a park and picnic ground.

Several ball teams were organized. The married men crossed bats with the single men and the boys from the north side of Main street were pitted against the boys from the south side. A community picnic was made the crowning event of the year. In two and a half years, a commonplace village was charged with an amazing amount of life. Through organization, every person in the community—old and young, rich and poor, was mobilized in constructive effort for the common good and enjoyed the benefits of collective and purposive effort.

An old Scotch divine once preached a sermon with the suggestive title, "The Expulsive Power of a New Affection." The new community spirit will displace narrowness, pettiness and gossip by directing the energies of the people into constructive channels. The gossip and small-mindedness that infest a community cannot be criticized, legislated or ridiculed out of existence. When everyone is enlisted in boosting and bettering the community, the new activities drive out the old rivalries and replace sterile mental interests with vital aims.

Organization is the only method whereby the village can make itself a place where life is fully enjoyed and the potential prosperity may be realized. Organization may take the form of a commercial club, a broad-aimed women's club, an improvement society or a civic association. Any sort of organization marks a significant step in advance. The writer has studied the history of many of these bodies and has been particularly struck by the fact that even where the first aims were restricted, the organization soon found itself compelled to enlarge the scope of its activities, provided it survived beyond the infantile stage.

The commercial club may be organized for the purpose of securing better service from the railroad. Pretty soon the consciousness of collective power and an awareness of other needs will cause it to branch out into other activities.

A commercial club out in an Iowa town was formed to induce a pearl button factory to locate there. It failed in this aim. But it went off on a tangent and erected a band stand for Saturday evening concerts that attracted the farmers for miles around. Occasionally free open air movies were displayed. The grounds around the railroad station were beautified through its efforts. A Chautauqua was brought to town. A community field day which was arranged provided more fun and produced more good will than the town had ever known.

"Finally and happily we are moving from *me* to *us*," is the way the present social trend has been expressed. The individualism of the past must give way to a group consciousness. The village must be conceived not merely as a collection of houses, a dot on the map, a place where the fast mail drops a pouch but as a *community*. Civic fatalism and inertia must be supplanted by an aggressive attitude.

Nothing Left to Chance

IN BUSINESS, industry and home life we leave nothing to chance. We decide what we want and go after it. The welfare of the town cannot be left to chance or to the benevolent intentions of isolated citizens. We must consciously and deliberately determine what the community lacks and needs and then organize to secure those ends.

First, there must be a vision of the possibilities. Before James J. Hill began his vast railroad building projects, he visioned the possibilities of the great Northwest. The vision of the transformed village may come either from a familiarity with what other communities have done or from the use of the constructive imagination of what can be done.

Then there must be an arousing of the spirit of service, a desire to find a larger self-realization in the common good. A new patriotism diverted out of the mere flag-cheering channel must be expressed in localized and more practical manifestations.

Finally there must be a program. It may start limited in scope or it may be ambitious and comprehensive. Certain definite and tangible aims must be set up as the object of endeavor.

A successful community organization should start off with lots of steam. Enthusiasm may be artificially aroused, as witness any college rally before a football game or the recent war drives. Care must be taken in choosing the projects which are first to be worked for. They must meet two requirements; they must be worthwhile and they must be attainable with reasonable effort.

Start with something simple like a clean-up campaign. It is a big enough project to get excited over and it is practical enough to secure everyone's co-operation. One successful community organization began with a local-talent minstrel show which demontrated how much fun there was in working together. Then plays were produced, a community house was built and after a while the co-operative activities were expanded to cover all phases of village welfare.

For the Good of All

THE ideal improvement association works for all phases of community betterment not only for civic beauty or business expansion. These aims are good to start with because they are tangible but when the organization has sampled the fruits of co-operative effort, it should use the same methods to promote other projects which intensify village life.

Other activities which have been successfully promoted are athletics, dramatics, libraries, lecture courses, playgrounds, summer and winter sports, community celebrations, community club houses, musical organizations, local fairs, and many other means of adding to the pleasures of life and making COMPLETE living in the village possible.

The young people will be content to live and work in a live town where there are opportunities for engaging in the activities and pleasures which youth demands. It is simply a matter of leadership and organization to supply the things now lacking. The experience of scores of villages offers convincing proof that deadness and commonplaceness can be supplanted by a rich and satisfying community life through well-directed collective action.

Gaunt Hunger Stalks in Once Proud Austria

Depreciated Money Makes It Impossible for Natives to Buy Food; Starvation Killing Many, Including Notables, While Foreigners Feast

By R. RUTHERFORD

CUTTING off Austria's sources of supply has left her dependent on the outer world for nearly all that her people require to eat and wear. As she produces little, she has little or nothing to sell. As she has nothing to sell her valuta (exchange rate of her currency) has sunk so low that her money has little value and it is impossible for her people therewith to pay the prices demanded by the producing lands. The result is the terrible famine now raging there.

Austria's budgetary estimates for the last half of this year show a total expenditure of more than 49,000,000,000 kronen (crowns), and receipts of more than 24,000,000,000; the deficit to be covered by credit operations amounting to 24,500,000,000 kronen. Compared with the last budget, the expenditure has risen by 40 per cent and receipts from monopolies by 63 per cent. The total indebtedness of Austria now amounts to 170,000,000,000 kronen, and the end is not yet in sight. Meanwhile the government, through subsidies, must supply the population of Vienna and other big towns with flour bought from abroad at ruinous prices. In despair it has been compelled to resort to the offer of the Austrian monopolies to the highest bidder. Sir William Goode, president of the Austrian Section of the Reparation Commission, now dissolved, says in the Vienna *Neue Freie Presse*:

"There are dark times ahead and the public should know it. They must be faced with courageous resolution, and emergency measures are necessary both on the part of the government and the public."

External credits cannot be granted by the League of Nations, he explains—they have no money—nor by the Reparations Commission, which also has no money; neither can they be obtained solely by Austria's initiative—she has no assets to pledge except by permission of the Reparations Commission. Only by a combination of all these factors can the result be achieved.

Human Wrecks Walk Streets

ALL Austria's misery is centered in Vienna. "Coal, firewood, meat, flour, nearly every commodity of food and clothes are lacking," writes an English Vienna correspondent, "and columns of half-starved human wrecks walk through the principal streets and pass and repass in front of the government and other principal buildings. An American investigator says: 'The situation can scarcely be realized by the outer world. There are groups of pitifully ill-clad people with eyes so hungry that any well-fed investigator feels ashamed under their accusing glances.' The agitation for food and clothes is reaching such a point that the government can no longer control it. The populace is quieted by promises of great things from the League of Nations finance committee. The starving multitude is told to wait but a little longer, when salvation will surely come, and the poor submissive Viennese public resigns itself for a time only soon to burst forth again in renewed clamors. The League of Nations finance committee meets, but it can only make recommendations for help, all of which are very problematical.

The coal famine is almost as serious as the food famine, and is due entirely to the action of the Peace Treaty in transferring Austria's coal mines to Czecho-Slovakia, which now refuses to sell coal to Austria.

Most of the distress in Austria is due directly to the depreciation of her monetary standard. In six months the depreciation of the kronen (crown) has amounted to an additional government debt of 4,000,000,000. Of course, no nation, no people, can continue at this rate and buy necessities from abroad. The situation is most abnormal. Salaries and wages have been raised from five to 60 times, and still the increase is insufficient, because the price of commodities, especially those derived from abroad, have been raised 20 to 235 times their former value. An unskilled laborer receives from 500 to 800 kronen a week. A skilled laborer receives from 1,000 to 1,500 kronen, and a professional man 900 kronen. Judging by the former standard, this might seem like good remuneration until we consider the prices. A pair of shoes fit to wear costs 1,600 kronen; a suit of clothes 12,000 kronen. A tin of condensed milk costs 56 kronen. The cost of the necessities of life would be many times higher but for the government subsidies, which are helping to reduce the nation to ruinous poverty. The Reparations Commission has recommended that the state bread and flour subsidies must continue for the present, because they seem to be the only means of saving the entire populace from starvation. Uncontrolled flour now brings in Austria more than 300 times the pre-war price, and this is what the people would have to pay for it, but for the subsidies. The actual cost to the government of controlled flour is 200 times the pre-war costs, while official salaries, which are the support of 800,000 persons, have advanced only 18 to 20 times the pre-war rates.

If the people of Austria were to pay the present world-market prices for foods at the prevailing depreciated rate of their currency, a laborer's weekly salary would scarcely buy a day's rations for his family. Hence the state subsidies for the controlled or rationed foods. The state buys the foods at the world-market price; that is, the price charged by the producing lands in their own currency. She then sells them at enormous loss to the Austrian dealers for Austrian currency. The losses to the state resulting from the food subsidies amounted at the latest calculations to the staggering figure of 37,700,000,000 kronen (normally $7,540,000,000). While the flour subsidies will continue, the other subsidies, under the new League of Nations' plan, are to be abandoned or reduced, which means a still further rise in food prices, with attendant greater distress among the populace.

The kronen (crown) is the monetary standard of Austria, as the dollar is of America. Formerly it was worth 20 cents. Now the American exchanges his dollar in Austria for 500 kronen; the Englishman his pound for nearly 2,000 kronen, and there is similar disparagement in comparison with other foreign moneys. Thus, while to the foreigner, prices in Austria are remarkably low, to the Austrian, himself, they are fabulous. People of means have suddenly found their fortunes reduced to myth.

Many erstwhile wealthy men are now in direst want. Some have starved to death. I have already mentioned in my previous article the case of General Boroevic, commander-in-chief of the Austrian Armies, who killed himself to avoid starvation. The *Neue Freie Presse,* of Vienna, reports the death from starvation of Dr. Max Margules, the world-famous meteorologist. He was forced to live on a monthly pension of 429 kronen, less than one American dollar at the present exchange rate. Pride forbade his accepting the proffered assistance of friends. The report adds: "The tragic occurrence has caused consternation in Vienna, but there are many similar cases due to the depreciated monetary standard."

Hugh Hofmannthal, who wrote the libretti to the Richard Straus operas, on the other hand, has been begging for bread. The professional classes are the greatest sufferers from the destitution which the Versailles Peace Treaty has provoked.

When I was in Innsbruck a short time ago the newspapers there published an account of the death of Professor Jacob Mayer from starvation. Professor Mayer is not unknown in America, where he formerly taught languages in New York.

Most of the starvation sufferers among the professional classes refuse to permit publication of their names. The *Daily Express,* London, publishes the following from its Geneva correspondent:

"A statement made to me by an American Red Cross officer who has just arrived here from Vienna gives a lurid picture of the state of famine prevailing in Vienna. 'We have to protect little children against the rapacity of their parents,' he said. 'When we gave children food, the parents snatched it from their offspring. We therefore made the children eat the food on our premises. The result was that the children were ill-treated by their parents, who are also starving, and therefore cannot be greatly blamed.'"

The casual visitor to Vienna—he who spends his time in the hotels and restaurants—sees few signs of the hunger wolf that is gnawing the once proud city to death. The shops are well filled with foods and good clothing. But foreigners are their chief purchasers. The hotel tables are set with substantial dishes and many delicacies. The restaurants and cafés are crowded with elegantly dressed women and men who spend the night in wine-drinking, feasting and laughter. But this is not Vienna. This is the "schieber" and the foreign element that has flocked to Vienna to fatten on the city's distress, to take advantage of the low exchange rate which enables them to live in luxury at less than the cost of the bare necessities at home, to buy the heirlooms of nobility and royalty who are compelled to sell them to get something to eat.

Foreigners Live High

THERE would be more food for the Austrians and at lower prices but for this great influx of foreigners. They include speculators, investors, buyers of odds and ends of every description; men who amass fortunes by buying and selling currency in anticipation of a rising or falling exchange; sharks, sharpers and "schiebers" of every breed. Vienna is teeming full of them. The result is there is a terrible house famine, as well as a coal famine and food famine. It is almost impossible to get a room even in the Vienna hotels.

The hotels and restaurants of Vienna have gone quite out of the lives of the Viennese whose affable manners were once their chief attractions. The costs are now prohibitive to all but the very rich and the foreigners. They have advanced not 50 per cent, as in some favored countries, but 50 times. Thus a meal for which the rich Viennese in pre-war days paid ten kronen in the restaurants around the opera, now costs a minimum of 500 kronen. Hence not even the wealthiest Viennese can today afford to go often to these restaurants. But the foreigner laughs at these prices. To him they are extraordinarily cheap. An American, for instance, with $1 (500 kronen) can sit in the most fashionable Vienna restaurant and have a meal forbidden to its quondam millionaires.

The *Wiener Journal* aptly says that the post-bellum conditions have created a state of things in which the once rich Viennese has completely forgotten what it is to eat a good meal. The Vienna gourmet has lost even the memory of his former fine dishes, such as the *Kruspelspitz,* the *Broselfleisch,* the roasted *Beinfleisch,* and his favorite *Schnitzel.* Waiters no longer dread scandal from a *Stammgast* because a steak is slightly overdone or too underdone. Viennese guests no longer know what a good steak is like. The only ones who still get them are the privileged foreigners. These ask the restaurant proprietors to supply them with roast beef at 120 kronen a plate, *filet de turbot a l'americaine* at 200 kronen, steak and potatoes at 85 kronen, fish salad at 60 kronen (less than 10 cents), roast duck or goose at 1,800 kronen, and vegetables and soups, which to them cost the ridiculously small price of 10 or 20 kronen (two to four cents) a plate. The poor Viennese look at these wonderful viands and stare. They are entirely beyond the capacity of even their longest purse. And yet foreigners take out a dollar or two and pay with a smile as they say: "How cheap is living in Vienna compared with Paris, New York or London!" They order costly Austrian or Hungarian wines at 700 to 800 kronen a bottle, which simply staggers the natives, and when they order champagne at 1,800 to 2,000 kronen a bottle, the Viennese simply run away in amazement. Such a sum represents perhaps half a month's salary of a minister of state, or a month's salary of a university professor.

In the cheaper restaurants frequented by the Viennese the food is very inferior. While foreigners eat the finest white bread, the natives are forced to subsist on the rationed article, made from the standard flour, which is deep brown and of a musty flavor. White bread is considered a rare luxury. All over Vienna the foreigner may buy as many fancy cakes and pastries made from white flour as his purse can afford.

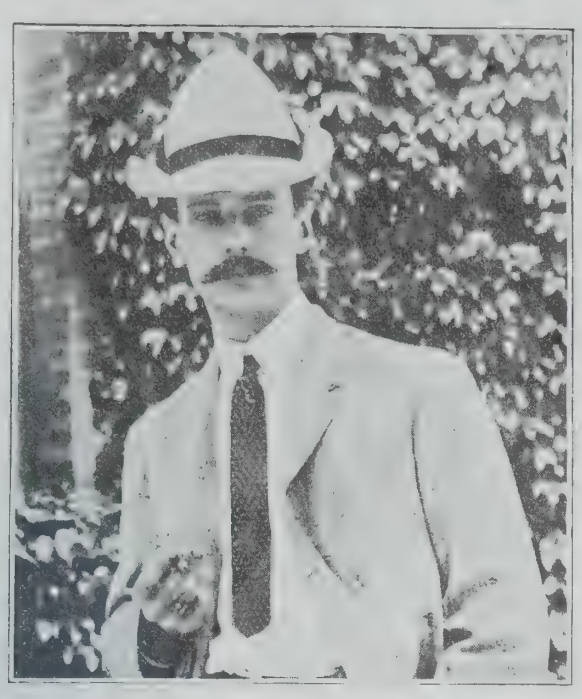
The native Viennese do not fail at times to sneer at the foreign invaders of their former epicurean haunts, and the Americans come in for their share of the derision. Alfred Polgar, a Viennese scribe, once an associate of the gourmets, takes a severe fall out of the Americans in an article entitled "The Conquerors," recently published under his name. It is given as an example of the manner in which some rich Americans conduct themselves in the Viennese restaurants. Here is an extract from "The Conquerors":

"The small special dining room of the hotel possesses a table that is unlike all others. A tiny flag, starred and striped, peeps out from between the flowers in the vase. A dish is piled high with slices of perfectly white, whitest of white, bread. The golden yellow of pure butter gleams from under a glass lid. Tins and pots, round and square, brightly labeled, surely conceal tasty foods. Bottles and dishes emit the smell of food—of spices and essences.

Stare at Noisy Americans

"THE natives at the tables round about contemplate the culinary still life with awe.

"Here the conquerors dine, the Americans. Hail to them! To their entrance into the war do we owe peace (albeit one of fourteen sore points) dollar parcels, democracy, soup-kitchens. We love America! Hence do the natives gaze with awe at the table of the mysterious dishes, pots, tins and sauces. Two conquerors in white summer garb enter the room. They are young, good looking, erect. They have no eyes for the natives. We of the wrinkles look with shy envy at these smooth faces, crossed by no folds of humiliation or deprivation.



"Then enters a youth in naval garb, apparently the head of the table. He sits down without greeting, seizes a prepared plate of white of egg and, with the soup spoon as a whip, begins lashing the egg. Why he does so, why he does so here, why he does so himself—who can penetrate a strange psyche? The American whips the egg for ten or twenty minutes. The spoon strikes loudly against the plate. The room reverberates with noise. And the natives pale and duck. It seems to them as though the drum of victory were rolling overhead.

"Do American gentlemen at home whip their white of egg themselves in a crowded hotel dining room, beating a spoon-and-plate tattoo? What entrancing music that must be! As nerve-soothing as the Sousa rhythms!

"The next American joining the table is followed by a dobermann (black breed of dog), whom he drags behind him—a fine, bold, dashing animal, still unlicked by servile European culture, himself licking everything in reach. The American carries a whip. Eye glares at wrathful untamed eye, and training begins. The dog foams, bays full-throatedly; the whip comes slashing down; the dog does not give in; the American does not give in; chairs crash; a screen overturns; waiters and natives bolt; the hotel manager, white as his tablecloths in peace-time, abjures the panic with the assurance that the dobermann scene is repeated day by day, that no serious mishap has so far occurred, and that in America people have the habit of breaking in their dogs in crowded dining halls. And why should the conquerors—present not for their 'out-for-out' sakes—forego in a vanquished city the customs, foods, habits of their homes? The dog howls horribly, the whip whistles in air, the youth in naval garb loudly whips his egg, the scowling American whips his dog, the booty is being initiated into the mysteries of 'Yankee Doodle' by her neighbor. They sup in comfort.

"No importance! Thousands of children are fed in Vienna by American charity. May the self-whipped white of egg agree with the man in naval garb! May the dobermann take the lessons in the dining room to heart! Training is necessary, dear fellow, for members of a good and strong race as well."

Many Americans abroad are obsessed with a desire to "show off." This is a sample of their doings and the opprobrium they are bringing on their country. None is more ashamed of them than the quieter and better element of Americans themselves.

RAYMOND L. DITMARS,

Who carried out a boyhood ambition and became a great naturalist. Besides being curator of reptiles and mammals at the New York Zoological Park, he is known the world over for his remarkable motion pictures of nature subjects.

A Boy Who Did What He Wanted To

By R. P. CRAWFORD

FROM the age of five or six years he had taken a strange delight in bringing home toads, which amused themselves by hopping over the various rooms in the house—that is, when this boy's mother wasn't looking. Then his interest shifted to snakes. This bad boy, no doubt as the neighbors considered him, got into the habit of going over to a swamp and soon had substituted snake hunting for toad hunting, and shortly there was quite a museum of snakes at his home. The first thing this boy's parents knew he was bringing home rattlesnakes. He had turned out all the harmless snakes, because they were so commonplace and uninteresting, and had substituted rattlers. And, of course, our story must say that the father of this young man had many talks with him as to the impracticability of such a course as he was pursuing.

And this boy—no, he did not become a street car conductor, or a carpenter, or a merchant, or end up in the poor house, or become a do-nothing—in fact, he became a distinguished naturalist, one of the best we have in this country.

Today wherever motion pictures are shown you will see the work of Raymond L. Ditmars, for it was this boy now grown to manhood, who put all sorts of queer bugs, insects and animals into the movies. He has prepared more than 500 film releases dealing with natural history subjects at his country home in Westchester County, near New York, all in addition to his work as curator of reptiles and mammals at the New York Zoological Park.

Isn't it refreshing to find a boy who really did what he wanted to and succeeded in doing it? Especially in a day like the present when every one imagines he is a misfit? Isn't it lucky that this boy did not turn out to be a mechanic, or doctor or lawyer?

What I have told of young Ditmars' early life is actually true. He did bring home toads; he did bring home snakes, and he did turn out the common snakes to make room for the rattlers. The latter happened one summer when he was about 14 years old and the family was at its summer home some distance from New York. Ditmars found a rocky cliff some two miles away, and climbing it discovered a rattlesnake on a ledge. He put a noose around its head and brought it home. Later it developed that there was a regular summer colony of rattlers around this ledge, and Ditmars was in his glory. Formerly he had to hunt for ordinary snakes around a swamp near the family's Brooklyn home, but now with his rattlers, he had a real subject with which to experiment.

But the next important point is the way this boy finally found out how to make use of all this knowledge and to find a place in the world where he could apply it.

Young Ditmars had asked his father to be permitted to give up his college course. He wanted to become an apprentice at the American Museum of Natural History. He had observed that those officials who had obtained positions of prominence there drove down to the museum with horse and carriage, and to every appearance were prosperous, respected men of affairs.

So he went into the museum and when he was 20 years old had become an assistant curator, a position of prominence for so young a man. Then he made the highly interesting discovery that so many scientists have made since—that scientists did not receive a great deal of money. The curators themselves were very well paid, but it probably would take eight or 12 years to become a curator, promotions in science, as in teaching, being made slowly.

Right here this young man nearly got sidetracked from his real purpose in life. "I had just spent a vacation in Washington, D. C., and had talked with a couple of the congressional stenographers," Mr. Ditmars told me. "I found that young men who were proficient received anywhere from $2,500 to $5,000 a year, exclusive of all compensation allowed for one's assistants. They advised me to take down in shorthand a number of Dickens' works. When I had learned to do that I would be able to take any congressional speech. My father read to me David Copperfield, The Tale of Two Cities, and Nicholas Nickleby, and I took them down in shorthand. I then applied for a reportorial position on the New York *Times* and obtained one in which shorthand came in handy. Besides 'covering' the criminal courts, I had evening assignments to report speeches.

"But one can find his right place in the world even if he is sidetracked now and then. About this time there were rumors of the establishment of the Bronx Zoological Park. The whole upper floor of our house had by that time become a collection of snakes and animals. Judge Goff, of the Court of General Sessions, where I was a newspaper reporter, advised me to try for something in the way of a curatorship. 'You can be a specialist in your chosen line, and then you can write, lecture, and do photography on the side,' he told me. Dr. W. T. Hornaday, who was to be the director of the park, had heard of my collection of snakes, and he was favorable to my appointment. That was 20 years ago and I have been out at the park ever since."

Of course, the most unique feature of Mr. Ditmars' career has been his development of the motion pictures of nature subjects. Out at his Westchester home he now has a complete motion picture laboratory, where he can photograph anything from a fly to a giraffe, and can produce countless photographs of flowers, and other difficult subjects. He has made reproductions of tropical scenes, swamp scenes and desert scenes so that he can give just the proper background to his nature pictures. Huge tanks are provided so that pictures representing conditions underneath the sea can be made. He has numerous motion picture cameras, and he does some of his work out in the field.

But his big achievement is not so much the 500 films that have been shown in theaters the world over, but a work which he is just now completing and which he plans to leave for posterity, just as other great naturalists and scientists have left great books behind them. But Mr. Ditmars' work will be a volume of motion pictures. It is a set of films which form a complete natural history. It begins with the apes and includes practically every animal and insect of importance. One hundred thousand feet of film have now been completed and filed away in vaults. Mr. Ditmars feels that a work such as this will greatly simplify the teaching of such subjects in schools.

"One must remember that often a rare animal may live only a few months," he said. "By photographing it we may preserve it for all time and for all people." Photography is an old subject with Mr. Ditmars and years before motion pictures came round he had taken many still photographs of animals and has altogether some 10,000 negatives.

Mr. Ditmars on a snake hunt. On this occasion he was summoned to a farm 125 miles from New York to clean out a colony of snakes. The farmer had only essayed to watch the thirty or thirty-five snakes which came out of the hole every spring through a spy glass. In this case the snakes were of a harmless variety and Mr. Ditmars persuaded the farmer to keep them, since they rid the barn of rats and mice.

One often wonders what it means to be a naturalist. Mr. Ditmars has still continued his study of snakes, begun in boyhood, and I presume there is not another man in America who knows more about their habits and has had more interesting experiences in his snake hunts. He has made repeated journeys to the swamps in our southeastern states and brought home large collections of deadly poisonous snakes. The other day he sat back in his chair and told something of how these reptiles are captured.

"I usually aim to make the trip to the southeastern states just about flood time, when the rivers are running high. My wife and two daughters go along. We usually camp or procure a house in some settlement near the scene of operations. The girls enjoy riding horseback, so we get some horses and proceed to make ourselves comfortable. We also have a horse and buggy and, of course, a boat.

"Under ordinary conditions it would be very dangerous to go poking around these swamps trying to catch poisonous snakes, but when the spring floods are on, the reptiles climb up on the sand hummocks or little islands. We make for one of these islands and there we can take our pick of all the snakes. There are the coachwhips, diamond rattlers, pigmie rattlers, water moccasins, canebrake rattlers, cottonmouths, coral snakes; in fact, just about every variety of poisonous and non-poisonous snakes that one would wish to see.

"We wear heavy boots and look where we step. As a general thing a snake cannot bite through heavy boots. In fact, in all my lifetime of experience with snakes, I never have been bitten, although I have been poisoned in handling them. When we find a snake we want, we slip a noose around its neck, and then put it in a box.

"More recently our two daughters, 15 and 17 years old, go out on these snake-hunting expeditions. It happened this way. We had left them behind at the cabin. They saw what seemed to be a rabbit in the bushes near the house and went out to investigate. Coming closer, they saw that instead of a rabbit it was the head of a rattlesnake, coiled and ready to spring. The girls decided they would not let me outdo them. They went in the house, got a cloth, and waved it in front of the rattler. That caused it to come out from under the bush, and coil up on the ground. Then one of the girls attracted the rattler's attention, while the other shoved a box over it. They filled a bag with sand and put that on top of the box. When I got home they had the rattler securely captured. However, after that, I decided that they might as well go with us, since I didn't want them capturing rattlesnakes on their own account. The snake which they caught was seven feet long."

On his next vacation Mr. Ditmars plans an expedition to the Painted Desert of the Southwest, where he plans to procure specimens of the pink and white rattlesnake.

It is not all fun, either, just running a zoological park. Mr. Ditmars returned a short time ago from San Francisco, bringing with him numerous animals and snakes, just received in a shipment from the Orient. Among them was an orang-outang. The orang-outang got the colic in San Francisco. Mr. Ditmars took it to his room in the hotel.

"Soon the manager appeared with the announcement that animals could not be permitted in rooms," said Mr. Ditmars. "They fixed up a place for it in the basement, but it was so cold and clammy there I knew it would never do. Just as soon as one porter disappeared I covered the box with paper, and summoned another porter to take 'the package' to my room. We got along all right until a few days later the manager again appeared, courteously sympathetic and saying, 'I see you have the monkey back again.'

"To settle the matter I had to quote Darwin and others to prove that an orang-outang is not exactly an animal, and might indeed be some distant relative of the hotel man himself. Consequently the rule against animals should not apply. The manager left us undisturbed for the next few days. Meanwhile the orang-outang had been given some brandy, obtained on a prescription, and after a short time was ready for the trip across the country."

For the most part the animals and snakes for parks and museums are obtained from professional collectors. Most of these men are world travelers who make a business of capturing curiosities of all sorts.

"Out of 111 species of snakes found in this country, but 17 are poisonous," Mr. Ditmars told me. "There are 97 species of lizards, but only one of these is poisonous, and that is the Gila Monster of the Southwest. Most species of poisonous snakes are to be found in the South, but in parts of Pennsylvania and New York—strange as it may seem—the few northern species of venomous snakes are so abundant that poisonous snakes are actually more common than in the South. The poisonous snakes in the United States include the coral snakes, copperheads, water moccasins and the many kinds of rattlers."

The recognized treatment for snake bite today consists in applying a ligature above the bite on the arm or leg, and then enlarging the punctures with a knife so that there is a free flow of blood. Then the wound should be washed in a near-by stream and bathed in a solution of potash permanganate crystals. Next the anti-venom serum should be injected where it will gain general circulation, preferably in the abdomen. Of course, the important point is to get a doctor as soon as possible.

"People should realize that the United States is wonderfully rich in reptile life," Mr. Ditmars told me. "In fact, as far as I am personally concerned, I do not feel it necessary to leave the country to find things to study. There is enough work here to consume three lifetimes accomplishing it."

And this is the story of the boy who did what he wanted to and found his own peculiar place in the world.

Official's Attack on Rent Hogs Costs His Job

THE newspapers of New Orleans, under pressure of the Jews, of that city, have compelled the governor of Louisiana to call for the resignation of an official who tried to tell the whole truth.

Morgan D. E. Hite, an architect and civic leader, had been named chairman of the Louisiana Housing Commission, which was created by the 1920 General Assembly of Louisiana. He began an investigation of rent profiteering in New Orleans, and discovered that Jews were the profiteers. At the outset the three local daily papers were backing him. Then he made an address in which he vigorously attacked the Jew landlords and real estate agents, who continued to raise rents while the prices of almost everything else were descending.

One newspaper printed Mr. Hite's speech, and then this paper joined the others in their attacks on him. The result of the pressure was the ousting of Mr. Hite.

As chairman of the Housing Commission of his state, Mr. Hite ran up against a cold and cruel combination that exploited the poor who rented houses. The longer Mr. Hite bucked that combination the clearer it became that there was something peculiar about it. When he plainly discovered what it was, he told at a meeting what he had found.

The speech was given on the evening of August 23 and reported (without informative headline) in the New Orleans *States* of August 24. The following report is from that paper:

Mr. Hite said he has found one particular group of real estate people are the chief offenders. He made it plain they are foreigners or of foreign extraction, and he said the American real estate men should be ashamed to let these people come into the field and ruin a prosperous business.

Mr. Hite said in part as follows:

"I will name one element here tonight—but there is another less serious, and found among landlords mostly as these others are found among the real estate agents, which I will name at another meeting.

"The element which has put the screws on are seldom owners of real estate, except apartment houses, but in recent years they have entered the real estate brokerage field and now practically dominate it—I might almost say, have ruined it—and the pity is that Americans have permitted themselves to be crowded out, Americans and American fair dealing methods crowded to the wall, and none so mute, inactive and passive in the face of these things as Americans, open-minded and fair and not seeing the real purpose until they are literally hit in the face.

"That is the great fault of Americans; they see fairness in all and do not raise suspicion, and seldom hit back until violence is laid on them. But not so silent and so high above suspicion is this other element. No sooner the rent call was sounded by me on the Fourth of July, than the attack commenced; immediately the voices, in anger and in bullying tones, were raised and for weeks the city was a patient listener to the howling of the pack against one lone man.

"Within the Housing Commission itself, from the very first day when it convened, has the opposition of this element raised itself against me. It is always quick to speak for itself and to bully over others, over Americans who prefer to sit quietly and do not often give expression, and in all the walks of life and through all our civic ramifications, with a few glorious exceptions, we find this element present and always thinking of A Number One and consciously or unconsciously working for its own aggrandizement and benefit, and working into control.

"From the highest down to the most ordinary field of endeavor, this acute and sharp-witted element is found taking advantage of every circumstance to hedge itself within stronger bounds. And Americans, to their shame, sit by silent, supinely sit, and let them put it over on them. In many cases they even help with all their power to play the game of his insidious element, unknowingly, of course, but they are swept into it and know not what they do, until some day they all wake up to the realization, and then let everyone who has unwittingly been made a tool, an instrument of this element, do penance for the evils he has helped to bring down on his city, as we now see in the real estate business.

"'If the people would only stand up like men,' a great man of this state said, 'and with one voice cry out for justice, the elements that are responsible for the present conditions would scurry to cover, and once and for all the people who in fear and trembling today report to me their cases of oppression would be freed and would need to fear no longer.' But because the cry of the tenant families is low and under cover, because they are afraid for their very homes, this element took courage and thought to go through with the monstrous program of tenant-hunting. Silent today they are, it is true, after having exhausted all their first means to cry me down, and to bully the public with their loud and aggrieved cries.

"There in the Housing Commission I felt their influence against me. There in the Young Men's Business Club, for three weeks now, a resolution has been pending, introduced by that self-same element, a resolution against me, and the young Americans of that club have fought it back, perhaps not knowing why, and have held it back against almost violent tactics of the opposition led by members of this element I speak of. Tomorrow it comes up again for a vote, and I hope that good old American names like Dunbar and Mabry and Ewing and Van Buren Harris will be able to win out against the forces led by those others.

"All through my months of exertion to get housing bills through the Constitutional Convention, one man in particular would rise up and oppose me at every turn, a man who pretends he is desirous of helping the housing situation, and yet who has done all within his power to prevent new buildings getting started—Alfred Danziger is his name, a brother of George Danziger, the real estate agent, of whom some other things might be said. Alfred Danziger has been more instrumental in holding back a building program by his hostility to me and my purposes than any other one man, and he never misses an opportunity to do and say what will, in his estimation, put an effective stop to building. He has certain interests to protect. Then I could tell a story of a close relative of his and his dealings with a poor woman of this city, and of an attorney whom she mistakenly went to see, also of the same element, and what he also did to her, the details of which I am not free to disclose now. Then there was the loud and unfair tactics of another of this element. Meyer Eiseman, president of the Louisiana Real Estate Board, who sought to get from me information that he knew had been given me in confidence by terrorized tenants, sought to get me to break my pledge to these poor families, and sought by means public and mean to do so. That shows how high is their conception of duty and honor!

"Notice that among all those who raised loud voices and published tirades against me, no Americans but one was to be found, and that is a shame to say, Carroll Walmsley, who joined in with the pack. Mr. Walmsley, I am convinced, did so through a mistaken idea of his position as chairman of the real estate bureau of the Association of Commerce, and abandoned his attacks when he realized what he was doing, that he alone of all American real estate men, was baying on my trail with those others. Loud against me in the beginning, Charles Roth, of Roth & Rosenberg, and Leo Fellman also appeared in public and Jacob and Ashton Blum—note the names! Do not confuse him with Joseph Blum, whom I deem a gentleman. Then there were others. Weiss, of Weiss & Dreyfous, Albert Bear, and some others, who were less active against me, and whose names I will withhold. On the Housing Commission there was another, Goldstein. In the evidence sent to me on the rent situation appears more of the names. Rosenthal & Klein, and there is still another loud in his thunder, Bodenger of Algiers. Note how compact is this element, how the chorus swells, and how in all this we find American names like Walmsley only for a moment, and so on through many of our civic activities influence of this element, compact and unanimous is found, even unto the supreme court of the state, where one this day seeks place whose brother, Charles Godchaux, acknowledges he is the Godchaux in the syndicate made up of other Jew names—strange to say—which was among the first to realize the profit-making possibilities of rents, and last summer took the tenants of the old Hibernia Bank Building by surprise with their extraordinary rent raise and sharp terms, or get out—and no place to go. As Governor Hall said the other day, you will more often find these people on the side of the oppressor than on the side of the poor and oppressed, and I feel it my duty to bring out the close connection between the rent conditions and this element in this city, and how unanimous has been their voice against me, instantly as they do always, to rise in protest when their vested rights are jeopardized. But as against them, and tenant families of this city in this housing emergency, I cast my lot with the tenant families, with the Americans, with the majority who are at the mercy today of a predatory group, of which this element may well be placed, and whosever takes sides against the tenants takes sides with that other that I have named!"

No other paper printed the address, but in the evening the New Orleans *Item* came out with a front page editorial denouncing Mr. Hite, attributing his utterances to the "hot weather" and "overwrought hysteria," and generally castigating him in a manner to indicate either that Jewish journalists did the job, or that Jewish pressure put the office on the jump. "Mr. Hite's speech is omitted from the *Item* on the judgment of the editor," says the news story.

Next morning the New Orleans *States* sought to make amends for what it had done by printing an editorial entitled, "An Outrageous Attack" in which Mr. Hite's statements were described as "atrocious," and the good old humbugs of "intolerance" and "religious issue" were dexterously drafted for duty.

Two days later the *Times-Picayune*, which also omitted Mr. Hite's speech "on the judgment of the editor," came out with an editorial proposing the ousting of Mr. Hite from his position.

In fact, when through some as yet unexplained factor, the policy of *suppression* failed, the Jewish policy of *oppression* for the truth-speaker was immediately invoked.

THE DEARBORN INDEPENDENT has long known the Jewish situation in the South, and it was clearly only a matter of time when a protest had to break forth. What is important now is the reaction of New Orleans—whether that city will cringe under the Jewish whip, or stand by one of its own people who has dared to speak plain words.

> Governor Parker, of Louisiana, demanded the resignation of Morgan D. E. Hite when the latter revealed Jews as the rent profiteers of New Orleans. The letters exchanged read:
>
> "Dear Sir—On my return to Baton Rouge I find yours of the 27th instant, which has had my very careful reading, and in view of your public statements, I am very frankly writing to say that your usefulness is at an end, and to request that you kindly return your commission, together with your resignation.
>
> "JOHN M. PARKER, Governor."
>
> Mr. Hite replied:
>
> "Governor Parker has proven himself to be another Pontius Pilate of a kind. Pontius Pilate was also a governor and listened to the cries of the Jews for the blood of an innocent man.
>
> "MORGAN D. E. HITE."

Closed Doors—Why Conference Will Prefer Them

Concluded from page 2

fice or out, are not the logical men to select for the purpose. They cannot be in sympathy with the problem President Harding seeks to adjust for the benefit of all. In saying this I have in mind the composite attitude of statesmen I know. It is a peculiar attitude that renders them intolerant of theories that have surfeited them in the past.

It is not heresy to declare and aver that *public men of the passing generation cannot entertain a very receptive opinion about the efficacy of disarmament.* It is a topic that occupies many a file in the State Department, or in Downing Street, or in Quai d'Orsay, or the Consulta, or even Wilhelm Strasse, where it received its deathblow about twenty years ago. Statesmen who have dealt with disarmament have become so convinced of its alleged impracticability that they cannot respect it very much. Can it be said that they would sincerely advocate it, and could they be expected to face universal publicity with parliamentary records rich with past cynical observations?

Just how veteran statesmen will be able to give the plan their unalloyed enthusiasm, and later justify their change of heart at home, is indeed a mystery. *Secret conferences, therefore, offer a means of escape,* in that it gives them freedom of discussion without an uncensored record to explain afterward.

In the question of disarmament the President is not so optimistic as certain Republican organs picture him. He issued the invitations for what they may be worth. The conference can be no stronger than its weakest delegate, which means the least willing nation. He can rely, and do no more than that, upon the good sense and co-operation of the delegates. These delegates will not have absolute powers; whatever agreement they will reach, directly or otherwise, will be subject to review by the ratifying powers back home—and that is an immeasurable step.

It is obvious that if the success of the disarmament conference depends upon its participating missions, these missions are entitled to the right of determining the rules and regulations under which the conference will be carried on. Undoubtedly the President would be happy indeed to have it open to a few press association representatives and an adequate press—not publicity—department that would make provision for the quick distribution of news matter, unabridged and undoctored.

Most discouraging, despite the alleged effect that such an imposing number is supposed to have, is the report that the delegations will consist of a hundred and more members, so that unless the number should be curtailed, which seems improbable, the conference will deploy something like seven or eight hundred members. Making allowance for clerks, assistants, secretaries and interpreters, which a liberal estimate fixes at three hundred, it would seem that the delegations proper would be a small army in itself. The press of Italy has already alluded to the "junket" of favorite sons of favorite politicians.

It is probable that after much casting about the chief delegates from each nation will be ministers in active service, and probably premiers themselves. This means that the conference would be a duplicate of the Paris Conference, with its Big Four. The rest would be a council, to include the high functionaries, while the remainder would be classified as military and naval experts or the like.

The point, however, is that the disarmament conference, as an effective conference, will consist only of the extraordinary ambassadors, if that is to be their title. They alone will have the right to speak for publication, on their own responsibility and in behalf of their respective governments. Possibly not more than a score of men, altogether, will make addresses or give statements which the press would feature on first page. It is quite easy, as a result, to see how simple the question of publicity would be if these chief delegates decided to simplify it.

The greatest objection to the proposed conference is the reported size of each delegation. It is top-heavy. It will be the means of injecting into it a sprinkling of delays that had better be avoided. The press in Italy has already alluded to the "junket," of favorite sons of favorite politicians. The more people the more there may be cause for secrecy.

The subject itself offers no difficulties unless these be artificial. It is a matter of statistics to decide what and how much and when to suspend and even destroy of existing armament. Only a few leaders could and would decide these points; and it is difficult to justify a delegation of a hundred or so men, in view of the fact that the American Government will provide all personnel facilities of routine nature.

Animals of the World in the Long Ago

By COURTENAY SAVAGE

IT WOULD be startling, to say the least, if a hunter, wandering in search of game over the Bad Lands near Medicine Bow, Wyoming, should suddenly find himself facing a beast more than 60 feet long, 15 feet tall at the hips, and weighing close to 40 tons. The hunter probably would drop his gun and run, that is, if he were not frightened out of all power of locomotion. And the great beast, lacking brain power in proportion to its size, probably would gaze in wonder, and go on munching the water grasses.

Of course, it would not be possible for such an encounter to take place in this age and day, for while what we call the Bad Lands of Wyoming were once the feeding grounds of that gigantic beast we call the Brontosaurus, that beast, and all its fellow creatures, had vanished from the earth thousands of years before the appearance of the first man.

It is only in comparatively recent years that men have gained any knowledge of the prehistoric animals. Dr. Frederic A. Lucas, the director of the American Museum of Natural History, in his book on "Animals of the Past," tells that it was not until about 1830 that scientific scholars began to show interest in the huge bones that were occasionally found in the earth, or in the strange footprints that were seen embedded in the rocks. And it is to our credit that the scientists of the United States were quick to realize that they had a key to the past, and began to excavate in the earth where they believed they would find the remains of the ancient animals.

"The now famous tracks in the 'brown stone' of the Connecticut Valley seem to have first been seen by Pliny Moody in 1802," says Dr. Lucas, "when he plowed up a specimen on his farm, showing small imprints, which later on were popularly called Noah's raven. The discovery passed without remark until, in 1835, the footprints came under the observation of Dr. James Deane."

At that time, Dr. Lucas goes on to point out, the family of huge prehistoric reptiles we now call dinosaurs were virtually unknown, and it was believed that the tracks in the "brown stone" were made by birds. In the years that followed, however, it was found that the Connecticut River Valley was rich in fossil material, and it was there that the first skeletons of the dinosaurs were found.

In more recent time, even since the beginning of the present century, American scientists have organized expeditions that have discovered valuable data regarding the world's first animal life, and much of the most notable material has been found on the North American continent.

A famous remark once stated that "everything in nature is engaged in writing its own history." Certainly the men delving in the earth in search of the remains of ancient animals have proved that remark to be true, for as they turned over the rocks and soil they have not only found the skeletons of strange animals, but they have found imbedded in the rocks, tracery of the plants on which they lived. Even the most casual wanderer in the northern forests may find a piece of sandstone in which there is the imprint of a fern or flower, and it is possible to find the fossilized remains of ancient snails in limestone deposits (as for instance along parts of the shore of Lake Champlain).

Fossils are found, of course, in varying states. They may be turned to stone, they may be fragile. And just because an animal has become extinct its bones are not necessarily fossils. The general understanding of the word, however, is that a fossil is a bone of an ancient animal preserved by the action of the elements. The action of the air, of course, would decay a dead bone, and that is why fossils are found buried in wet ground, or covered with water.

If an animal should die on the ground it would not take long for the rain, sun, and snow to destroy the bones. Plant and animal life also would aid in the destruction. In the same way an animal that died in the ocean probably would be destroyed in a short time, for the action of the waves, and the movement by the waters of the stones on the ocean floor, soon would wear out the bones.

But it would be different if an animal were to drop in the depths of a quiet lake, or a small river bed, where the still water would not move the body, and the mud and sand that belong at the bottom of the lake would settle about the bones, gradually forming a covering, and at the same time protecting them from harm, and in some cases turning the bones to stone. At least two great dinosaurs have been found with the thigh bones in their sockets, and the ossified tendons running through the backbone as in life.

In the course of the years, thousands and even millions of years, the surface of the earth has naturally changed. The lakes and rivers in which the ancient dinosaurs died have dried up, but not until they had added layer after layer of mud and sand to their bottoms, and so preserved the bones of these beasts. The lime and silica of the earth formed rock—and the bones were imbedded for all time. These exact changes are not definitely known, but roughly such is the story of what happened.

1. Brontosaurus skeleton found in Wyoming—compared with the skeleton of a man. 2. Brontosaurus on their feeding grounds—from a restoration painting by Charles R. Knight. 3. Smilodon skeleton; saber-toothed tiger. Note one tusk had been broken off. This beast lived before the coming of man. 4. Saber-toothed tiger—from a restoration painting by Charles R. Knight. 5. A running dinosaur. Skeleton of the Gorgosaurus recently placed on exhibition in the American Museum. It was found on the Red Deer River, Alberta. 6. Gorgosaurus pan jazt!

While the dinosaur, or terrible lizard, family were not the first animals on earth, they are perhaps the most interesting. When they lived, millions of years ago, the Rocky Mountains had not been formed, and our great Middle West was a place of marshes, of stagnant lakes, covered with swamp vegetation, and the ocean came close, it being known that great deep sea monsters swam where the Kansas cornfields now grow. Most of the life of that period was of the reptile variety, and they were practically lacking in any brain power.

The Brontosaurus, or thunder lizard, probably is the most interesting of the dinosaur family. It was a huge beast, and roamed the northern section of our continent. Its size may be judged from the fact that an expedition from the American Museum of Natural History found a skeleton near Medicine Bow, Wyoming, that when restored measured 66 feet, 8 inches, in length, stood 15 feet, 2 inches, at the hips, and must have weighed when alive about 40 tons—a weight that would shake the earth at each step. One of the massive thigh bones weighed 570 pounds.

The Brontosaurus lived both on land and in the water, but always made its home near the water, for its food consisted of herbs, water grasses, and so on, and it probably ate 600 or 700 pounds of vegetation in a day.

Further north, in the great fossil beds of the Red River section of Alberta, Canada, have been found the remains of the Gorgosaurus. The Gorgosaurus, unlike the Brontosaurus, was a flesh-eating animal. This beast, also a reptile, was in many characteristics like a gigantic lizard, but with long, heavy hind legs. Like the modern lizard, the Gorgosaurus ran on its hind legs, and the tracks left in the rocks show one foot in line almost directly in front of the other, a very narrow tread, and no trace of the waddling stride of a short-legged animal.

The Gorgosaurus of Alberta was a descendant of the Anchisaurus whose bones have been found in the Connecticut River Valley. The Anchisaurus, however, lived years before the Gorgosaurus, and was much smaller. The Gorgosaurus of Alberta was a swift racer, and its small front limbs could not support the weight of its body, so to help keep its balance this beast used its long tail.

Still another lizard was one whose remains have been found in the great chalk cliffs of Kansas, showing that at one time Kansas was part of the ocean bed. These were marine, or swimming lizards, capable of swimming at great speed and for great distances, because of their paddle-shaped feet, and great propeller tails.

Also from Western Kansas come the remains of the giant flying lizard, which in life must have resembled the bat. It had long claws by which it hung from trees, and a dagger-like bill.

There were feathered giants in those days, too. The largest of them seemed to have lived in the tropical countries, the islands of New Zealand, Madagascar, and the Patagonian regions. In comparison with any of our modern birds, the giant Moa of New Zealand was a tremendous creature. It probably stood more than 10 feet high.

Coming down through the ages we find a period when the huge beasts were dying away, and in their place came the mammals—the saber-toothed tigers, the mammoths and the mastodons. These are more or less closely related to the animals of today—to the tigers and elephants.

The saber-toothed tiger roamed over what is now North America and Europe. They were savage beasts, even more terrible than the tiger of today.

By the skill of modern science men piece together any missing sections, and so restore the skeletons.

Such a work is always a long and difficult process. It requires skill and patience to extract the huge skeletons from the earth, and prepare them for exhibition. The fossil bones are generally fragile, and it is not easy to remove the rock in which they are found without injuring the bones; and when the bones are cleansed and restored, their size and weight make it necessary to devise an elaborate method of supporting them. The framework of the mounted skeleton resembles a single block, but often consists of seven or eight sections, each framed with wooden and iron braces. The whole skeleton is generally faced with a thin plaster of paris surface backed by a wire mesh.

A miniature flour mill has been set up by the Bureau of Markets in Washington for experimental purposes.

Pig iron made from melted magnetic sands in Japan will, if successful, revolutionize the steel industry, according to reports from that country.

Caruso was his mother's nineteenth child.

A honey bee can outfly a carrier pigeon for a distance of three miles, according to the findings of a German scientist. In a longer race, it is stated, the pigeon would win.

Ivory from the remains of mastodons to be found on the Yukon and Norton sound tundras is the object which is luring ivory hunters north this summer. Lately there has been a regular trade for the ivory found in the floes of ice and glacier moraines north of the Yukon River.

A mountain of calcium phosphate, or lime, 25 miles long by 10 miles wide, is located 20 miles north of Las Cruces, New Mexico. The lime oozes out of the earth like the waters of a boiling spring and when the sun is shining brightly one cannot look on its glaring whiteness without wearing smoked glasses.

"Your dog is welcome. We will feed him without charge," is the sign on the window of a New York restaurant in the theatrical section.

Sending their "first night" floral tributes to hospitals is an old custom of Broadway actresses.

An outdoor elevator stationed between two buildings and serving both is in operation in Los Angeles. It operates "open-air" cars owing to the lack of inclement weather and enables passengers to view the city, as the buildings are located on a high elevation. At each landing there is a door into each building, the elevator car being fitted with a door on each side.

A homing pigeon is claimed to have recently broken a world's record by covering the 614½ miles between Chicago and Beltsville, Maryland, near Washington, D. C., in 27 hours elapsed time, which means less than 16 hours actual flying. The bird bore a message from Mayor Thompson to President Harding.

Wireless telephone communication as an aid in its work against forest fires has been successfully established by the Forest Service in Idaho.

The use of radium to color colorless stones has proved partially successful. Colorado topaz was tinted yellow by exposure, but the color was not permanent. Experiments with a view to making the color permanent are being carried out.

The United States Pharmacopoeia is being translated into the Chinese language, and it is believed that through the adoption of American standard formulas for medicines and drugs the American drug trade will benefit largely.

Red clay is used in the manufacture of cocoa to give it color and to preserve it. Practically all the tropical exporting houses have adopted this method.

Twenty-one thousand watermelons were dumped recently along the railroad right-of-way near a small town in Kentucky because the consignee in Cincinnati refused to accept them on account of a glutted market. Mountaineers and their families rode down from the hills to partake of the feast.

Theodore Roosevelt, during hunting trips near Mattawahkeag Lake, Maine, often sought seclusion beneath a tree at the mouth of a brook to read the Bible. A small tin box containing a Bible has been placed by the tree together with a request that all who go that way pause long enough to read a few passages of the Scriptures.

An automatic coupler which connects the steam, air, signal, electric light and telephone lines on trains without manual aid of any kind, has been invented.

An old Roman road that ran from London to Manchester has been discovered in England by workmen who were digging manholes near Farnham. The road was in excellent preservation, the surface layer being composed of flints and a foot in thickness, necessitating the use of drills to penetrate it. Engineers say the road was capable of carrying heavier traffic than any modern road.

James Watt's tools still lie just as he left them a hundred years ago in his attic workshop at Heathfield Hall, near Birmingham, England. It is proposed to preserve this sanctuary of science to the British nation.

A twelve-ton cheese is being manufactured for exhibition at Syracuse during the New York state fair.

Citizens of the United States only are permitted to hold jobs on public works in Seattle.

The average age of penitentiary inmates is 19 years, according to statistics recently supplied by the New York State Prison Commission.

Trade-mark covering the name of a farm of an Iowa farmer was recently published in the *Patent Office Gazette* by the United States Patent Office. The farmer is a breeder of pure bred hogs, cattle, and sheep, and the name of the farm as trade-mark is "Hawkeye." The trade-mark protects the owner of the farm products outside of the state in which the farm is located.

The gold dollar will replace the pound sterling as the standard on which the Italian gold lira is based.

The largest natural underground room in the world is located in Wind Cave, in the Black Hills of South Dakota, and is known as the Fair Grounds. It is several acres in extent.

The oldest bell in America is in the rectory of East Haddam, Connecticut. This bell bears the date "A. D. 803," and is believed to have been taken from an ancient Spanish monastery.

A hobo farm near Rockwall, Texas, it is said, consists of about 600 acres of the best black land in that part of the country, on which only hoboes without money are permitted to work. They get three meals a day, a place to sleep and the regular wages. Two brothers operate the farm, and it is said they are making a success of it.

Every day for 38 years Josephus Daniels has written his mother.

Unfolding an American flag containing the ashes of his father at an altitude of 3,000 feet over Long Island Sound, a New York aviator disposed of the remains of his parent in accordance with that parent's wish, as expressed just prior to his death.

Complete electrification of our railroads would enable them to haul 20 per cent greater loads without increasing operating expenses.

Wireless telephones are to be installed on important government express trains in Germany, and receiving instruments will be placed in hotels and embassies at Berlin.

Teasel growing is a thriving industry in Skaneateles, New York. The teasel is a plant producing a ball of porcupine-like quills, which are an indispensable element in the manufacture of broadcloth, felts, and woolen goods of the finer grades. The teasels are ranged on a shaft against which the finer quality of fabrics are run. The points are very brittle and as fine as the finest needle. The points scrape the cloth, giving it its nap or woolly surface.

Shang Ming, *The Life*, is a Chinese weekly newspaper which recently made its first appearance in Chicago. Only two other Chinese newspapers are published in America, one in New York City and one in San Francisco. Only four thousand characters are used, instead of the entire 40,000.

An ironing board used as a bridge between two buildings, one of which was afire, saved the lives of two women in New York City. One of the women, an aged paralytic, had to be carried by a policeman.

Fruit valued at twice that of Alaska's gold was raised this year in the Yakima Valley of Washington. In their best year the Alaskan gold fields produced $22,000,000, while the value of Yakima's fruit is $50,000,000 this year.

One million pounds of wool sent to textile mills in Michigan direct from a farmers' pool was turned back to the farmers in the shape of finished goods. By this method stagnation of the wool clip was overcome; the mills kept running full time and the farmers clothed in a new sort of homespun at about half the usual cost.

The Syndicalist at Work in America

By EDWARD JEROME DIES

A DEAD hush fell over the court room. The super-climax of a great trial had arrived. It was the hour of atonement for 100 men. One by one they stepped before the bar of justice. One by one they were sentenced by Federal Judge K. M. Landis for conspiracy to overturn the American war program. Some were given 20 years, others 10, others lesser terms.

There was William D. Haywood, "uncrowned king" of the Industrial Workers of the World. He blanched slightly as the maximum sentence was imposed. There was Georges Andreychine, the fiery young Bulgarian poet who left a revolutionary trail in the Slavic nations of Europe. He swayed, then turned and blew a kiss to his pretty bride among the spectators. Then followed others—Vincent St. John, Grover Perry, Carl Ahlteen who was always stroking his red beard; Harrison George, Ralph Chaplin and Aurelio Vincente—poets, authors, artists, students of economics and all have a queer philosophy.

It was a tense drama of life, this sentencing of 100 leaders of an anti-war campaign and of a 15-year fight to "take possession of the earth and its production machinery." When the last man heard his fate a woman outside the court room screamed. Another became hysterical and fought the guard. But the sentenced men remained quiet.

"We must be brave," counseled Haywood, as irons clicked about wrists. "No court can sentence an ideal. The I. W. W. will be bigger, more powerful next year and next and next, till finally it sweeps the world."

As dusk gathered about the jail that night the I. W. W. war-time revolutionary song burst from 100 throats—

> Onward, Christian Soldiers! Duty's way is plain;
> Slay your Christian neighbors or by them be slain.

In a few days the revolutionists were taken from Chicago to Leavenworth to begin serving their terms.

* * *

The scene shifts. It is nearly three years later. Enough time has elapsed to test the prophecy, "you cannot imprison an ideal," of "Big Bill" Haywood, the international executive secretary, who fled to Russia after the Supreme Court decided he must serve his sentence.

What has happened?

Today the I. W. W. has 250,000 known active members. A quarter million exponents of industrial revolution, all recognized "comrades" ready to flash the red card of I. W. W'ism. This represents a membership increase of 100,000 in three years.

To this 250,000 add another 100,000 who are not members, who are not "reds," but who are rose-pinks and delicate shades of vermillion, who never miss an opportunity in classroom, factory or office to say a good word for radicalism.

Hundreds of I. W. W. organizers are in the field. Daily reports come from all corners of the continent and from overseas. All are directed to General Headquarters on West Madison street, Chicago. This central seat of action—a suite of offices covering two floors—has been presided over by Roy A. Brown, chairman of the General Executive Board, since he was released. Haywood and two score other leaders were out on bail for several months. All were denied new trials, but several of the leaders fled their bail.

The labor "observers," flotsam and jetsam of the industrial world, report by the hundreds each week at a station near General Headquarters. They receive instructions either from Dan Buckley, known internationally as an anti-militarist and extreme radical, or, in his enforced absence in Leavenworth, from his assistants.

"It's a strange fact," Buckley told me, "that a man is of greatest value to the I. W. W. only after he has been to 'college,' the big iron house with the armed door men."

Tons of literature are sent broadcast from Chicago. Other tons leave district headquarters in New York, Seattle, Minneapolis, Duluth, Kansas City and other points of concentration. In Chicago two editorial staffs are maintained, one for foreign language papers and another for English publications. Thirteen foreign language papers, four big English papers and a 60-page monthly magazine, *One Big Union*, are issued by the General Executive Board.

The dominating note in all is: "Men! Strike off the chains that bind you to masters. Go into the factories, the mines and workshops and declare yourselves. See the new dawn. Forward the revolution!"

It has been authoritatively estimated that 10,000,000 persons in America read radical publications each week. Four million of these are reached by I. W. W. literature, either current or that intended as permanent. Lumberjacks in the north woods read it in the glow of camp fires; its message goes to miners on the iron ranges of Minnesota and Michigan and in the coal fields of Pennsylvania; it reaches workers in the industries of the west coast and the mills of New England. Wherever workers concentrate it will be found.

The serious-faced men at General Headquarters are proud of the organization's growth. They say that whether its great leaders are in prison or out, it will continue its strides toward victory. For, they declare, "the eastern sky is red with the dawn of syndicalism."

* * *

Haywood began his checkered career as a youthful "mule-skinner" in a mine and has been in the public eye as an agitator of labor wars for 20 years. He was prominent in the Coeur d'Alene war in 1892. He was at the helm in the formation of the Western Federation of Miners in the jail at Boise, Idaho, the same year. He was tried for the murder of former Governor Steunenberg, of Idaho, and acquitted. He has been a member of the I. W. W. since its inception in 1905 and in 1915 succeeded Vincent St. John as general secretary-treasurer. He was president of the Western Federation of Miners during that reign of terror among western mining camps, when 40 murders were charged to its account; 40 murders to which Harry Orchard, the "destroying angel" of the organization, confessed.

Haywood is a giant in stature and strength, a powerful leader and a professed "eternal enemy of the employing class and all who defend the wage system."

"And the wage system must go," he declared, addressing a radical meeting in Milwaukee, shortly before fleeing to Russia. "You cannot kill the craving of a million souls dedicated to a single purpose.

"We have suffered terrible persecution. Our members have been jailed and starved. Two thousand were shut up in jails, prisons and internment camps in two years. Many are now in for life; others for long terms. A half million dollars has been spent for legal defense and another $500,000 raised as bail.

"But jailing us hasn't killed the I. W. W. It is going forward by leaps and bounds. Today it has 29 national industrial unions in the United States. It is spreading to every civilized country.

"We want universal industrial suffrage. We do not believe in 'a fair day's wage for a fair day's work.' We inscribe on our banner the revolutionary watchword, 'Abolition of the wage system.'

"A million membership cards have been written out, but all are not still card holders. Many have gone to industries unorganized. Others were sidetracked by war mobilization.

"Thousands of former card holders are within the American Federation of Labor trying to win it over. The numerical strength is no measure of I. W. W. power. The seed sown in America has become a giant plant whose foliage spreads over the world. Syndicalist movements of Europe have adopted our principles.

"Three and a half million workers in Russia are organized nearly in accordance with our program, learning to run industries through their unions. Australian workers have started to remodel on the basis of One Big Union. So has Mexico, and in South America our principles permeate most unions."

Small claim is made on Canada, for that country in settling its rich prairie lands is making each new citizen a self-appointed guard against "reds."

Other high I. W. W. chiefs reckon that at the rate the doctrine is spreading the transformation of all unions will be complete in two or three years. Then these unions will make common cause with the I. W. W., "after which," says Brown, "the future belongs to us. Today we are a great world power. And the principles we endorse make us humanitarians and lovers of our fellow men."

A somber picture of the present readjustment period is painted by the chieftains. The labor surplus is certain to cause great distress. Quick action therefore is necessary, they say. A special bulletin under the flare-head "The Unemployed—What Shall They Do?" was issued and its message transmitted to armies of workers in factories, mills and mines. The gist is: "Loaf on the job. Produce as little as possible and make room for more workers at high wages."

The I. W. W. chiefs say that in 1920 heavy immigration added materially to the membership. An overwhelming proportion of all members are foreign-born.

Sabotage—the silent, secret destruction of property by workers—has always been and is today the chief weapon of the I. W. W. In government hearings big employers have estimated losses from this doctrine in huge figures.

Sometimes these secret reprisals take queer forms. There is the case of 10 South Dakota farm hands. Their persistent demands were refused while the planting season was at its height. Weeks later the farmer waited patiently for his corn to appear. It showed only in streaks. Most of the vast field was barren.

Then one day a neighbor telephoned him to drive over to his farm on a rise some two miles away. From that distance the farmer looked back on his field. The growing corn spread across the 20-acre tract formed the giant design:

"I. W. W."

"But," says an I. W. W. book of instruction, "sabotage requires courage and individuality and creates in the workingman self-respect and self-reliance as a producer. Sabotage instead of being sneaky and cowardly is a courageous thing, an open thing."

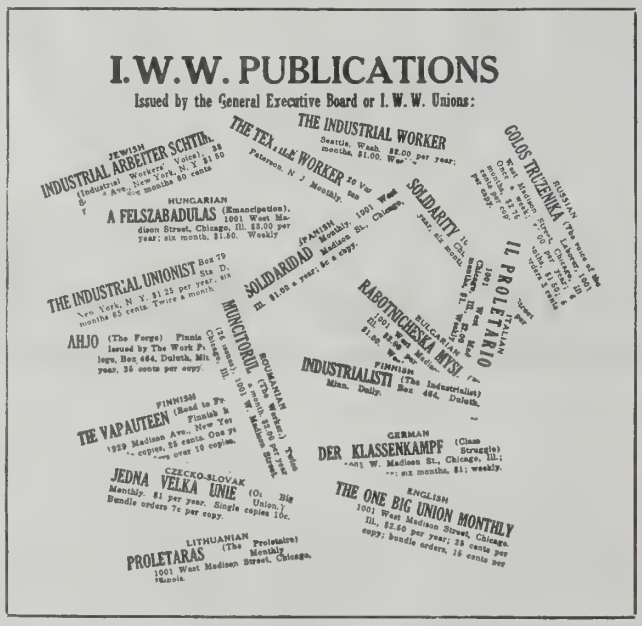
The black cat is a symbol of sabotage. It symbolizes silence but aggressiveness. The wooden shoe symbolizes revolt. A tale tells how a little Dutch boy, enraged one day by the rigid rules of his grandmother, suddenly removed his wooden sabot and shied it at her head with unfortunate results for the gruff old woman.

When tiny leaflets bearing the silhouette of a black cat make their appearance at a mine or factory it is the I. W. W. call for sabotage. The wooden shoe design appears later, when it is time to close the plant by strike. A worker practicing sabotage is called a "Sab Cat." Members of the I. W. W. are called "Wobblies." These verses, government evidence against the order, are characteristic of the more subtle sabotage gospel.

THE KITTEN IN THE WHEAT

> A sab cat and a wobbly band,
> A rebel song or two,
> And then we'll show the parasites,
> Just what the cat can do.
> The sab cat purred and twitched her tail,
> As happy as could be;
> They'd better not throw wobs in jail
> And leave the kitten free.

The continued growth of the I. W. W. in the face of successful government prosecutions in Chicago, Sacramento, Wichita and other cities is surprising. One explanation is that the order has absorbed scores of smaller radical groups.



During the war and for a year after many of these minor societies appeared. Later they apparently disbanded. The members remained radical, however, and joined other bodies. There was the Union of Russian Workers, with a membership of 4,000, the El Ariete Society, made up of Spanish anarchists, the L'Era Nuova Group and many other cliques with memberships ranging from 50 to 10,000. Thousands of these radicals sought refuge under the red flag of the I. W. W. when their own societies crumbled from government action.

There has been talk of the Communist Party of America bringing its 50,000 members into the I. W. W. fold. This party's announced aim is "to direct the class struggle to the conquest of the political power, the overthrow of capitalism, and the destruction of the bourgeois state."

Louis C. Fraina, international secretary of the Communists, is said to favor the I. W. W., which, he says, was formed because labor unions were incapable of struggling against capitalism. Craft unionism was deemed reactionary.

"Industrial unionism," said Fraina, "was urged, not simply for the immediate struggle of the workers, but as the revolutionary means for the workers to assume control of industry of the world. Other revolutionary movements united with the I. W. W. The Socialist Labor party was a vital factor in starting the I. W. W. in 1905, Daniel De Leon formulating the theoretical concepts of industrial unionism."

The I. W. W. feeling toward Bolshevism is most cordial. Agents of the I. W. W. are understood to have been in Russia for three years offering coun-

A symbol of sabotage. When the silhouette of a black cat on a wooden shoe appears in tiny leaflets, it signifies a complete tie-up.

A symbol of sabotage. When tiny leaflets appear bearing the silhouette of a black cat, the industrial barometer registers storm.

Top, left—"Live Wire Georgie" Speed, 70, the oldest active I. W. W. and secretary of the Board of Directors. Center—The nerve-center of the international organization. The second and third floors are the executive offices of the I. W. W. The building is at 1001 West Madison street, Chicago. Right—Judge Kenesaw Mountain Landis, "The Iron Judge" the I. W. W. call him, because he sent 100 leading "Wobblies" to prison; "Big Bill" Haywood, the man with his arms folded and looking toward the left in the lower picture, spent more time in court than out during the past two years. The man with the fur collar is Otto Christianson, Haywood's counsel.

sel and advice. But the organization did not publicly make known its stand on Bolshevism until recently.

"The Russian revolution," said an announcement by Brown, who is now the official I. W. W. mouthpiece in America, "is today a great fact. And the masses of the world are looking toward it for light and encouragement.

"Hemmed in by enemies, villified by the press of all lands, fought with arms and money, a prey of starvation and want, Soviet Russia still stands heroically working at her mighty task of creating a Workers Republic, an Industrial Commonwealth. The Bolsheviks have never said the present government is the final one. In everything Lenin and his friends have written, they have stated that the dictatorship of the proletariat shall continue until the transference of the means of production and distribution from the control of the capitalists to that of the workers shall have been completed.

"The attitude of our organization toward the struggling revolution of Russia should be that of wholehearted encouragement and fraternity."

Brown, George Hardy, general secretary-treasurer, and George Speed—"Live Wire Georgie" they call this 70-year-old veteran—escaped with light sentences for anti-war conspiracy and have taken leading parts in the international campaign.

The Negro membership has grown in the last three years. Numerous Negro organizers are in the field. The greatest Negro organizer, Ben Fletcher, who with southern lullabies crooned his way into the hearts of hundreds of marine workers, black and white, is under a 10-year sentence at Leavenworth. He was deemed a tremendous asset. Besides being shrewd and calculating, he was a quick-witted humorist, ready to turn a serious situation into merriment. His heavy sentence had scarcely been imposed when he dryly remarked: "The jedge is using poor English today. His sentences are too long."

WHERE DO THE WORDS COME FROM?

BACK in 1880 it was said that in a certain district in Old England the people used less than 800 words to express all their thoughts and needs.

Yet, your English dictionary defines and explains more than 450,000 words. The new editions will bring this to more than 500,000.

Where do all the new words come from? What use are they anyway? Bible truths are expressed in about 6,000 words and Shakespeare in running the gamut of human emotion needed only 15,000.

There seems to be an epidemic of new words. This is in a great part due to the war, science and faster communication. Our language began to show signs of rapid growth about three centuries ago. This was at the same time that modern science began to be exploited. New religions and new political creeds came into being at about that same time; these all needed new words with which to define themselves.

Travel from one country to another always results in the introduction of new words. The arts and sciences have taken over many of the old Latin and Greek words and these are adopted into our language. Commercial expansion and big business have coined new words. We have radio activity, telegraphy, telephony, meteorology, etymology, with their families of new-born expressions.

The automobile has given us words of which our best educated grandparents never heard. Finance, engineering, eugenics and even the soap box orators have contributed their share. There were no Bolshevists nor Soviets in Noah Webster's time.

The Great War and aviation produced many more new words; not only in this country but wherever the tides of conflict rose. We have "dud," "sniperscope," "tailspin" and other hybrid French-English words brought from overseas. Our boys, too, left many New World terms among the people with whom they associated.

The Pessimistic Mr. Beck

FOR woeful wailing of the blackest order commend us to the jeremiad delivered the other day before the American Bar Association by James M. Beck, Solicitor-General of the United States. Surveying mankind in the present generation from Greenland's icy mountains to India's coral strand, he sees nothing but calamity and disaster on all sides. He mourns the departure of the good old times when there was "more reverence for authority." Mutterings of revolution disturb his dreams. Nothing is as it ought to be.

In his admiration for the men of yesterday, Mr. Beck feels pushed to brand as worse than worthless the men of today and all their works in every field. He declares that all beauty and symmetry are vanishing from painting and literature before the audacious onslaught of "undisciplined and uninformed" spirits. For him, all light and leading was the divine monopoly of the Victorian painters and writers and we have bartered our heritage for a mess of pottage in according place to later painters and writers! All honor has gone out of business, out of politics and out of men, if we are to take Mr. Beck's words at face value.

It is to be feared that the eloquent gentleman's liver is out of order, or that he is succumbing to the ancient complaint of senility. His symptoms are characteristic of the atrophy that comes upon one who has fallen into the habit of traveling from Dan to Beersheba, as John Bunyan put it, seeing only vileness where other men see beauty and joy. The fact is significant that Mr. Beck seems to be moved to tears chiefly by the present insurgence of youth.

The shams and the shysters, the profiteers and the demagogues, like the poor, we have always with us. What of it? Have we not also brave and honest souls and that sincere and sound sentiment that ever puts roguery and pretense to shame? Crooks may flourish like the green bay tree for a time; but their end is sure. Today, more than ever, men know that there is a power that maketh for rightness; that progress is the law of life.

Remembering that chaos and horror of the war into which the rule and behest of old men plunged the world and from which we have so lately emerged, is it any wonder that youth is insurgent and challenging? Would it not be strange if impatience with the old accepted things by which we were led blindly into so fearful a trap should not express itself in even cubist art and astonishing verse?

No; the world is fairly safe after all. The disturbance youth is making everywhere evidences a wholesome and divine discontent. It means not so much disrespect for authority as determination that the authority that commands respect by being worthy of it shall be established in the seats of the mighty. What Americans all over the land are after is not revolution but better order in their own affairs and a larger realization and application of the principles upon which our Republic was builded by the fathers, and by which alone it can be continued by the sons.

The Mania for Protection

WHEN some years ago the "protectionist" idea reached its logical climax in "Schedule K," and, after menacing a wide split in the Republican party, was repudiated by the voters at the polls in an election that returned the Democrats to power, it was supposed that the country had learned its lesson and turned a bad corner.

Post-war politics, however, shows that the notion of having the government use its taxing power to tax profits into the pockets of one set of people and out of those of another—always at the expense of the consumer—is still very much alive. About the most brazen expansion of the mania is the proposition of certain railroad officials that freight-hauling motor trucks should be taxed by the state and the Federal governments to such a point that shippers will have to favor the railroads.

A more enlightened policy would recognize that there is business enough for all and organize to meet competition fairly. It may be well to tax motor truck companies operating under franchises, so that they shall pay a fair share of the cost of road construction and maintenance; but to levy a tax deliberately intended to hurt their business and limit their usefulness would be as stupid as it would be unjust.

Cannot Leave Out Lloyd George

SOME notion of the present French attitude regarding the British premier is suggested in a recent chronique of that sprightly boulevardier, Louis Forest, in the Paris *Matin*. A fair reader, complimenting him on his humor, begs him to continue to make people laugh. "That life may be pleasant is the great need of the times," she writes, adding: "And enough of that Lloyd George who no longer interests anybody!"

To this Forest rejoins in lively mock heroics: "What! Mr. Lloyd George interests nobody? For my part, he interests me hugely. If he continues his present policy much longer, my reader who would enjoy her laugh will wind up by weeping. It is fortunate that there are still among us those whom Mr. Lloyd George interests. They are the true protectors of the ladies' laughter. If Mr. Lloyd George continues, the lady who likes to laugh will see France isolated and impoverished. Will that be so gay? She will see the English, excluded by the Germans from the world's trade and taking out of our manufacturers satisfaction for their disappointment and vexation. That would be droll, would it not? . . . . Yes, the lady who wishes only to laugh exaggerates!"

The One Thing Needful

IT TAKES courage to really live—courage and hard work. For no man can be said to have life in him unless he has discovered and rejoiced in the discovery that fate has given him hard stunts, not easy ones. And the harder the stunt, the greater the victory and the greater the man. Rule and dominion always come to the overcomer of difficulties and obstacles. General Pershing has told us that during his campaigns in France he found that no sooner had he managed to accomplish a task which seemed beyond his powers than he found himself facing another and bigger task. And after this sort of thing had been going on for some time, he realized that his capacity for work enlarged with every task accomplished. The normal man is like the athlete, happy only when doing things worth while.

Courage, purpose, persistence, determination are all very well. We are all familiar with Buxton's saying that the longer he lived the more he became convinced that the essential difference between man and man, between the failure and the success, was concentration of purpose, holding an unconquerable will to achievement. But courage, determination, perseverance, concentration are all impossible without faith. With faith all things are possible and nothing is impossible.

The encouraging thing about General Pershing's example is its demonstration of the fact that faith grows by what it feeds on. The least atom of genuine faith, to begin with, will suffice for a starter. With *any* faith—faith "even as a mustard seed"—a man may be sure of that well begun which is half done. Like a muscle, faith increases with exercise until finally there is consciousness of that full self-confidence in which a man feels himself equal to any and every emergency, and doing the work which at first seemed difficult and doubtful with joyful ease and serenity.

The rich young ruler in the parable went away sorrowful because he lacked faith. The one thing needful, which had been overlooked in his training and his views of life, was self-confidence. Let no man run away with the notion that any career, any enterprise, any character likely to last, can be built up on other than the rock-foundation of invincible and unconquerable faith; faith in the worth of his work, his cause, himself. If he thinks to base his structure on the shifting sands of outside help or patronage, on conformity to custom or prejudice, on special privilege or favor from politicians or governments, relatives or friends, the day will surely come when like Humpty-Dumpty he will "have a great fall."

The Advance in the Price of Cotton

"HUNDREDS of millions of dollars are being added to the wealth of the South and a situation bordering on bankruptcy is being relieved," according to Eugene Meyer, Jr., chairman of the War Finance Corporation. This owing to brighter prospects for the financing of exports and renewed confidence among the small banks.

Cotton is America's largest and most important crop. In normal times, it makes up from 20 to 25 per cent of our total exports. This, Mr. Meyer frankly avows, is the reason he has been "paying particular attention to cotton." As a matter of fact, since the War Finance Corporation announced its first loan to Southern cotton growers on July 7 last, to "permit" the exportation of approximately 100,000 bales, the market price of cotton has gone up from 12 to 18 cents.

What Mr. Meyer does not tell us is that the main reason for this spectacular advance in the price of cotton is due largely to the discovery that English buyers and their agents quietly picked up about one-half of last year's crop at prices around six or seven cents—prices that spelled bankruptcy to the growers—and that these English buyers and a clique of American speculators are now gathering the cream of the recent rise in price.

To the man who stops to think a moment, it is evident that price manipulations of this sort do not add a penny of real wealth to the South. And the cotton grower and every other producer in the land is beginning to ask why those government-created and privileged "Gold Dust Twins," the Federal Reserve Board and the War Finance Corporation, should be allowed to play horse with the exchange values of their products?

A Picture Show Probe

THE resolution introduced in the United States Senate by Senator Meyers calling for a Federal investigation of the motion picture industry should be promptly adopted in the interests of common decency and of the continuance of free institutions in this Republic.

Over and over, this strongly organized interest has announced that it has "entered politics" and proposes to become "a factor in the election of every candidate from alderman to President, from assemblyman to United States Senator." And what is its test of candidates? Simply that they shall pledge themselves to governmental action favoring this one business, regardless of public morals and public interests.

In a hearing before Governor Miller, of New York, last April, representatives of the National Association of the Motion Picture Industry testified that absolute and unlimited power over the whole business in this country is in the hands of four or five men—those named were Messrs. Lasky, Loew and Fox.

The question is a vital one. If four or five men are allowed to gain a strangle hold on our state and national governments for selfish purposes, then representative government is at stake.

Wealth From Waste

WE MAY be a wasteful people in our handling and consumption of some things: food and forests, for instance. But American industrial genius is to be credited with splendid realization of wealth from what was once regarded as inevitable waste. Utilization of the by-products of petroleum and of iron furnaces and of Chicago's packing houses, by-products that once were a nuisance and a source of expense for disposal, now contribute a very large share to the annual dividends of these enterprises.

An example of the possible opportunities remaining in this field is suggested by a Standard Oil expert who has proposed that New York City collect the waste oil floating on the waters of its harbor in 50,000-gallon lots and use it for fuel in furnaces, or as road oil. Not only for the money that might be saved, but also for the lessening of the danger of destructive fires through ignition of the oil, this suggestion has a value that might find appreciation in all our harbor towns.

If a penny saved is a penny gained, the man who points the way to preventing waste is as truly a benefactor as he who makes two blades of grass grow where but one grew before.

Mr. Ford's Page

THE question of ownership is not so acute as it was. Not long ago there was a theory abroad that if so-called "private ownership" could be abolished and "public ownership" set up, then all our troubles would cease. It has been tried in various ways, on a huge scale as in Russia, on a small scale as in some American cities. The net result so far is this: if you propound a theory that the cook should be driven out of the kitchen and that the whole boarding house personnel should be brought into the kitchen to superintend the cooking of the steak, you might be fortunate enough to find a boarding house that would try out your theory. But from the standpoint of a well-cooked steak it is only a matter of time when you are going to call the cook back.

The question of ownership will be settled when it ceases to be acute; that is, it will settle itself. What the world is restless about is the recognition of certain ideas, not the general position of the people. Ideas have a hard time being born, and restlessness is part of the general operation. Once born, however, the effect is rather greater easiness of mind than a strong overturning of the fundamentals of life.

A man owns what is given him in his personality and what he earns by his labor—that, and nothing else. If a man has character, he owns it; no one can claim a share in it. If he owns self-respect and the respect of his neighbors, it is his, absolutely his. If he has the gift of foresight, if he has the faculty of insight, if he has the power to plan and to manage and execute, if he has the qualities of a leader—these are all his own. They are his in a personal, private sense. The mind and the eye are greater reapers, and what they reap cannot be taken from them.

But what else is his? What can he absolutely own in the physical realm? By common consent he can own all that he needs for the living of his life—if he earns it. Civilized mankind recognizes the investment of a man's soul and body into his home and all the material requirements of his life. That is what we mean by "the sacred right of property"—property is sacred by reason of the thought and sweat and blood that human beings have put into it. When you take that from a man, you take his life. Where property is not respected, life is not respected.

But what about all this other wealth—this great expansion of industrial wealth that we see all around us? This is what people mean when they talk about "ownership."

Well, take any big concern you may happen to think about. Who made it what it is? Everybody who had a hand in it. The man whose idea inspired it. The men he called in to help him. The public whose patronage supported the business. They all made it. They are the only ones who own it because they are using it.

Well, but what about the "millions" that the business has made? Let us see where those millions are. There are "millions" in the buildings, "millions" in the machinery, "millions" in the outlying sources of supply, "millions" in railroads and tank cars, "millions" in material, "millions" in goods on the market.

Now, no one can put those "millions" in his pocket when he goes home at night. No one "owns" those "millions." They are out in use by hundreds of thousands of people all the time. If tomorrow the world should be turned upside down and another "class" should take control of business, it would have to leave the "millions" right where they are—else there would be no service nor business.

That was the crude, childish thing that occurred in Russia. They rushed in and took those "millions" out and then wondered why they could no longer produce their daily bread.

There is a great deal of misunderstanding about wealth. Wealth is not money. Wealth is in things of use. That is where all the wealth of the big industrial institutions is—in things of use. All of it lies out-of-doors. It cannot be locked up in safes. If, however, it were all divided equally, so that everyone now participating in its operative benefits could participate in its dead value as material, what would it amount to?—this one would have a few bricks, that one half a wheel, another a pile of junk.

In fact, it was only because all this material and all this effort was successfully taken out of the field of absolute private ownership and piled together into one well-planned whole, that the public could be served as well as it is. Redistribute it all back to its private ownership, and the public is left gasping for everything that it needs.

But what people usually have in mind when they talk about "ownership" is not the question of who ought to own the bricks and the mortar and the furnaces and the mills, but rather the question "who ought to be boss?" That is really the big question in most minds. "Who set this man over us?" is the often unspoken challenge.

Well, this is very much like asking, "Who ought to be the tenor in the quartet?" Obviously, the man who can sing tenor. You could not depose Caruso. Let any theory of musical democracy come, depose Caruso to the musical "proletariat"; very well, there is no substitute; Caruso's gifts are still his own.

Who will be the leader of the army? The man who can lead. Who will be the pilot of the ship? The man who knows the way. Who will be the leader of the country in a moral emergency: men say this one or that one, but God said "Lincoln."

In lesser things it is the same. The man who can, is the man who does. No one chose the real leaders of today; they came forward because they could lead, and men followed them because they knew a leader. They came up from the ranks, all of them. The new leaders are in the ranks now.

Some young men, poisoned by the cynicism of a false social philosophy, do not believe this. They feel sore within, they are straining and stressing. That is good. That is the way leaders are born. There is a great deal of that kind of feeling before a man is forty. Don't interpret it as rebellion, it is growing pains. The old principles still hold true. Modern industrial development hasn't changed a single rule of life—and cannot! Go back to your grandfather's copy books, and what the maxims said then is true now. Men rise today, just as they have always done, by backing their native gifts with their acquired energy.

This much is certain: no one will long remain "boss" who was not called to that work by nature and development. It would be an extremely simple matter to displace all the "bosses" and leaders today, but it would be an extremely difficult matter to replace them. That was the trouble in Russia.

But say that by force you do replace the natural bosses with artificially created ones, what happens? Why, shortly there is nothing left to "boss," the whole thing has just crumbled away into uselessness.

So, there are correctives. In the natural course of events the incapable man cannot get into positions of power, but if through an unnatural, artificial course of "pull" or "favor" or "relationship" an incapable man does rise to that position, natural law soon begins to operate: he fails and his failure is apparent to all.

If there is a great industry which has ceased to serve the people; if there is a great industry whose leader has ceased to care for it and has begun to exploit it; if there is a great industry whose leader has been poisoned with the thought, "This is mine and exists for my benefit alone"—you will not long be puzzled about the problem of ownership. Nature will soon settle it.

THE question of ownership is very easily settled. Most of the "wealth" involved lies out-of-doors, and everybody has the use of it. Nobody can put industrial wealth in his pocket and take it home at night. It is not ownership, but leadership that bothers most people. "Why should he be boss, and not me?" is the deep core question. Industry is comprised of leadership and labor. Who ought to lead? Obviously, the man who can lead. If any other attempts it, he falls down. Only the man who can do the job has any right to do it. If he can't do it, Nature checks him up and replaces him. The wrong boss spoils the job. The right boss proves his right by doing the job right. It is as simple as that.

The Mortgage on the United States

What It Means to You, Who Must Lift It

By AARON HARDY ULM

THE mortgage of which I write is known euphemistically as the national debt. It now amounts approximately to $24,000,000,000. There is a set-off of about $10,000,000,000 which is owed us by foreign countries. That "set-off" so far has not affected a penny in interest or principal. We had as well make up our minds that the United States national debt is going to be paid *in toto* by Americans and no one else.

The market value of the national debt, the sum for which the evidences of it could be purchased at prevailing prices, is probably *ten per cent less than its "face value."* That is of no concern to us who must carry it, for interest is paid on "face value" just as the principal some day will be paid. But what does concern us is this: *The commodity value of the national debt is about one-third greater* than when it was contracted. That is to say, if we had to pay the debt now in current production, namely, in wheat, corn, cotton, live stock, manufactured goods, or labor—in almost anything except coal and transportation—it would take an average of one-third more than what was purchasable with the money when it was borrowed. *In fact, where the proceeds of a $100 Liberty bond bought only about 40 bushels of wheat when the bond was sold, it would now take about 100 bushels of wheat to take up that bond.*

Hence we have this peculiar economic situation with regard to the national debt: It was contracted in the main on a basis of 40 and 50-cent dollars: we have already reached the point where the interest must be paid in 75-cent dollars and are rapidly approaching that where both interest and principal will be payable in 100-cent dollars.

Synonymous With War Debt

BUT that singular turn of the financial wheel is not peculiar to our national debt as it stands. It has attended most national debts since bankers created the device; it particularly characterized our Civil War national debt, some of which, by the way, we still owe. It is coming to characterize the national debts of Great Britain and France, though Germany, by a process that amazes modern financing, appears to be reversing the process. Germany's war debt, contracted on a basis of marks worth 20 cents each, is being carried with marks worth only about 2 cents each.

To make clear what is stated above requires the presentation of some history bearing on national debts in general and ours specifically. For some reason it, in the main, has been ignored by historians. Though the military and political phases of war are made to fill volumes of history, the financial phases have rarely called for a single tome. Yet the financial phases are the ones that most touch posterity, which has to pay the bills.

National debt and *war debt* are almost synonymous. Small portions of national debts are sometimes contracted for purposes other than war, as in the case of a few hundred millions of our own which cover the cost of building the Panama Canal. Being for war, it follows that there is cardinal difference between a national debt and state and city or county debts. The latter usually cover some form of tangible investment, roads, buildings or other things that are of material service to those who pay, as well as to those who contract, the debts. Those investments frequently increase in value and often aid in the creation of other values that more than offset the debts. But national debts, being almost wholly for war, cover few permanent investments of a material nature; the money raised is "shot away," so to speak, as soon as or even before it is in hand.

Such has been the case since in December, 1692, William of Orange originated in Great Britain what the historian Macaulay says is "the greatest prodigy that ever perplexed the sagacity and confounded the predictions of statesmen and philosophers."

Bankers and War Loans

THE funded debt which William III established in England to finance his European wars, was not the first of national debts. They existed in various forms on the Continent for a century or more before William's time. Up to that period the process commonly was reversed; rulers usually accumulated funds in advance for wars. Most often they trusted to levies on and indemnities from the people warred upon to meet the costs. For emergencies they sometimes wrung cash from wealthy subjects. It is probable that those who were thus most often forced to come across—sometimes under the lash or while swinging by their thumbs—invented the device of funded war loans. Anyway the development of national debts of the modern kind and the great Jewish banking firms of Europe were somewhat concurrent phenomena. The House of Rothschild, for example, was builded and still rests principally on war loans and speculations in them.

It is interesting to note Macaulay's justification of the first British funded war debt.

"Why," he asks, "meet the extraordinary charge of a year's war by seizing the chairs, the tables, the beds of hard-working families, by compelling one country gentleman to cut down his trees before they were ready for the ax, another to take away his hopeful son from the University, when 'Change Alley was swarming with people who did not know what to do with their money and who were pressing everybody to borrow it?"

Many men predicted freely that the debt would be "the ruin of the country," and those predictions were steadily repeated as the debt grew into such volume as to cause the mother country to demand that the American colonies help to carry it.

The colonists refused to help carry a debt in the making of which they had had nothing to do. The American Revolution and American Independence were due, as is often forgotten, to resistance to national debt.

Yet our Revolution demonstrated that national debts can be justified and at times are necessary. The colonies were without large capital or machinery for mobilizing the capital that did exist. They also needed much by way of munitions and supplies which could be obtained only in foreign countries. They had no means for paying immediately for those things. So they turned to the Continent of Europe for gifts and credit. Most of the loans came from France and Holland, though some were procured in Spain. All Revolutionary foreign loans totaled only $13,000,000, however. In addition there were gifts and subsidies from Spain and France.

The American Revolution, with all of the heroism displayed therein, demonstrated a peculiar war psychology that still exists. People may be willing to make great sacrifices for a cause, to die for it in battle and to give to it the lives of their sons, but at the same time be obstinately reluctant about giving their property to it.

The colonists were for every war sacrifice except that involved in high taxes. Were they not fighting against unjust taxation? Then why apply to themselves the very evil they were opposing?

The result of that attitude was an adventure in finance that reads more like "Alice in Wonderland" than a story of real fact. Yet, modified, it is the story of all subsequent wars in which we have been engaged—a story of inflation and peculation, not only the shifting of a real burden from class to class but the creation of a fictitious burden as well, and one that in part was passed on to generations unborn.

The Continental Congress procured some domestic loans, but the total loaned to the nation by the colonists for the Revolutionary War was scarcely more than $20,000,000. There were other forced loans, through impressment of supplies, by which means alone could the army be maintained during several periods of the conflict.

What the Continental Congress sought to do was to finance the war with a printing press. Paper money, with nothing behind it except hope, was ground out like so many handbills. For a year it maintained something approaching par with currency, that is to say coin of intrinsic value. Then it began to fall. In line with the well-known law of economics the bad money drove out the good, with the result that business had to be carried on with depreciated paper money. The depreciation was expressed in advancing prices as happened again during the Civil War and also during the World War.

When U. S. Currency Depreciated

IN 1780 prices were 20 times those of 1774. Indian corn sold for as much as $150 a bushel, butter for $12 a pound, tea at $90 a pound, sugar at $10 a pound, and a barrel of flour at one time cost as much as $1,575. In 1781 John Adams noted that he had to pay $12,000 for a suit of clothes and a pair of shoes.

Solemn conventions that "fixed" prices were held. It was made a crime for one to refuse the paper money. Mobs often took the situation in hand and inflicted summary punishment on those who did refuse, or who held what they had to sell for higher prices to come. Congress constantly reasserted its promise to redeem the paper money with real money, and made repeated appeals to the patriotism of the people on behalf of its paper.

But the laws of economics continued to operate, as they did in the recent war, in spite of attempts to control them by arbitrary measures.

Congress tried to bolster up the financial edifice with the prop of repudiation. "Bills of credit" were called in and redeemed with other bills of credit, which Congress said would certainly be redeemed in real money.

But the wave of depreciation continued. Paper money went to a parity of 100 to 1 with currency, and the phrase "not worth a Continental" became so fixed in the language that it survives to this day.

Finally the paper money went to 1,000 to 1 and then, in the language of Thomas Jefferson—but not entirely correct—"expired without a groan."

The "paper" cost of the Revolutionary War was $650,000,000.

The actual specie cost of the Revolutionary War was only $135,693,000.

When Hamilton funded the debts he had to issue bonds amounting to only about $75,000,000, which included also some Federal obligations acquired subsequent to the Revolution.

Hence the Revolutionary War "paid for itself" very largely as it went along, but, because of the extraordinary effort that was made to pass almost the entire cost to the future, it paid for itself at a price that was as astounding as it was unnecessary. And the cost fell largely on the backs of those who could not protect themselves and therefore were least able to bear it.

"All tricks of legerdermain with the currency bear most heavily on the poor," says Horace White in that classic textbook on finance entitled, "Money and Banking." While the debts of the Revolutionary War were being contracted on the basis of paper that proved all but worthless, there was—as again during the Civil and the World wars—an appearance of great prosperity throughout the country.

"Every form of wastefulness and extravagance prevails in town and country," a man of the period wrote, "nowhere more than in Philadelphia under the very eyes of Congress."

"The extravagant luxury of our country in the midst of all its distress is to me amazing," wrote Benjamin Franklin.

Rising prices, due to the issuing of multiform "bills of credit," had opened wide the gates of opportunity to speculators and peculators. Fortunes were made overnight. One with something to sell had only to hold it to be assured of immense profits.

"Speculation, peculation, engrossing, forestalling afford too many melancholy proofs of the decay of public virtue," wrote George Washington.

"Those murderers of our cause, the monopolizers, forestallers and engrossers!" he exclaimed on another occasion. How reminiscent, in all but phraseology, of a time quite recent!

But those with nothing to hold or sell made most of the sacrifices necessary for sustaining the false prosperity as well as the war itself.

A workman, as Professor Sumner has written, could easily lose his wage while earning it. During a great part of the period three months' pay for an enlisted man in the army wouldn't buy a bushel of meal for the man's family.

Showing how the minds of the most honest of men could become confused, George Washington himself directed his agent so to arrange his rents that they would be returned on a basis of sound currency. Richard Henry Lee provided for his rents being paid in produce, and, for it, was denounced as a Tory and beaten for re-election to Congress.

What they did was essentially what most others whom they denounced were doing, that is discounting the depreciated mediums of exchange issued by Congress.

"Produce Paid for War"

SOME went much further, however. Old debts made on a basis of real money were paid in the all but worthless paper. Advantage was taken of the country's needs and distress to make big private fortunes. It is recorded that a member of Congress delayed final action on a measure for purchasing a supply of grain until he could take part in a cornering movement by which the government was "held up" on the final sale. That member was a signer of the Declaration of Independence!

In producing the above citations there is no intention to discredit the heroes of the Revolution. The only purpose is to show that the patriotic hysteria which generally accompanies a war does not overcome the avaricious instincts of human beings. Instead, the hysteria is taken advantage of by cupidity; just as much so during the Revolution as during the late war. And war debt, with the accompanying inflation, is cupidity's best means for harvesting from that advantage.

Had the debt of the Revolution been "passed on," at full face value, as was done in subsequent wars, the nation would have crumbled under the terrific burden. Fortunately most of the debt extinguished itself—that is to say the "bills of credit" covering the bulk of it became so worthless that they were thrown away. When they were finally redeemed at 100 to 1, under Hamilton's refunding measures, only $7,000,000 out of more than $500,000,000 "outstanding" was brought forward. The people had destroyed the remainder as worthless. Thus, as some economists claim, most of the cost of the Revolution was met, after all, by taxes collected at the time.

"Except what was borrowed or begged abroad, the whole cost of the war was paid for by the 13 states out of their annual produce," says Horace White.

But the process by which it was paid entailed tremendous injustice—injustice that laid most heavily on the poor who could not protect themselves.

Hence you can understand why the sentiment of the country favored repudiation for the surviving remnants of the indebtedness which were refundable when the Federal Government was formed.

Wholesale Bribery in the Early Days

ALEXANDER HAMILTON'S greatest stroke of statesmanship—and practical politics—was the overcoming of that sentiment. He knew that the country must have credit, and it could get credit only by establishing a precedent of absolute honesty. Hence he was for funding what remained of the debt, in spite of the fact that the domestic claims, in the main, were in the hands of speculators who had paid but pittances for them. He also visioned the need for a strong central government; he, therefore, proposed that the Federal Government assume the Revolutionary war debts of the states. Most of the states opposed the latter suggestion, for the reason that only a few of them had been com-

(Concluded on page 10)

Bringing America's Heart to the Seaboard

THE magic wand of progress is to touch the Great Lakes into a fresh water Mediterranean. The seaboard is to be shoved to the heart of the continent. Three thousand miles of coast dotted with rich, productive cities is to be made accessible to ocean-going craft.

Then the hobbles on mid-western industrial development will have been removed.

The West is hurt. Its yearly losses through breakdown of a congested rail system are mounting to staggering sums. Embargoes, spoilage and interruption of industry are squeezing the profits out of factory, farm, mine and mill.

Iowa alone, according to a startling statement by Governor Harding, lost $250,000,000 in 1920 through transportation shortage. Crops could not be moved advantageously; many lines of business were halted and the major trade channels securely plugged. Iowa's dilemma is no different from that of many other western states.

The St. Lawrence deep sea waterway project today looms a beacon on the murky transportation horizon. Economists term it the premier waterway movement of the age.

It would make every lake port a seaport. Down an open road to the ocean would move unhampered the West's bountiful contribution to the world's bread basket. Down this water lane, too, would go fleets laden with slaughtered cattle, hogs and sheep, dairy products, wool, iron ore, copper and coal.

Railroads staggering under an ever-swelling burden would be relieved. Experts say efficiency of the national transportation system would be doubled; profits of agriculture and industry would be enhanced, and industrial power of western centers increased. Hidden resources of mountains and plains would be brought to light, the fuel famine of the seaboard remedied, and the coast and interior drawn to closer trade relations. Rates of transportation would be reduced as much as $10 a ton on some commodities.

And it would all reflect back to the dinner table, to the coal cellar and even to the little white tag on milady's hat in the shop window.

Cost of carrying goods from farm and factory to market, say the economists, is from five to ten times as much by rail as by water. They illustrate in this manner.

A horse hitched to a wagon can haul, at the rate of three miles an hour, two tons.

One horse power with a car on a steel tramway can haul 15 tons.

One horse power in a boat can haul 105 tons.

Before the war the average rail rates were .7 cents a ton mile; the average canal rates .2 to .3 cents a ton mile; the average ocean rates .1 cent a ton mile, and the average lake rates .07 cents a ton mile.

Development of the Great Lakes in the last 20 years may in a measure be understood, when it is considered that traffic exceeds in tonnage that of the Mediterranean and Black seas combined. More tonnage passes Detroit in nine months than sails from New York or Liverpool in a year.

But two natural barriers stand between the lake ports and the open sea. They are Niagara Falls and the rapids of the St. Lawrence River. Traffic is halted just above the falls and freight put on rails at Buffalo for the seaboard or shifted to small boats for passage through the Welland Canal and down Lake Ontario and the St. Lawrence River to Montreal.

The Canadian Government, ever alive to constructive measures, ranging from aid to settlers in the rich Canadian West to good roads and waterway improvements, is building a ship canal which will solve the first problem.

This canal, the fourth Canada has built since 1833 to move craft around the falls, is 25 miles long, deep enough for ocean-going vessels, and with its seven locks will overcome the difference of 326 feet in the levels of Lake Erie and Lake Ontario. The Welland Canal has 26 locks. The new canal will cost $75,000,000. It will be completed in three years and, the experts say, will be used by three American vessels to one Canadian bottom.

The second barrier, the St. Lawrence rapids, presents a simple engineering problem. The rapids start below Ogdensburg, New York, and end with the Lachine Rapids at Montreal. The rapids section of the river extends about 100 miles.

"It is proposed to drown out the upper rapids," said H. C. Gardner, president of the Great Lakes-St. Lawrence Tidewater Association, after the recent inspection trip of American engineers, Congressmen, governors and business men. "The level of Ontario will be regulated by a large dam near Cornwall. It will be 80 feet high and yield a net head of 74 feet minimum for power purposes.

"Two navigation locks at the dam will each be 80 feet wide, 800 feet long and 30 feet deep over the miter sills, and will have a lift of about 37 feet. Unrestricted navigation will be extended from Lake Ontario to the foot of the Longe Sault Rapids."

Below the dam the river channel broadens and forms Lake Francis, 30 miles long, which affords open navigation to the Cedars Rapids. To by-pass these the engineers recommend a channel 300 feet wide and 30 feet deep on the north side of the river. There would be two locks with a lift of 30 feet each. The river broadens again and forms Lake St. Louis, 16 miles long, and then come the famous Lachine Rapids.

"The whole construction," said Mr. Gardner, "would involve about 30 miles of restricted channel with six lifts and three guard locks. This development would net about 1,470,000 horse power at the lowest flow of the river. Power installation recommended would be on Barnhart Island and consist of 52 turbine wheels with electric generators having 36,000 horse power each.

"The total cost of the work, including power development and delivery of the power on the main switchboard, is $252,000,000. If it is decided to make all channels the full depth of 30 feet, $17,000,000 would be added, making the grand total cost of the St. Lawrence seaway $270,000,000."

New York's opposition to the project is slowly waning. The objections raised have been likened to those of the stage coach drivers between New York and Philadelphia in the early days of railroads. "We are unable to keep our coaches full," lamented the drivers. "So how in the world could a railroad pay?"

Experts say New York would be years catching up with traffic demands even if the St. Lawrence seaway were effected at once.

Ten years ago James J. Hill declared the railroads should spend $1,000,000,000 a year for five years in expanding facilities.

Five years later a group of experts reported that if traffic continued to increase for the succeeding 10 years on the basis of the past 20, the railroads would be forced to spend $1,500,000,000 a year, or a total of $15,000,000,000, to meet the demands of agricultural and industrial expansion.

The Central West, judging from statements by representative business men, is realizing the soundness of these predictions and is greatly alarmed over the prospect of a serious transportation snarl with the resumption of normal business and subsequent increased traffic.

Rapidly centers of production are moving west. Indiana is now the center of population; central Missouri is the center of farm acreage; Iowa of farm values; Nebraska of wheat; Illinois of corn; Wisconsin of potatoes; Illinois of butter and swine; Minnesota of iron ore production; Wyoming of bituminous coal reserves, and West Virginia of soft coal production. Eastern Ohio is the center of manufacture, measured by primary horse power, and Pennsylvania is the center of persons engaged in manufacture.

Chicago, half a century ago an overgrown village sprawling along the lake shore, has for years been the world rail center. Thirty-nine roads converge there. Forty per cent of the United States rail mileage terminates in Chicago. No train passes through the city. It either starts or finishes its trip. Last year 15,000,000 carloads of freight were handled through the Chicago terminals.

Chicago is within a night's ride of 50,000,000 persons. It is the focal point of the great productive area, the heart of the continent.

Sixteen states in the district that would benefit by the St. Lawrence waterway project pour part of their products into Chicago. These states produce three-fourths of the wheat of the country, 70 per cent of the corn, and half the cattle, hogs, horses, butter, eggs, cheese and wool. They mine 85 per cent of the iron ore, 40 per cent of the copper and coal, 75 per cent of the zinc and 45 per cent of the lead.

Take grain alone. Chicago has grown from a wagon load market to the hub of the world grain trade. The little brig Osceola carried away the first water shipment of grain one autumn morning back in 1839. The shipment totaled 3,678 bushels. The Chicago Board of Trade, organized by a handful of merchants 73 years ago, the year Chicago received its first telegraphic message, now handles 400,000,000 bushels of cash grain a year, and to carry on this huge business maintains bank balances of $200,000,000. Chicago's elevator space totals 55,000,000 bushels.

Julius H. Barnes, president of the United States Grain Corporation during the war; President Joseph P. Griffin, of the Chicago Board of Trade, and other economists estimate the St. Lawrence seaway would add at least five cents a bushel to all grain produced in the heart of the continent. The saving is placed by some as high as 10 cents.

On a basis of a 10-cent saving on transportation cost to European markets, such reductions, if fully reflected back to the mid-continent farmers, would in Mr. Barnes' opinion add $336,000,000 to the annual income. This is on the theory that the surplus export price determines domestic prices.

Should the farmers benefit only by the modest estimate of five cents a bushel, Mr. Barnes figures it would add $183,000,000 to the agricultural income of the Central West and $22,000,000 to the steadily swelling Canadian farm income.

Before the war, say government statisticians, wheat cost 10 cents a bushel between Chicago and New York, a distance of 1,000 miles. At the same time the average cost between New York and Liverpool, a distance of 3,000 miles, was three cents a bushel. Chicago is 37 miles nearer to Liverpool direct through the St. Lawrence than by rail and water through New York.

Grain is a prime commodity. But from a traffic standpoint equal importance may be attached to the receipt in Chicago and reshipment in part last year of 15,381,001 head of live stock and 2,412,887,000 feet of lumber. Shipments also included huge quantities of steel products, agricultural machinery and furniture. The bulk of the city's manufactured products, aggregating $6,500,000,000, was likewise dumped into the clogged traffic channels.

It is little wonder, therefore, that discontent over traffic conditions is increasing in the Central West. It is mirrored in all commercial activities. In late months it has been crystallizing into determined efforts to hasten the St. Lawrence seaway as a solution.

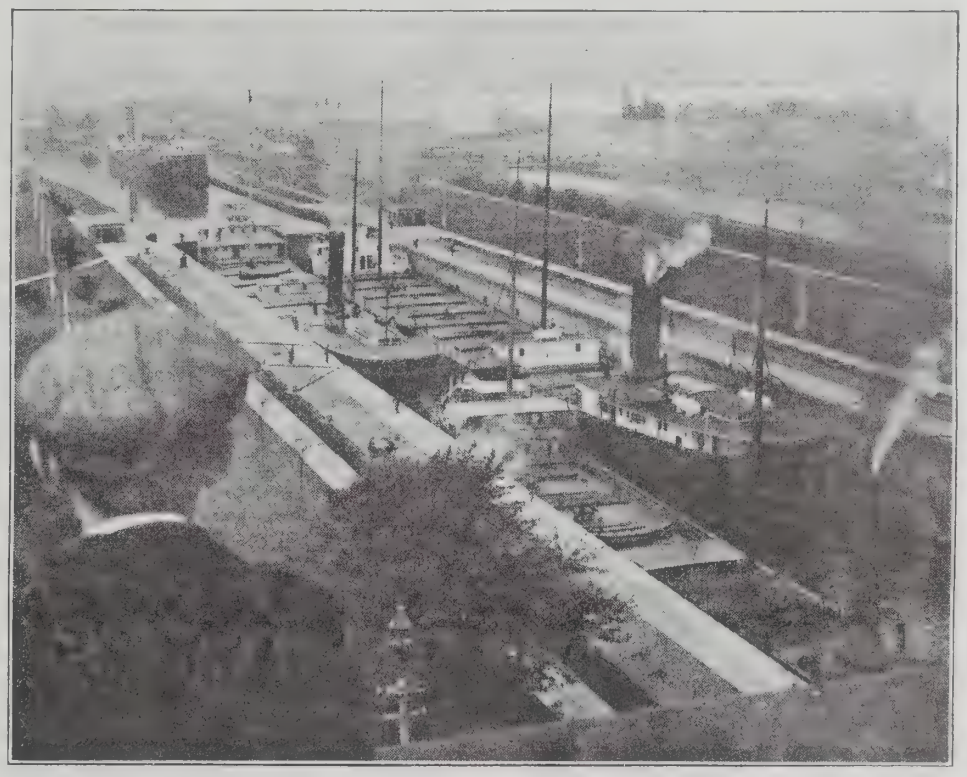
The railroads themselves recognize the absolute need of greater facilities and a number of high officials have endorsed the St. Lawrence seaway in public statements.

American and Canadian engineers declare that sale of the tremendous hydro-electric power developed at Cornwall would pay the entire cost of the project in a comparatively short time.

Under a plan being considered appropriations from the two governments would not be necessary. A financing corporation for each nation or perhaps a joint corporation would issue government-guaranteed bonds which would be sold to the extent of approximately $15,000,000 a year by each government. This would continue for nine years, the time required to complete the improvement.

The International Joint Commission has not reported on dividing the cost. It is assumed that it will be equally apportioned as to the enterprise and the 1,470,000 horse power development on the international section of the river. Power development on the Canadian side has not been taken up.

"Total traffic originating on Class I railroads in 1918," say the economists of the Great Lakes-St. Lawrence Tidewater Association, "amounted to 2,526,531,000 tons, or 24 tons per capita. On this basis total freight of the territory affected by the St. Lawrence seaway amounts to nearly 1,000,000,000 tons a year.



"The greater proportion is purely internal business not directed at seaboard, but there is a heavy foreign commerce as well as domestic commerce for points on or near the seaboard.

"On a basis of population, 28,000,000 tons of exports and 12,000,000 tons of imports originate in the tributary area, which embraces Illinois, Michigan, Wisconsin, Minnesota, Ohio, Indiana, Iowa, the Dakotas, Montana, Idaho, Wyoming, Colorado, Nebraska, Missouri and Kansas.

"Rail traffic in and out of Chicago alone totals 200,000,000 tons without duplication. In a year six of the principal eastern trunk lines carried 561,883,000 tons. The traffic moving to and from points on or near the Atlantic seaboard is estimated at about 250,000,000 tons. It is from this tonnage that the coastwise traffic of the St. Lawrence must be drawn."

To New England the hydro-electric power is the main attraction of the St. Lawrence seaway project. It means industrial expansion and more and cheaper goods for the western market through electrification of new factories and railroads.

With the St. Lawrence seaway opened, say the economists, the Central West would enter a period of unprecedented prosperity marked by tremendous industrial and agricultural expansion.

Soo Canal paid for itself five times in freight saving last season. Estimated grain direct from lake ports to Europe in large bottoms would save farmers of Central West at least $183,000,000 a year.

How Jews Ruled and Ruined Tammany Hall

An Original American Order, Steeped in Crime, Disgraced, by Yiddish Influences; Why Tammany Is No Longer Rebuked

WITHIN the memory even of young men, Tammany Hall has been the synonym of all political trickery, in the vocabulary of popular criticism. Tammany Hall was held up as the worst example of boss rule and political corruption that it was possible to find in either of the parties. Its very name became a stigma.

But even the most unobservant newspaper reader must have observed the gradual fading out of Tammany Hall from public comment, the cessation of the bitter criticism, the entire absence of headlines bristling with ugly charges, and the calling of the hosts of good citizenship to do battle against the grim bossism that maintained its headquarters at the Wigwam.

Why this change? Is it due to the dying out of Tammany Hall as a political force? No, Tammany is still there, as any New York politician will tell you. Is it due, then, to a reform of that organization? No, the Tammany Tiger has not changed its stripes. Then, perhaps, this change is due to public sentiment? Not at all. The explanation is to be found along other lines.

There was a time when fearless publications told the truth about Tammany, but *Harper's Weekly* and others which waged fierce war against the Tiger, have either gone out of existence or have fallen under control of the Jews. The silence which has shrouded certain matters must not be noted and set aside without reference to the changed control of the press. There was a time when public bodies like the Citizens' Union organized to oppose Tammany and to keep a volunteer vigil on its activities; these groups have succumbed to Jewish contributions and officership and no longer stand guard.

Why the Jews Coveted Tammany

THE outcry against Tammany seemed to be hushed the moment that Tammany patronage fell into the hands of New York Jews, where it now reposes, the Kehillah being the real political center, and Tammany but a distributing station—a sort of organizational "Gentile front" for the more powerful Kehillah. A few Tammany leaders are permitted to strut out in front, but everyone knows that from the Wigwam chiefs the power has departed, it is now to be found in Jewish conferences. Murphy is still the titular head of Tammany, but like a Samson shorn, he is not feared and obeyed as of yore. In fact, the Judaization of Tammany Hall is now complete. Once in a while the Irish—always a match for the Jews—rear their heads and show battle, but for the most part Jewish money rules and the Tiger lies down.

Tammany Hall was one of the strongest political organizations ever seen in the United States, potent not only in municipal and state politics, but often exercising a decisive influence on national affairs. It was, without exaggeration, *powerful.*

If there is one quality that attracts Jews, it is power. Wherever the seat of power may be, thither they swarm obsequiously. As Tammany was power and the gate of power it was natural that the Jews of the biggest Jewish city in the world should court it. Doubtless they were also affected by the incongruity of the fact that in the biggest Jewish city, the most solid political power was non-Jewish. That was a condition which called for correction.

The First Jew in the Wigwam

WHEN the German Jewish banker Schoenberg came to this country under the name of August Belmont to represent the interests of the Rothschilds, his keen eye at once took in the situation and at once he began to court the favor of Tammany. He became a member and a supporter. It was good business for this Jewish banker, because the funds of the Rothschilds were heavily invested in New York tractions. The properties of city tractions were and to a great extent still are, as in all American cities, at the mercy of the local Tammany power, by whatever name it may be known. Belmont was insinuating himself under the wing of power to protect the investments for which he was responsible.

August Belmont eventually attained the coveted eminence of Grand Sachem of the Tammany Society. The Belmont family for a time represented the sole Jewish banking support of Tammany Hall, but that honor is now divided among many.

In Richard Croker's day, when corruption went hand in hand with power, and power apparently was none the weaker for it, we find that this notorious leader's intimate friend, business partner and political associate was a Jew—Andrew Freedman. Freedman and Croker lived together at the Democratic Club in Fifth Avenue, Tammany politicians even then having become rich enough to despise Fourteenth avenue. Freedman held the purse strings of the organization, as head of the Committee on Finance, and he was Croker's representative and mouthpiece when the chief went into exile on an over-sea estate.

The most recent Jewish power in Tammany Hall, and one of the most liberal contributors to Tammany campaign funds, is the lawyer Samuel Untermeyer, whose specialty of recent years seems to be to serve as the battering ram of the Jewish power against interests which it wants destroyed, and whose efforts are usually camouflaged under exaggerated journalistic advertisements as being wholly in the public interest. Mr. Untermeyer is not in particularly good humor with Tammany these days, because of the recent defeat of his son, Irving Untermeyer, for a judgeship. There was somewhere a slip. The Jews deserted the Wilson ship anyway, apparently seeing what was coming in the way of retribution for the colossal and amazing mismanagement of war business which was principally in their hands; and in the ensuing mix-up, a scion of the house of Untermeyer tasted defeat.

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

Some Yiddish-Kehillah-Tammany Lights

TAMMANY numbers other Jews among its supporters. Nathan Straus, one of the owners of R. H. Macy & Company, has been for years an active member of the organization and one of the rulers of its inner councils.

A Jewish ghetto politician, Henry M. Goldfogle, has represented the Jewish interests in Congress for a number of years, and expected to continue, but he slipped in the election and has recently been "taken care of" by a city appointment.

There is also Judge Rosalsky who has been implicated in a number of interesting matters which illustrate the completeness of the Jewish network of control in New York City.

One might mention also M. L. Erlanger and Warley Platzek, justices of the supreme court of the state of New York, but if one began a list of the Jewish judiciary of that city, where would one end?

Another Tammanyite is Randolph Guggenheimer, founder of the corporation law firm of Guggenheimer, Untermeyer and Marshall—Untermeyer being the aforesaid grand inquisitor of Gentile activities generally, and Marshall being head of the American Jewish Committee and the Kehillah.

It was doubtless necessary for a Jewry that contemplated control of the judiciary as well as special protection for certain powerful Jewish enterprises that are near enough the borderline of the law to merit question—it was necessary to obtain control of the supreme political engine through which favors were disbursed in local politics. And control of such organizations can always be had by money.

Not that the Jews threw themselves entirely into Tammany. The Jew's natural political home seems to be in the Republican party, for thither he returns after venture elsewhere. But his predilection for the Republican party does not move the Jew to make the mistake of being exclusively the partisan of one group. It is better, as he knows, to control both groups.

As a matter of political fact, strong as is the Jewish element in Tammany, it is still stronger in the ranks of the Republican party, while New York Socialism is completely headed and manned by Jews. This renders it extremely easy for the Jews to swing support in whichever direction they choose, and for Kehillah to fulfill any threat it may make. It also insures that any Jewish candidate on any ticket will be elected. The fluke in the case of young Untermeyer is perhaps not to be entirely explained politically; other causes were doubtless working in that matter.

It is a long time since Ferdinand Levy bore the distinction of being the first Jew in New York to hold a political job. He was only a coroner, and the man who appointed him was only a fire commissioner, but that fire commissioner was Richard Croker. And Levy was solidly backed by the Independent Order of B'nai B'rith, whose success in this matter laid the foundation for more ambitious demands later.

Political Campaigns Are Mere Diversions

BUT at the beginning, the Kehillah Jews adopted the ancient policy, not of putting forward their own people, but non-Jews who could be useful to Judah. The difference between pro-Jewish politicians who are not themselves Jews, and politicians of the Jewish race, is that the former in office can sometimes go further than the Jew in office can, without detection. This has been true at least up to this time, but it will probably not be true very long, now that the people's eyes are being opened. The Jewish officeholder is only standing up for his race, but the "Gentile front" has betrayed the people for the pottage of Jewish favor.

Thus, in the early days of Tammany, indeed until comparatively recent years, we see the "Gentile front" in Tammany offices and basking in the glory of Tammany publicity, but in the background there is always his "Jewish control." This also is a formula for citizens who wish to know the meaning of things otherwise unexplainable—"look for the 'Jewish control.'"

To this end, therefore, the Jews have been strong in all parties, so that whichever way the election went, the Jews would win. In New York it is always the Jewish party that wins. The campaign is staged as an entertainment, a diversion for the people; they are permitted to think and act as if they were really making their own government, but it is always the Jews that win.

And if after having elected their man or a group, obedience is not rendered to the Jewish control, then you speedily hear of "scandals" and "investigations" and "impeachments," for the removal of the disobedient official. Usually a man with a "past" proves the most obedient instrument, but even a good man can often be tangled up in campaign practices that compromise him.

The Americans Roar When Told

IT HAS been commonly known that Jewish manipulation of campaign matters has been so skillfully handled, that no matter which candidate was elected, there was ready made a sufficient amount of evidence to discredit him in case his Jewish masters needed to discredit him. To arrange this is part of the thoroughness of Jewish control. And, of course, the American people have been sufficiently trained to roar against the public official immediately the first Jewish political hound emits its warning bay.

Amazing as is the technique of the Jewish political process, the readiness with which the American people can be counted on to do their part in forwarding the game is still more amazing.

What Mr. Hylan, the present mayor of New York has done to merit chastisement, is scarcely clear to a non-partisan investigator. But the fact that the Jews have set out to "get" him for something, is evident on every side.

In the Untermeyer so-called "housing investigation," the people hauled up were non-Jews, and the result of the whole business has been a stronger Jewish hold than ever on the housing affairs of New York. Jews are exempt from such inquisitions. The choice prey are non-Jewish business houses whose secrets may be forced and whose good name may be stained under cover of a legal procedure. There is such a thing as blackmail so entirely respectable as to be unsuspected.

Governor Sulzer, of New York, was the choice of the Jews. They subscribed money for his campaign,

forced it on him, and kept careful account of it. Finally, under pressure of a compelling sense of justice, Sulzer pardoned a non-Jewish valet of an important Jewish New York family, a young man whom a coterie of Jews very prominent in the political, financial and social worlds had contrived to "put away" for a period of 30 years. Sulzer had no option but to pardon young Brandt. But he paid the penalty. He was impeached. The Jews who supported him testified against him and their checks were used to assist his dismissal.

The story of young Brandt hangs heavily over the heads of some of the proudest Jewish names in New York.

Special Jewish Political Trickery

PLAYING on both sides of the political fence, and always retaining a string on the men they elect to office, are two Jewish characteristics which should not fail to be reckoned with. THE DEARBORN INDEPENDENT, in its recent articles showing the hand of Paul Warburg in the Federal Reserve System, was able to prove by Mr. Warburg's own words that his firm, Kuhn, Loeb & Company, during the three-cornered fight between Roosevelt, Taft and Wilson, supported all three. The Jewish owners of R. H. Macy & Company, New York, illustrate the same principle: while Nathan Straus looked after affairs at Tammany Hall, his brother and partner, Isador Straus, was one of the most active opponents of Tammany. Were the interests of the two men therefore different? Not at all.

Take the firm of Guggenheim, Untermeyer and Marshall. This is a notable firm for the part it plays in the people's business. Every community in America has been affected by Louis Marshall's decisions as head of the American Jewish Committee. Untermeyer is the arch-inquisitor for Jewry. Randolph Guggenheimer, the founder of the firm, achieved the foremost influence of any except the Chief in the old Wigwam, and was a power to be reckoned with in all matters. But Louis Marshall is a "staunch" Republican and a member of the Republican Club. Here again is the favorite method of including all parties under the capacious wing of the Jewish program.

Hence the popularity of "Fusion" in New York City elections. It has become the fad, but its most notable purpose is to insure the election of a Jew whatever his politics may be. In some Assembly Districts it is impossible to find anyone but a Jew to vote for. When Otto A. Rosalsky, a jurist who was implicated in the Brandt scandal, was re-elected Judge of General Sessions in 1920, he was the "Fusion" candidate on both the Democratic and Republican tickets. It was perhaps fortunate for his candidacy that he was. The point just now is that whenever a candidate may be vulnerable, it is very desirable to forestall a fight upon him by eliminating all opposition before the election. "Fusion" is another matter that should be carefully scrutinized in behalf of American rule of American cities.

By the way things are going in New York, these inter-party and "fusion" expedients may soon be unnecessary, because in any event it will be most difficult to avoid electing a Jew. Of the candidates of all parties for the offices of justice of the supreme court of New York, numbering 26, 14 were Jews. Of the Democratic presidential electors, 13 were Jews. Of the Republican presidential electors, 14 were Jews. Of the Socialist presidential electors, 22 were Jews.

"The Essex Market Court Gang"

THE strength of Tammany had exactly the same source as the strength of the Kehillah, namely, in the foreign population; the difference being that the Kehillah had a more compact foreign mass to draw upon. But both the Jewish leaders and the Tammany leaders have always been alertly aware of the fact that their power depended upon an uninterrupted flow of immigration, to supply the losses sustained by the Americanization of the people. It is always the un-Americanized foreigner that makes the best material for the Kehillah's and Tammany's purposes. The Kehillah is based upon the principle of recognizing racial minorities, and Tammany has made a specialty of giving representation of racial minorities in its councils. This was a liberal policy, and was thoroughly American in its original intent (as Tammany was a thoroughly American assemblage at its inception) but it was soon seized upon by the Jews and used to their own ends, and to the eventual ruin of all except Jewish representation. Thus all through the history of immigration activity, Tammany has been on the side of the wide open gate without any restrictions. The lower the type of immigrant, the more easily amenable it is to the ward boss's orders.

Tammany of recent years has been the able seconder of the Kehillah in all efforts to frustrate control of immigration.

The third great influx of immigration into the United States occurred in 1884 and was really the cause of the beginning of the degeneration of Tammany Hall. The great wave was composed of Russian, Austrian and Hungarian Jews, whose arrival was followed by a memorable period of crime, the marks of which remain to this day. Indeed, the downfall of Richard Croker was a direct result.

At that time the police department and the police courts before which all criminal cases in the city were first brought, were in the hands of Tammany Hall. The result was a partnership between local government and crime which has not been duplicated outside of Semitic countries.

Immigrant Jews of the shadier type organized an association called The Max Hochstim Association, which was known during the Lexow Investigation as "The Essex Market Court Gang." One of its chief rulers was Martin Engel, Tammany leader of the Eighth Assembly District. The "king" of this Jewish district was a man named Solomon who had changed his name to the less revealing one of "Smith," and who became known as "Silver Dollar Smith" because of the fact that he ruled his little empire from the Silver Dollar Saloon, which gained its name from the silver dollars that were cemented into the floor of his place of business. This saloon was just opposite the Essex Market Court, which was thronged daily by hordes of Yiddish criminals, the bondsmen, false witnesses and lawyers.

Where "Shyster" Lawyers Came From

LET not the fastidious reader deem it unnecessary to linger longer round the old police court at Essex Market, for out therefrom came a word which has fixed itself in common English speech—the term "shyster," by which a certain type of lawyer is described. A Clinton street lawyer named Scheuster, whose practices were quite characteristic, made himself very obnoxious to Justice Osborne. Whenever another Yiddish lawyer attempted a shady trick, the judge would openly denounce it as "Scheuster practice," and so it came that the first men in the profession to bear the name "shyster" were the Yiddish lawyers of Essex Market Court.

To make a nasty story brief, the Max Hochstim Association became the first organized White Slaver group in America, and the revelations made by the Lexow Committee are shuddering glimpses into that lowest form of depravity—a coolly conducted, commercialized, consolidated traffic in women. The traffic was made to yield dividends to politicians, to Tammany Jews in particular. The Ghetto became the Red Light District of New York. The first man to undertake the export trade in women with foreign countries, especially South America, was a man who later became a Tammany notable.

The surprising fact is that, although these matters are written in official documents, and although the same matters have been written into the record of every similar investigation which has been made, Jewish leaders persist in denying that the leaders in this particular form of depravity are Jews. When the United States Government made a nation-wide investigation, it found and recorded the same facts. The New York Kehillah came into existence as a defense organization at a time when the exposure of the Jewish White Slave traffic threatened to overwhelm the New York ghetto.

A Savory Organization and Its Work

THE Max Hochstim Association was not the only organization of its kind. The other was the New York Independent Benevolent Association, which was organized in 1896 by a party of Jewish white slave dealers as they were returning from the funeral of Sam Engel, brother of Martin Engel, Tammany leader of the red light district.

The gangs that formed the backbone of Tammany power in the slum districts were made up of "cadets." Their principal field of operation was the cheap dance halls. Paul Kelly's gang originated in the halls about lower Broadway. Monk Eastman's gang grew strong in the Russian Jewish District below Delancey street. And Kid Twist's gang developed close to a dance hall for Galician Jews on the far East Side. All of these three were Jewish gang leaders. They were slavers as their forbears were in the days of Rome's decline; they were bootleggers before the days of prohibition; and they constituted a strong support of the international narcotic ring which to this day has defied the law by corrupting the officers of the law.

It was to associations like these that the lights of Tammany lent their names. Tim Sullivan was a vice president of the Max Hochstim Association. The name of the Honorable Henry M. Goldfogle also appeared on the picnic announcements.

The exposure which resulted when the white people of New York finally succeeded in getting the forces of the law to function impartially for a little while, caused many of the implicated Jews to change their names. These names are now representative of some of the best Jewish families, whose concealed bar sinister is the fact that the foundation of the family fortune was laid in the red light district. Society, sliced down to its seeds, is a queer growth.

Tim Sullivan—an Irish-Yiddish Tragedy

IT IS due in justice to say that men like Tim Sullivan were not the originators of the Jewish abuses referred to, nor willing participants in the gains therefrom. Tammany would do favors for its friends, at the police court or elsewhere; Tammany had its occasional political upheavals; Tammany believed that they who profited by political spoils should divide with the Wigwam's treasury; but with such traffic as seduction and barter in women, Tammany had never been compromised until the Yiddish invasion of New York and the Judaization of the Wigwam. This much must be said for the Irish and American leaders.

The situation is the same in Boston. An Irish city, its chief political control is in the hands of Jews. The old-time Irish leaders are still permitted to be out in front, but the inner power has departed from them. One Boston ward, where once none but Irish lived, now contains only Jews, but the old-time Irish boss retains his seat. This is by favor of the Jews and nothing else.

The same state of facts accounts in large degree for the connection between a man like Tim Sullivan and the Jews. "Tim," as everyone knew him, was leader of a district inhabited by Irish and Germans. Then the Jews came in. And then began the Jews' practice of profiting by the people's dislike of them.

Foreign Jews well know that they are disliked. It is one of their assets which never fails to produce dividends. They choose the part of the city where they desire to live, and a few move in. Their immediate neighbors move out. More Jews move in—more of the others move out. The property nearest the Jews always goes down in value. People will sell at a loss rather than live engulfed in a ghetto.

Jewish Supersaturation of East Side

IT WAS so in Tim Sullivan's district. As the Jews swarmed in, the Irish and Germans fled north. Sullivan stood his ground. It was his old territory, he would not leave it, nor remove his family. He cultivated the new arrivals and made a partnership with the ex-kosher chicken butcher, Martin Engel.

The Jews lived under Sullivan's rule for a time, awaiting the moment when they should know what to do for themselves. The Yiddish flood increased until the district was crowded, and then the Jews demanded representation for themselves. With a premonition that a new force had arisen, Tim Sullivan played safe and helped the Jews to get recognition—Martin Engel was made leader of the old Eighth. But Sullivan had previously gone to Tammany—or to what remained of the old non-Jewish Tammany—and exacted an understanding that his rule should be left unchanged below Fourteenth street.

From that time forward, in spite of the understanding, Sullivan's power began to wane, principally because he continued to get in deeper and deeper with the Jews. He went into Jewish lines of business. He formed a theatrical partnership wih George Kraus, among his enterprises being the Imperial Music Hall, the Dewey Theater, and the traveling Eagle Burlesque Company. Still the old district continued to become crowded and overcrowded and saturated with Yiddish newcomers, for whom neither the name Sullivan nor the traditions of the district had any meaning.

In his closing years, scarcely more than a hanger-on around the former scene of his power, Tim Sullivan bitterly lamented the ease with which he was led into associations that undermined his power.

Croker was destroyed in public confidence by the terrific shock of the exposures attending the Jewish "cadet" activities. Sullivan, equally picturesque, was the slowly shoved-out victim of Jewish infiltration. There were other occurrences and other downfalls, all of which are a part of the real story of Tammany.

The Mortgage on the United States

(Concluded from page 6)

pelled to contract large debts. The southern states were almost unanimously opposed to Hamilton's refunding scheme. They were brought over finally by a trick of jobbery—in cold truth, they were bribed. By means of a deal made through Jefferson the city of Washington was established on the banks of the Potomac in return for sufficient Congressional votes from southern members to insure the adoption of Hamilton's scheme of national finance.

Hence the recognition of the beginnings of our national debt as we now know it was characterized by one of the boldest bits of political jobbery known to the annals of politics. And the city of Washington, D. C., is its enduring memorial.

In connection with this bit of history, it may be well to note that Hamilton is commonly misquoted regarding his view of a national debt's worth. He did not say that a "national debt is a national blessing" but that *a well-distributed national debt might be a national blessing.* Hamilton was no more insistent on the national credit being sustained via the national debt than he was on the necessity of that debt being reduced "as fast as shall be practicable, consistently with integrity and good faith." He recognized the dangerous fact that the "vicissitudes of nations beget a perpetual tendency to the accumulation of debt."

Since it was originated this country's policy toward the national debt has aimed at steady reduction and quick elimination.

Debt Paid and Money in Treasury

THE gross debt on December 15, 1815, was $133,403,476. That included the cost of the war of 1812, which was financed almost wholly on a basis of credit. It included also the $15,000,000 paid France for the Louisiana Territory and some parts of the cost of the war with the Barbary pirates and also of the near-war with France in the last days of the eighteenth century.

But as shortly thereafter as the seventh of December, 1836, the President announced to Congress that "all the remains of the public debt have been redeemed or money has been provided for this purpose whenever the creditors choose to receive it." Not only had the national debt been paid, but there was a surplus of $19,000,000 in the Treasury—a very large sum for those days.

The surplus was distributed among the states, which were then participating in the great campaigns of public improvement precipitated by the advent of the steam railroad. It is hardly pertinent to this narrative, but it is worth while to note here a curious sequel. About 1840 a number of the states on the verge of substantial bankruptcy came forward and asked the Federal Government again to assume their debts. After long debate Congress refused—and thus established a precedent that may account for the subsequent caution exercised with regard to debts by the states. In 1900 with twice as many states and several times the population and wealth the state governments owed only about as much as they did in 1840, but there has been rapid increase during the last 20 years.

After 1835 the highest figures reached by the national debt before the 60's were $65,304,796, which included a large part of the Mexican War's cost, and which had been reduced to about $60,000,000 when the Civil War began.

The financing of the Civil War included a repetition on a reduced scale of many of the evils attending the financing of the Revolutionary War.

The crux of the Civil War scheme was paper money, known as "Greenbacks," being, legally, non-interest bearing Treasury notes. As during the Revolution, they for a time kept on a par with coin; then they went to a premium which varied with the fortunes of the war and the changing outlooks for the Union's survival. At one time it took 285 cents of "Greenback" money to buy 100 cents of specie, or real money.

The story of advancing prices, due to inflation and depreciation, is an old one but *the vast increase in the "cost of the war," thus caused,* is not so well known.

H. C. Adams, whose work on "The Public Debt" is the accepted authority, calculated that *extra cost* to have been $850,000,000, or about one-fourth the total cost of the entire war.

That extra cost was brought about in this way: The government issued the "Greenbacks" and then accepted them in payment for bonds whose interest and principal were to be paid in gold. Thus all the government got, say, for a $100 loan was the gold value of $100 in "Greenbacks." If "Greenbacks" were worth, say, only one-half as much as gold, the government would get in fact only $50 for a $100-bond. In that manner the most outrageous premiums were paid on government purchases, and posterity was loaded with a war debt that in large part was "water" and nothing else.

"In the third quarter of 1863," says Horace White, "the government made an average loss of 10 per cent in its purchases and *this loss rose to 68 per cent* at the end of 1864. In 1865 the government was paying with currency worth 75 cents on the dollar debts contracted when it was worth only 40 to 50 cents a dollar, and after 1879 it paid 100 cents on the bonds sold at various rates of discount."

In April, 1865, the gold value of a month's pay of a private soldier was only $10.70, instead of the $16 which the government was supposed to be paying. Worse still, the commodity value of the soldier's monthly pay was only $7.69; in July, 1864, its commodity value was only $6.19.

Thus, instead of financing the war "out of the air" as Salmon P. Chase, Secretary of the Treasury, seems to have intended, the policy he adopted ended in "selling bonds at 40 cents on the dollar in a roundabout way, and cheating creditors and laboring men out of more than half their dues in an incidental way."

It also resulted in passing on to posterity a burden several times greater than the actual commodity cost of the war. Most interest on and principal of the Civil War debt was paid finally with farm products and labor and manufactured goods on prices only one-third to one-half those prevailing when the government was spending most of the money thus refunded.

It is only just to state that with Civil War financing Abraham Lincoln had little to do. The realm of money was not his forte and he left it to "financiers" who were considered capable. Finally, Jay Cooke, a Wall Street operator, had to be made financial agent of the government, to get any adequate amount of funds.

Chase, who fixed the policies that governed, in later years, as Chief Justice of the United States Supreme Court, held the crux of those policies—the "Greenbacks"—to be illegal and unconstitutional.

The national debt at the close of the Civil War was $2,844,649,626. It was not until 1879 that the credit of the government reached as low as a four per cent basis. At the height of the war, in 1864, the government had to pay as high as 15½ per cent for money.

Though, in line with the nation's policy from the beginning, the debt was steadily reduced; nearly two billions of the debt remained unpaid in 1880 and nearly a billion, or about one-third, of it was still unpaid in 1890. When the World War began we still owed about a half billion of the Civil War debt, but for several years there had been no attempt to reduce it. The reason was that it and other remnants of the national debt took care of themselves as security for national bank currency.

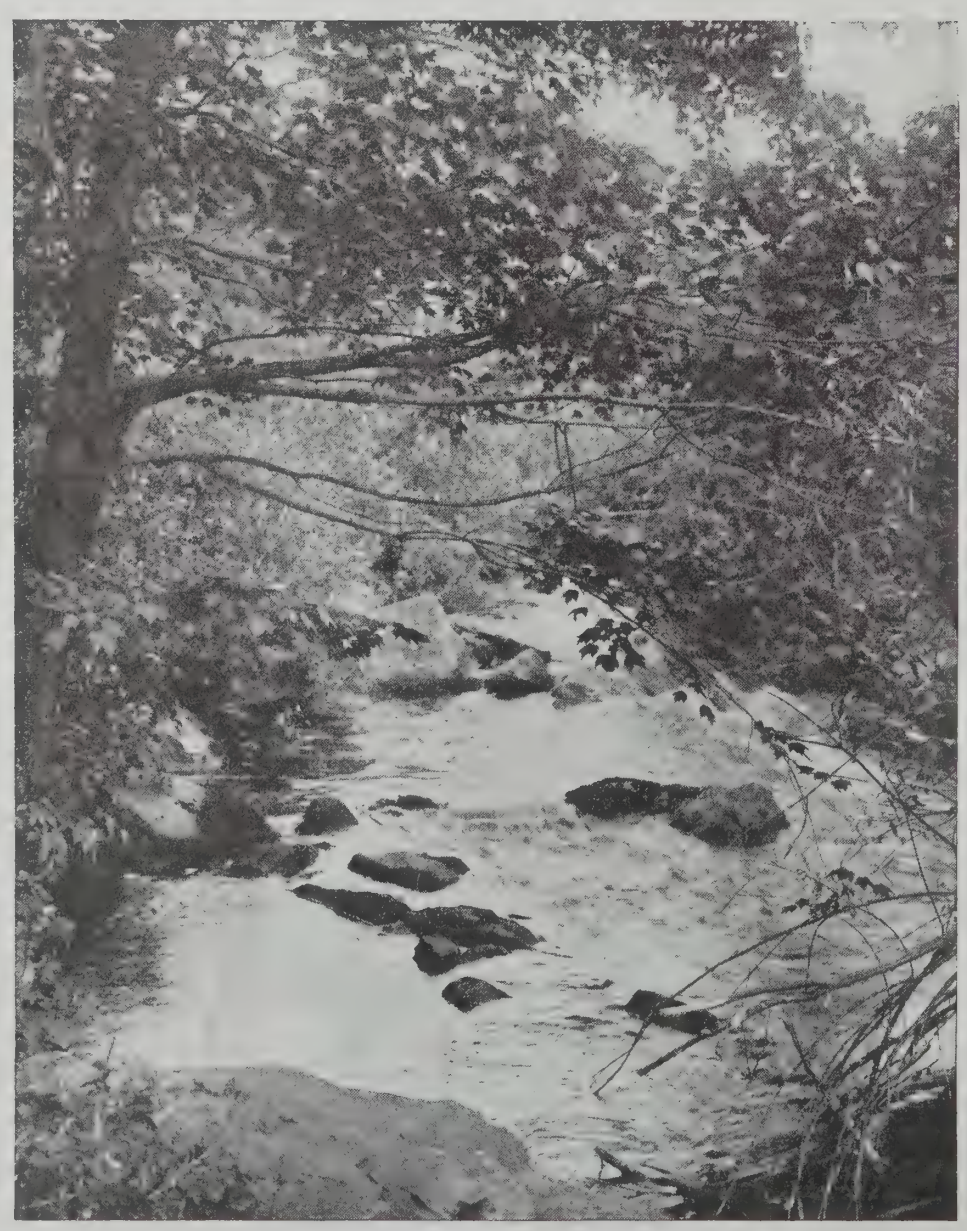
Interest paid on the Civil War debt during the 35 years, or the period of about one generation between the close of the Civil War in 1865, and 1900, aggregated about $2,500,000,000—or almost as much as the principal of the debt itself.

Who got the money?

That question cannot be answered in specific terms. If it could be answered it would be easy to say who will get the perhaps eight times as much as that which the government now proposes to distribute during the next 25 or 30 years on the score of the World War debt.

Many Bonds Held by Foreigners

IN 1803 there were 14,236 holders of Federal Government bonds. Seventy years later, or 10 years after the Civil War, there were 73,114 registered holders of government bonds. In 1880 a total of $825,917,150 worth of bonds was registered in the names of 80,802 individuals and corporations. This was $10,221 per capita of registrants. A little more than $1,000,000,000 additional bonds were then outstanding, mainly in coupon form. Of the ownership of coupon bonds no record is kept. *In 1880, $220,000,000 worth of our national debt was held abroad.* In 1880, 36 per cent of all the national debt was held by persons living in the New England states.



There is perhaps no greater fallacy than that a national debt is "taking money from one pocket and putting it into another." This could be true only if all of a nation's bonds were held by its resident citizens. Then the nation's goods, securities or gold would not have to be shipped to foreign lands to meet principal and interest. But even if all the bonds are retained in the country they are never at any time equitably distributed.

Most of the Civil War bonds, like the Liberty bonds, were sold "popularly." That is, in the beginning they had wide distribution, but that distribution was never equitable and as time passed it became more and more confined to a comparatively few persons. The bulk of the interest on Civil War bonds and virtually all of the principal were paid by the great body of the people to non-producing "coupon clippers." When we entered the World War it was estimated that there were not more than 300,000 bondholders of all kinds in the United States. Eighty per cent of our government bonds, totaling about $1,000,000,000 in value, were owned by the national banks.

How the Liberty bonds likewise are drifting, perhaps even rushing, into the hands of "coupon clippers," the effect on national economy of the resulting vast tying up of capital that might be productive, its tendency to increase the "leisure class," and other interesting things appropos to the national debt as it now exists, is another story. Suffice it for now to quote words uttered during the World War by Roy G. Blakely, professor of economy in the University of Minnesota:

"While it is impossible for this nation to shift part of the burden (of war) to the future, *it is possible for certain individuals and classes to shift parts of their shares on to other individuals or classes,* both now and in the future."

There is much evidence indicating that he was right.

Nation's Dry Laws Do Not Make a Drouth

A Moonshine Excursion Discloses That Bootleggers Bring Millions of Gallons of Liquor to the United States Monthly

By R. F. CHARLES

"MAKE the United States dry in 10 years," was the slogan adopted at the opening session of the W. C. T. U. forty-eighth annual convention, which recently convened in San Francisco. In the words of Mrs. Anna Gordon, national president of the W. C. T. U., "Prohibition has failed to achieve its object and the women of the W. C. T. U. are going to get back of it and put it over. We are carrying on a campaign against alcohol and nothing but alcohol."

Within the last few months a large proportion of the daily press of the country has prominently featured flagrant violations of the Volstead Act. These violations are prevalent practically all along the Atlantic coast and the Canadian border. Detroit is one of the main gateways through which Canadian liquor is entering the United States. Until a few months ago New York City was so unaffected by the Eighteenth Amendment that hard liquor in any combination and quantity could be obtained "for a price" quite openly and without trouble in any of the thousands of saloons which are still operating there in the guise of "soft drink" and eating places. The limited personnel of the Federal dry law enforcement office was utterly unable to cope with the situation, and it was not until after the New York police department was instructed to take an active part in the enforcement of the prohibition act, that an effort was made by the wet fraternity to make at least a show of observing the law.

Most of the Stuff Is Doctored

THIS ostensible obedience to the law has, however, had the effect of considerably increasing the wet undercurrent which runs the length and breadth of Manhattan Island and seeks an outlet wherever a weak spot appears. Any one who wants a drink of whisky, gin or real beer in New York can get it without difficulty, if he has the price to pay for it. And, according to last reports, the prices are 25 cents for a "stein" of nine per cent beer and anywhere from 40 to 75 cents for a good-sized drink of whisky of varying degree of quality.

Much of the stuff that is offered as whisky and consumed in staggering quantities by New York's native and visiting wets is of inferior quality and generally doctored. Bottled-in-bond whisky is scarce. Scotch whiskies command a high price, frequently selling for $25 to $30 a bottle.

The remarkable fact is that a large number of men in New York and other large cities will pay fancy prices for liquor. These men are largely responsible for the ridicule with which the Eighteenth Amendment is generally regarded by visiting foreigners and a fragment of our own population, which may be regarded as "the entrenched army of wets."

It is hardly to be wondered at, therefore, to note the strong language used by Roy A. Haynes, on the occasion of his assuming charge recently of the office of Federal Prohibition Commissioner. Said Mr. Haynes:

"To wink at the breaking of one law and preach the observance of another is unpatriotic and un-American. On that basis I believe former so-called liberals will as vigorously aid in the enforcement of the dry laws as those who have always been dry. Any other policy toward law in general means chaos—means Bolshevism.

"I am a newspaperman by profession. I have full knowledge of the power of the press. I appeal especially to the editor, the editorial and news writers, to the cartoonist, to the reporter, to the scenario writer and the playwright to lend every aid to the dry law enforcement."

Such an appeal is of necessity an admission of failure to enforce the Eighteenth Amendment. And, according to Wayne B. Wheeler, general counsel and directing genius of the Anti-Saloon League, "as long as one portion of our citizens is making, selling, transporting, buying or giving away liquor, and the other portion is looking on with inactive antipathy, the problem of enforcement will remain unsolved."

Huge Bootlegging Traffic

ACCORDING to statistics supplied by the United States customs authorities, international bootleggers get into the United States about 9,000,000 gallons of liquor a month. Whisky smugglers, attempting to enter the country by land and sea are constantly matching wits with Federal and state guards on the Atlantic coast and the Canadian and Mexican borders. Raids, seizures and arrests are daily occurrences. Courts are imposing heavy fines and even jail sentences to those convicted of violating the Eighteenth Amendment.

Prohibition Commissioner Haynes believes that the activities of bootleggers are being curtailed. Officials are making it more and more difficult to obtain liquor from bonded warehouses under the much abused permit system. The failure of this system is evidenced by the fact that 10,000,000 gallons of liquor found its way into the hands of bootleggers last year.

Approximately $500,000,000 a year is now going into the pockets of bootleggers, who supply whisky, beer and other anti-Volstead potions to thirsty citizens in violation of law, Federal authorities estimate. Between 35,000,000 and 60,000,000 quarts of hard liquors a year are now passing through the underground channels of the United States, government data indicate.

Liquors seized from international bootleggers amount to but one-tenth of the amount which originates in the United States, Chief Ashworth, of the United States Customs Service, estimates. From the same source the following illuminating figures are obtained:

In 1920 the imbibing portion of the American people consumed 41,000,000 proof gallons of distilled spirits. This amount does not include the untold and uncounted gallons of home brew and various and sundry liquors intoxicating to a more or less degree, that were brewed, distilled and concocted at home or made and peddled by bootleggers.

There is left in officially bonded warehouses something like 60,000,000 proof gallons, and spirits are still being made under government sanction by three distilleries, while scores of others are making alcohol for non-beverage purposes. Whisky, wines, gin, brandy and other alcoholic beverages are stored in 378 warehouses, scattered all over the country, many of them, according to official statement, without adequate protection.

As a matter of fact, investigations which have been conducted by Federal agents for months in New York, Philadelphia, Baltimore, Cleveland and Chicago, have recently resulted in the startling revelation that with the connivance of dishonest officials, millions of gallons of liquor have been removed from government bonded warehouses in the cities named, on permits obtained by bootleggers through bribing and corrupting of public officials to the extent of millions of dollars.

Such permits for the removal of specified quantities of liquor are supposed to be issued only to reliable firms, after conclusive proof has been submitted that the spirits thus removed are to be used specifically only for medicinal or other legitimate and non-beverage purposes. Yet the disclosures prove that permits have been issued promiscuously to one-stand, fly-by-night establishments, whose enterprising promoters and backers reaped untold fortunes through the extensive trafficking in large quantities of intoxicating spirits, illegally obtained.

But by far the largest supply of spirits for the consumption of the thirsty element of our population to whom the Eighteenth Amendment means little more than a law that was made to be broken, comes from the home-made stills that have sprung up all over the country.

Detroit an Active Center

PEOPLE who ordinarily would not think of breaking any law intentionally, who are respected and important factors in their respective communities, have no scruples about making, consuming and offering to their friends home-made beer and wine.

Detroit, a cosmopolitan city, has been one of the most active centers of the so-called booze ring activities. Her foreign element is large and her laboring classes legion and well-paid. Against the coming of the dry spell, as it were, some of her people laid in wet supplies. But thousands, notably the working classes, and these embrace practically all the foreign elements, did not. Either they hadn't the money to spare, or they were not convinced that prohibition was a reality.

As in every other large city in the land, liquor in one form or another can be purchased almost anywhere in Detroit. This is not successfully denied. Any citizen, anywhere, with the price can prove it. Those who think wet, say that this proves that prohibition doesn't prohibit. Those who think dry say that it will, and that price is the barometer. If the latter contention is correct, the dry thought is the right thought, because the barometer in going up, despite the fact that huge quantities of whisky and beer have been sent from Canada across the Detroit and St. Clair rivers.

Detroit's long shore line offers easy crossing to illicit traffic. Under a recent ruling by Police Magistrate W. E. Gundy, of Windsor, Ontario, nine per cent beer and whisky may be legally manufactured in Canada for export to the United States or other foreign countries and is perfectly proper under the Ontario Temperance Act, which went into effect several months ago.

Unusual activities resulted in the wake of this decision. At the docks in Sandwich and Walkerville, Ontario, beer was and is still being handled by the truck load. Shipments of whisky are made from Walkerville in wholesale quantities. Hundreds of high-powered motor boats, so heavily laden with beer and whisky that their gunwales were washed by water, sped across the river to unload their cargoes at Ecorse and other down-river towns. Speedy and commodious trucks awaited their arrival. The transfer of cargo was quickly made by experienced handlers and the trucks started on their way, creaking under the heavy wet loads, to their various destinations.

Canadian authorities contend that they are powerless to prevent this flow of liquor into the United States, claiming that it is up to that country to enforce its own laws. As the manufacture of beer and whisky is permitted under the Canadian court decision, Canadian customs officials said they could not refuse to issue clearance papers to any shipper applying for them.

Charles P. Campau, chief inspector of public safety, declared that Ecorse is the center of the traffic in illicit liquor brought across the border. Colonel Roy C. Vandercook, commander of the Michigan state troopers, placed more than 100 of his men at the disposal of those charged with the enforcement of the prohibition act, and, in a measure, the flood at that point was checked, temporarily, at least.

A recent decision by Federal Judge Arthur J. Tuttle, of Detroit, to the effect that United States customs officials cannot interfere with liquor shipments made from Canada in transit through the United States to foreign countries, loosened a veritable flood of liquor. Shipments aggregating more than $1,000,000 have already been made and orders for many millions more are awaiting shipment.

Such a tremendous influx of liquor, even in transit and under seal, is bound to leave a wet trail in its path. Consequently Detroit is getting its share of the wet avalanche. And bootleggers and their agents are so thoroughly organized that prohibition enforcement officials find it increasingly difficult to stem the wet tide that is deluging the city.

On the day Canada opened the flood gates 226 men were arraigned for drunkenness in recorder's court in Detroit, breaking all records for drunkenness since prohibition went into effect. Every culprit arraigned declined, of course, to divulge where he obtained his supply of the intoxicants, but officers who took them into court declared that the Canadian liquor influx and not home brew was responsible for this wave of insobriety.

Doctors Object to Being Bartenders

WHILE the Detroit police department is maintaining a "moonshine" squad whose work of ferreting out violators of the prohibition act and taking them into court, together with the evidence, is keeping them busy, recent decisions, handed down by various state courts, are discouraging these police activities.

At a recent meeting of the American Medical Society measures for adoption of legislation were discussed with a view toward ending the extensive practice of "making bartenders out of doctors."

While some states have already adopted and are enforcing legislation which prohibits the issuance of a physician's prescription for *spiritus frumenti*, commonly known as whisky, it is a common practice in many other parts of the country to use a conveniently located doctor as a means for quenching a thirst.

While a comparatively small number of physicians have encouraged this practice and in some cases got themselves into trouble through indiscriminate and promiscuous use of the special prescription blanks issued by the government for dispensation of liquor, the vast majority of the medical profession objects to this practice and is in favor of abolishing altogether the doctor's prerogative. As a matter of fact, it is generally believed among physicians that other non-alcoholic therapeutical agents are much more effective in certain ailments than whisky has ever been and the tendency among an ever-increasing number of physicians is to put "John Barleycorn" permanently on the black list.

So it appears that despite the countless private stills, the manifold home brews containing more or less "kick," the host of moonshiners, bootleggers and rum runners, those who have put prohibition into our Constitution will eventually succeed in making our country dry. Authorities everywhere agree that already much good has been accomplished by prohibition, and in this connection it may be of interest to scan the reports from various parts of the country which were received by the New York *World* to a recent query sent out in an effort to ascertain how prohibition has affected the community life of various cities.

Prohibition Reduces Crime

FROM San Francisco comes the report that crime has decreased and that home life is happier.

Crime condition in St. Paul has decreased 50 per cent.

Minneapolis reports a similar result.

Chicago has had an increase of crime, but attributes this to an influx of undesirables from other cities.

Pittsburgh has not experienced any material change, but reports that brawls and dissatisfaction among mill workers have materially decreased.

Seattle reports no material change.

Philadelphia reports a decrease in crime.

Boston, Portland, Maine, and Cincinnati report similarly.

Newark, New Jersey, reports crime less prevalent and vicious.

The police of Jacksonville report fewer arrests since prohibition went into effect.

There is no change in crime situation apparent in Milwaukee.

Other cities report similarly, and the New York *World* draws the conclusion that prohibition has lessened crime in the country and placed into many American homes many of the necessities and some of the luxuries of life which extensive use of beer and liquor formerly made impossible.

If prohibition, therefore, tends to make the world in general and our country in particular a better place to live in, it may be well for the average citizen to look at the Volstead Act with more than disinterested antipathy and to bear in mind what Mr. Haynes has said:

"To wink at the breaking of one law and preach the observance of another is unpatriotic and un-American."

Geology's Partnership With American Industry

Facts Gathered by Scientists Are Being Made Use of to Help Solve Problems of the Present Day

By GEORGE OTIS SMITH

Director of the U. S. Geological Survey

TWO tendencies in geologic work are noticeable today, and I believe that both are in the right direction. Geology is becoming more exact in method and result, and geology is becoming broader in outlook. Perhaps, indeed, I might shift these two statements on to a single track and say it all in a single phrase—our science is becoming more useful.

We dignify science—not degrade it—when we make it useful; we dignify it most when we realize its relation to human welfare. Geology is at its best when geologic facts are made to serve humanity by solving the broad problems of the best use of national resources of men and material.

I am glad that I have come to think of geology as a phase of citizenship rather than merely as a branch of science. A connection does exist between geology and public service, and there should be nothing to interfere with that connection; no bulkheads should stand between our science and our citizenship—between our scientific standards and our civic duties.

By his training the geologist is fitted to think clearly; by his experience he is fitted to act effectively. The geologist who is more than a "rock hound" or "outcrop chaser" is the one who can render the largest service. His unique qualification for public service is his sense of time. With his eye trained to see far back into the earth's remote past, he is better fitted to put correct values on the episodes of the brief present day in which we happen to live.

Intellectually, this longer view back into the past gives him poise; practically, this ability to see things in true perspective leads him to plan intelligently for the future.

The professional geologist is very much a modern product; indeed, it has been given to us of this generation to see geology establish itself as a partner of business. It was only in the early eighties, for instance, that geologic principles and methods were first applied in a professional way to the hunt for oil, and only in the last 20 years has oil geology become essential to the oil industry.

Geologists Are Now Consulted

SCIENCE and industry in their present-day progress are treading paths that converge, until they are now well within each other's sphere of influence. Science is becoming more useful, and industry is becoming more efficient, and this mutual approach means a mutual attraction. I may illustrate this by pointing to the gratifying tendency of up-to-date construction engineers to consult geologists on questions related to large engineering projects. To the trained geologist, familiar with the many kinds of rocks and their varied habits of assembling together, it has seemed strange indeed that so many engineers have gone ahead with great works of construction on the theory that rock is rock and that nothing can be learned of the third dimension of the earth's crust in advance of actual excavation. Possibly, however, some of this blame for their neglect of the geologist may be laid at our own door, for all of us do not seem to be firm believers in the practical value of our own science, and only in these later years have we learned to talk of the facts of geology with any approach to the quantitative exactness that the engineer requires.

Geology was never a closet science; its subject is this earth of ours, and its field is all out-of-doors. The horizon of the geologist is wide, and his contacts with life are many, so that geology has most naturally come into touch with human needs and by that association has become more and more practical.

That the geologist has won a high place in the world is gratifying, but that place carries a corresponding degree of responsibility. The two basic productive industries, agriculture and mining, have long been served by geology, and this close relationship was most keenly realized during the World War, when food and munition requirements demanded in turn new sources of fertilizers and other raw materials. Thrown as we were on our own resources as never before since colonial days, we had to recognize the geologist as a partner in our industrial expansion.

The raw materials problem was one we had to solve to meet the exigency, and now that the exigency is happily past we find ourselves studying our material resources with a new and broader outlook. A specialized type of geology is now demanded—the application of geology in terms of commerce; and to be most useful geology must occupy conjointly with industry the whole field of commerce, which is the whole world.

The raw materials issue will last through the centuries; but unlike the foodstuffs, whether corn or cattle or the fibers, whether cotton, wool, or pulp wood, the minerals, such as oil, coal, copper and iron, have but one crop to harvest. The duty laid on the geologist to discover every mineral deposit and to disclose its limits thus becomes more than a service rendered to his employer, the landowner or mine operator; it is a part of the national undertaking to determine the assets available for use by this and future generations.

We need to realize that American industry has reached the intensive stage. American business becomes more and more complex as by-products and side lines are added to industry and commerce. These additions are sure signs of economic progress, but this expansion necessitates the employment of specialists. The larger the business undertaking the greater its need of a staff of technical advisers who can see markets and supplies in terms of a generation rather than a fiscal year—men who can measure the unseen and weigh the undiscovered.

In planning for the future we must reckon with possibilities and probabilities. So it is that many corporations other than mining companies now employ geologists. Raw materials' specialists are employed to hunt for the needed supplies. Thus the geologist thinks of American industry as founded on stores of energy and of raw material, and he studies the geography of industry—its sites and its markets—in terms of adequacy and permanence of resources.

After our war experiences it was natural that the geologist should discuss the economic limits to domestic independence in minerals. There must be some economic limit to this possible self-sufficiency, even in a country as wealthy in raw materials as our own. With the question of adequate supply, which was uppermost during the war, is now joined the question of satisfactory price, which regains its old-time prominence with the return of competitive conditions.

Industrial expansion on the scale imposed on our country as its part in the war has cleared our judgment as to value in terms of utility. Gold was not one of the "war minerals" the increased output of which engaged the best efforts of geologist, metallurgist, and mine worker. Gold continues to hold its place as the universal measure of value, but gold is not a raw material whose general utility is at all comparable with that of its more democratic fellows like iron and copper. Indeed, there is some reason to liken this "noble metal," which has so long held the allegiance of mankind, to the idle aristocracy of Europe and to suggest that the more abundant the world's supply of gold the poorer off we are in the humble but useful things of life. It is a nation's output of coal and iron, petroleum and copper, sulphur and lead, cement and zinc, brick and aluminum that gives it power, rather than its output of gold and diamonds.

We need more interest in the science of geology itself—the interest not only of the public generally, but of those whose days are filled with effort to apply the science to immediate practical ends to make geology useful. Geologists have a large responsibility in conservation, and when I say conservation I have in mind not a sentimental theory, but the practical policy of use with full regard for future as well as present welfare.

The geological work of the Survey comprises all phases of geology, including stratigraphy, structure, petrology, paleontology, physiography, glaciology, metallography, mineralogy, chemistry and physics, as well as a census of the country's mineral resources. It includes also special investigations made for other departments of the government or for commissions, states, and municipalities. The results of nearly all these investigations are made public in printed reports. Especially gratifying has been the popular demand for maps and reports, many of which were out of print, and in recent years more reprints than usual of exhausted editions have been authorized to meet an insistent demand. The public is making use of the publications of the Geological Survey as never before.

A Census of Mineral Resources

NOT very long ago an inquiry was made as to what part of the Geological Survey's investigations concern the future. Every activity of the Survey is forward-looking: facts are being collected with which to guide present action and to plan for future action. This is true not only of a special investigation, like the superpower survey authorized about a year ago, but of the collection of stream-gauging records, the making of topographic maps, the study and the estimation of mineral resources and mineral production, and even the interpretation of geologic history. The Survey's function in the classification of the public lands is not simply co-operation with the General Land Office in the administration of the land laws; it is a co-operative effort to insure the best use of these lands, to plan their use so that the West may not have to pay the penalties attaching to an unwise disposition of the nation's real estate.

Forty years ago the first director of the Geological Survey outlined the future of the work and emphasized the relation of scientific research to the development of the country's national resources. In a period of rapid expansion and exploitation he gave warning that without adequate information in the possession of the government as to the needs of industry, without scientific knowledge of all the elements of national wealth, commerce is mere transportation, industry is short-lived, and an equilibrium of population with local resources is not to be attained.

Though for 40 years the Geological Survey's policy has been to contribute to the formation of a national plan, its own outstanding need today is a plan for itself—a program. It lacks that assurance of continued and adequate appropriations that would encourage or warrant long-term investigations, a few of which are absolutely essential in any forward-looking program of scientific research. The Geological Survey, therefore, is not fully occupying the field which is recognized as peculiarly its own. It could, however, occupy that field. The nation can well afford to invest in engineering data for future use. In a word, the Geological Survey, even though its shortcomings have been keenly realized from within, has not yet measured up to its task in the nation's business.

An item in the working program whose value was foreseen but whose adoption has not been possible is the mapping of geologic structures favorable to oil accumulation in the western states prior to the enactment of oil-leasing legislation. The need for such mapping was realized, for it would be helpful alike to the oil operator and to the government official administering the new law, but neither men nor money have been available to do more than touch the outer edges of this project. Similar preparation for the water-power law was obviously desirable but could be made only in part.

The examination of storage sites made in 1888-1891 was pioneer work that marked a beginning in the larger utilization of the water resources of the West, and it is unfortunate that this investigation was discontinued, for now authoritative information of this kind would be invaluable in planning the storage of flood waters for power and irrigation in the West and for power development, improvement of navigation, and flood protection in the East.

In fact, the Geological Survey has been unable to fulfill the requests made by the various Federal departments; and the appropriation has not been sufficient to meet the needs of the Survey for maps required for the investigation of the resources of the national domain. There are on file requests from the government, states and members of Congress for surveys in various parts of the United States, which would cost approximately $20,000,000 and which cannot now be considered.

A program for completing the topographic map of the United States has not yet been approved by Congress, though it promises to get results most expeditiously and economically. The data to be procured by such surveys are most needed for the development of our country.

Should Know America Better

IN MY Washington office hangs a large relief map of the United States. From daily glances at this map I learn the position of the earth features that have guided the growth of our country and even now exercise a large influence on our national progress. Most of us need to know our America better and to use every possible means of visualizing the comparative extent of its geographic units and their relation, one to another—the narrow Atlantic seaboard, the mountain barrier separating us easterners from the broad prairies, plains, and plateaus of the Mississippi basin—an empire in itself—and then the other and greater mountain mass, with its rich intermontane valleys and arid interior basin, and at the western edge of our map, the heavily forested slopes and fertile valleys of the Pacific Coast. All that is our country, and we need to have a clear vision of all that 3,000,000 square miles as we plan the location of our industries or survey our lines of transportation. In a nation's geography the whole is greater than any of its parts, and living as we do in a continent-wide country, our task is to see the nation's business on a continental scale.

The Geological Survey has just issued the first volume of a World Atlas of Commercial Geology, a work planned for the desk of the business man, as well as for that of the college student. This atlas exhibits graphically the distribution of mineral wealth over the entire surface of the earth, for one of the lessons we learned in the school of war was that it is not enough to know simply what America contains and possesses—we must know the mineral wealth of the world, exploited and unexploited, in all its continents and countries.

These facts, as disclosed in maps and texts, sustain in part the patriotic pride we feel in our national primacy in mineral wealth, but they also no less plainly appeal to our patriotic regard for the future continuance of our present prosperity. To be adequate, any stock taking we now attempt must include world resources and world needs and by balancing production against consumption must set forth a true picture of world competition, for under the complex requirements of present-day life no continent, not even North America, can be self-sustaining. It is not enough for us to make an inventory of the mineral wealth of the United States; we must supplement that inventory by a broad understanding of world demand and supply.

The practical value of this exhibit of the world's mineral assets is evident. Experience gained during the war emphasizes the advantage of an adequate supply of raw materials close at hand, yet that there are certain economic limits to domestic independence in raw materials is clearly shown by the readjustments already made. The more facts we possess bearing on the relative quantity and the relative availability of the mineral resources of our own and other countries the better able will be our captains of industry to decide whence they should derive their raw material.

The geologist's best contribution to industry is perhaps his advice regarding the future. Resources are expendable, but industry is long-lived. The geologist believes that he sees plain facts spread over the face of this old earth as through the pages of history, and he is keen to safeguard the future security of the American industrial program.

Marketing Live Stock Co-Operatively

Organization Owned and Controlled by 23,000 Farmers Has Eliminated Expensive Middlemen

By E. G. HERST

JUST how far farmers may go in the handling of their market live stock so that they may obtain the best returns, constitutes one of the greatest problems of producers today. The formation of co-operative live stock shipping associations has been a big step in the right direction, but aside from eliminating one middleman, the local buyer, they have accomplished little else.

In some sections federations of shipping associations have been formed through which practically all the co-operative and individual shipments of live stock of districts and even whole counties are marketed. This is another step forward in the field of more efficient marketing, but there still remains a huge gap between the farmer and the big buyers of his stock—the packers and the farmer buyers of stock and feeding animals, who, in so far as the producer is concerned, are the ultimate consumers.

That there is an absolute need for farmers to be represented on the terminal live stock markets is beginning to be conceded generally, although comparatively few producers realize fully the magnitude of the enormous business they are required to support and the many dishonest practices which they have been compelled to tolerate. On the Chicago market alone there are more than 500 speculators and about 100 privately-owned commission firms, all of whom are so thoroughly organized for their mutual protection that farmers are at their mercy absolutely as soon as their live stock is placed in the pens on the markets. At South St. Paul there are 34 commission and 54 speculative firms. Similar conditions prevail on every large terminal live stock market of the United States.

Of the two largest farmer-owned and co-operative live stock selling agencies operating on the principal terminal markets, the Equity Co-Operative Exchange at South St. Paul and Chicago is the largest and oldest in the Northwest states. In fact, it is the only live stock marketing organization owned and controlled solely by farmers on those two great markets at the present time.

Above—Equity Co-Operative Exchange in South St. Paul, Minn., which handled 3,383 cars of live stock in 1920. The exchange is owned and controlled by 23,000 farmers of the Northwest, who joined the organization to eliminate the middleman, to whom a large share of their profits was going.

The Equity Co-Operative Exchange had its inception back in 1908, when farmers of North Dakota, having become dissatisfied with the returns they were receiving for their wheat on the terminal grain markets, set about to form their own marketing machinery at Minneapolis, and later at St. Paul, to obtain a fair price. This they believed could be accomplished by the establishment of their own marketing agency, with an endeavor to deliver the grain to the millers and for export without the intervention of unnecessary middlemen. Despite opposition on all sides, this little farmer organization, after eight years of struggle and hard work against strongly organized interests, came into its own, and now is a prosperous and fast-growing marketing organization with a paid up capital of more than $1,560,000. It has 80 country elevators and one large terminal elevator at St. Paul, with a capacity of 550,000 bushels.

Having learned the value of co-operation in the marketing of grain without the intervention of a host of middlemen and speculators, farmer members of the Equity Co-Operative Exchange placed faith in the ability of their organization to serve them in the live stock trade as well. They saw no good reason why they could not sell their live stock through similar channels by establishing their own selling agency on the terminal market. Consequently plans were made, an organization perfected with an office, a sales force and an allotment of pens at the South St. Paul stock yards. October 1, 1916, marked the first business day of the organization on that market, and during the first month 107 cars of live stock were received, and during the second, November, the number was increased to 141.

Opposition was met, as was expected, from the commission men and speculators already established there. Drastic rules were drawn up by the Live Stock Exchange and heavy penalties were imposed on any of its members who dealt in any way whatsoever with the new farmer company. They were determined to smash the co-operative movement in its infancy, but the loyalty and determination of its members formed a bulwark that could not be broken down. The excellent service given in the sale of fat and stocker and feeder live stock, and, in the case of stockers and feeders especially, the savings made by only the one handling in the route from the producer to the farmer buyer, proved to its members and many others that co-operative marketing on the terminal market was possible as well as profitable.

The elevator owned by the exchange in St. Paul, which has a capacity of 550,000 bushels of grain. The exchange delivers grain direct to the millers.

In the brief period of its existence the Equity Co-Operative Exchange grew from the smallest to the next largest commission firm on the South St. Paul market. At its present rate of growth there is no question that this farmers' selling organization will be the leading firm at that point by the end of the current year. Following is a table showing the total number of cars received during the time of its operation on that market and the amounts of the gross sales made each year:

Year	Cars Rec'd.	Gross Sales
1916 (3 months)	320	$ 434,247.63
1917	1,585	2,868,896.14
1918	2,312	4,786,607.52
1919	2,309	5,089,816.12
1920	3,383	6,073,566.85
1921 (6 months)	1,704	2,339,145.87

It will be noted in the foregoing figures that the number of cars received in 1919 was slightly less than the number received in 1918. This was due to the Equity Co-Operative Exchange withdrawing its soliciting for live stock in North Dakota in that year, when the Equity Co-Operative packing plant opened at Fargo, with an understanding that all surplus which the plant could not handle would be shipped to the Equity Co-Operative Exchange at South St. Paul. The plant never had and does not now have any official or financial connection with the Equity Co-Operative Exchange.

It also will be noticed in the foregoing figures that this organization handled 1,704 cars at South St. Paul during the first six months of the present year. Compared to the first six months of 1920, when 1,295 cars were received, an increase of 409 cars, or more than 31 per cent, was made. The entire live stock receipts of the South St. Paul market decreased 15 per cent during this same period.

In August, 1918, the Equity Co-Operative Exchange opened its second branch on the Chicago market and since its beginning there it has shown a growth corresponding with the one at South St. Paul. During the first six months of the present year the business of the Chicago establishment showed a healthy increase of 54 per cent over the same period last year, while the entire receipts of the Chicago yards increased only about one per cent.

The governing body of this organization is a board of nine directors. These directors serve three years and three are elected by the stockholders at each annual meeting. Stockholders are entitled to only one vote, regardless of the number of shares held. Under the articles of incorporation and by-laws no one person can own more than 20 shares of capital stock. A shareholder owning but a single share has as much voice in a stockholders' meeting as one holding the maximum number. This control by farmers themselves makes the organization strictly and absolutely co-operative. Its stockholders control the business themselves through the wide distribution of its stock and the inability of any individual or group of individuals to get control. All the profits it earns are reserved for the producers, who make up its membership, and for its patrons. Those who furnish the business share the profits through patronage dividends. The organization is fully democratic in management, having initiative and recall and direct mandate in regard to policies or officers. A referendum or recall can be ordered by 25 per cent of the stockholders at any annual meeting.

The rapid growth of the Equity Co-Operative Exchange is proof that producers of live stock are fast learning to appreciate the value of co-operation in the selling of their products. However, much educational and promotional work is needed to teach farmers the benefits that are to be derived from co-operation and organization along that line.

Heretofore the farmers have been drilled and urged incessantly in better methods of production, with practically no effort made toward more efficient means of marketing what they produced. The wide margin that now exists between the buying price paid the producer and the selling price charged the consumer has awakened both classes to a realization of the big waste and inefficiency that exists in present marketing systems. To bring the consumer and the producer closer together has been the cry for a number of years, but it has only been in the last year or two that a nation-wide movement has been started toward this end.

It is the chief object of these co-operative marketing organizations to sell farm products at lower cost to consumers, and at the same time benefit the producers by paying them a higher price than they are now receiving for their products.

In the past two years farmers have lost heavily in not being able to get so much as the cost of production for their crops. What producers desire in the way of returns is the cost of production plus a reasonable profit.

That the Equity Co-Operative Exchange opens up trade channels that benefit the producer and consumer is shown by the loyal support of its 23,000 farmer-members and the recognition it has received from the American Farm Bureau Federation.

At a recent meeting of the Committee of 15 a report was adopted recommending farmer-owned co-operative commission companies on the terminal live stock markets. The report expresses the thought that existing producer-owned live stock commission companies are to form an integral part of a national marketing plan. With such assurance, little doubt remains that the Equity Co-Operative Exchange, the only co-operative live stock marketing agency on the Chicago and South St. Paul markets, and other existing real co-operative live stock commission companies on other markets will form the foundation on which to build a nation-wide farmer-owned marketing organization.

The Return of the Gladiators—A Meditation

The Second of the Series "Fighting the Devil in Modern Babylon"

By DR. JOHN R. STRATON

Pastor, Calvary Baptist Church, New York.

I ATTENDED the prize fight as the guest of one of the great newspaper syndicates to send out to its 600 papers a rebuke of the affair from the Christian standpoint, and to gather material for a sermon against it, in the fight that I have tried to wage against the devil in New York, modern Babylon. The event impressed me especially as an illustration of the fact that our moral progress seems completely to have stopped.

Victor Hugo once said, in his wonderfully eloquent way: "Progress is the stride of God." Through the inspiration of Christian ideals, we saw many magnificent strides forward in the moral progress of the race. Under the guidance of God, womanhood was freed, childhood was glorified, slavery was abolished, dueling was stopped, the Louisiana state lottery and other gambling were prohibited, and the bloody prize fight was outlawed in practically every American commonwealth.

But there were certain counter currents strongly operative which played on the inherent weakness of human nature, and these counter currents had begun to manifest themselves quite strongly even before the war. Then the war came along and knocked the props from beneath our moral idealism, and we shot down the broad way toward hell.

Every war, of necessity, is followed by a wave of immorality, for war is the supreme immorality. Naturally, therefore, the greatest war in the history of the race is now being followed by the widest wave of immorality that has ever swept the world. Only a silly and spurious optimism can deny the fact.

As a student of history, as well as an observer of contemporary thought and tendencies, I have been profoundly interested in watching the effect of this prize fight on the further development of our American life. We need to understand that such things as this prize fight do exert an enormous influence for the debauching of an entire people. Blood lust and the glorification of brute force feed on themselves, and if these tendencies, which are now triumphant in America, are allowed to continue unrebuked and unchecked, they will soon bring us back to the grossness of the Roman Empire at the time Christianity began to exert its beneficent influence.

The further these things go, the greater will be the tendency of the depraved taste of the easily moulded multitudes which follow after such things to demand something stiffer than a mere prize fight. Already, through the killings which have occurred, we are in sight of a return to an equivalent of the gladiatorial shows of Rome, in which human beings were murdered as a pastime for the multitudes.

Not only will our men be debauched, but our women also, as is clearly indicated by the attendance of more than 5,000 women at the recent fight. Our society belles of that coming day—the descendants of the "smart set" of today, who attended the Dempsey-Carpentier meet—shorn of all womanly delicacy and gentleness, will gloat with their male consorts in the fever of the blood lust, and they will turn down their jeweled thumbs as a sign that the defeated gladiators in the arena before them must die!

Such things as the return of the Roman Arena are not at all impossible for the near future in our country. Historians tell us that when the gladiatorial combats first started in Rome, they were comparatively mild affairs, with dummy weapons and two or three pairs of gladiators furnishing the entertainment for the day. But by the time of Julius Caesar much larger numbers were being used, and they were fighting to the finish. Then, when the republic, with its more humane ideals, passed, and the empire, with its glorification of brute force, supplanted it, the passion for the arena steadily increased, and the battles became bloodier and more fatal. We learn from Horace and Persius that in their day 100 pairs of gladiators were the "fashionable number" for private entertainments. By the time of Titus, shows were in vogue which lasted 100 days, and Trajan, we are told, celebrated his triumph over Decebalus with an entertainment in which 5,000 pairs of gladiators fought. They had regular pitched battles in the arena, in which scores of men on either side fought to the death.

So degraded did these public exhibitions become that Domitian, at the Saturnalia of A. D. 90, arranged a battle between male dwarfs and women, and all are familiar with the terrible injustice and degeneracy that led to the revolt of the gladiators under the heroic leadership of the Thracian Spartacus.

The passion for play as an end in itself, the love of luxury, the glorification of brute force, the decay of the family and home ideals, neglect of the church and desecration of the Sabbath day, crowned by such things as this bloody prize fight and the insane movement for huge armaments, will finally lead us into a moral quagmire within another generation in America, unless these things are definitely checked and overthrown by a revival of real religion and a return to the old American ideals.

One cannot fail to fear for the influences of this degrading affair which we are considering upon the youth of our country. Not only did I notice gambling among small boys before the fight; and not only did I hear an excessive amount of shocking profanity and obscene language before, during and after the fight, but, while one of the preliminary bouts was in progress—a brutal and bloody fight between two men—little girls, mere children, passed through the crowd taking up a collection for a Jersey City Hospital!

And the motion pictures of this fight have been sent throughout the nation and around the world, to parade Dempsey before the eyes of our youth as a great hero!

Think of the influence which will be exerted on the standards of success of the growing generation by the strongly emphasized fact, in connection with these pictures, that Dempsey received $300,000 for that one fight! Three hundred thousand dollars for less than a half hour's brutal work, while the President of the United States receives only about the same amount in return for four years of arduous and wearing labor!

I wish that my readers might consider calmly the significance of the presence of large numbers of church men and women at that ring side. It illustrates the fact that multitudes of church people have surrendered completely to worldliness and self-indulgent pleasure.

The culmination of this whole disgraceful tendency has been reached in the attendance of a multitude of church women at the Dempsey-Carpentier mill. They deserve the sternest and most scathing rebuke. Think of women, whose influence is world-wide because of their wealth and position—women who belong to the church and who come to the communion table—think of such women, I say, sitting at a ring side watching and applauding two men pounding and bruising each other and struggling in sweat and blood until one was beaten down by the cunning and the sheer weight of the other!

Have these women, and the church men also, who attended this prize fight, forgotten their spiritual heredity, as well as their Christian ideals in the living present? The early Christians were often in the arenas of paganism and heathenism, but always as victims and never as witnesses of the brutality and butchery that made such a popular holiday!

To sum it all up, the outstanding impression that this fight and everything connected with it made on my mind, as already hinted, was that the whole thing was a glorification of the principles of paganism, which are utterly alien to the Christian ideals and the origin and genius of our noble land. Paganism is the exaltation of the flesh above the spirit, the supremacy of matter over mind. It is the apotheosis of the soulless and the sensuous, and its growth means the supplanting of Christian ideals by idolatry, the worship of mammon, the glorification of brute power, and the passion for "pleasure."

There is no magic in America to preserve us from the results of the sins and follies that have wrecked other great peoples before us. As I see these deadly forces that have destroyed every people of the past who have surrendered to them—as I now see these forces of worldliness and godlessness and sin menacing this beautiful America of ours with all her matchless promise and all her meaning to the world, and as I see already our boys and girls being swept down to destruction by these forces, I feel like crying out with old Jeremiah: "Oh that my head were waters and mine eyes a fountain of tears, that I might weep day and night for the slain of the daughter of my people!"

Most humbly and yet most earnestly I appeal to the people for a return to the realities of religion and the splendid strength of old-time Americanism. I appeal for a return to the old fashion. I appeal against all those who violate the Ten Commandments and despise the Sermon on the Mount. I appeal for a return to the stern and splendid ideals of true Americanism. I appeal for those simple and yet sublime forces which made our fathers great and our mothers good, which put service above self, manhood above money and God above gold—the forces which made duty instead of pleasure the real motive of life, which repudiated the Epicurean maxim, "Dum vivimus, vivamus," which, instead of the easy-going "eat, drink and be merry, for tomorrow we die," said rather, "Arise and stand upon your feet, gird on your armor, strive for the eternal right, and follow those sublime and heavenly ideals which constitute at last the true life of man!"

Mount Tacoma from Spanaway Lake near Tacoma.

Outlaws of the Animal Kingdom

By COURTENAY SAVAGE

SWIFT, lustful, relentless, are the outlaws of the animal kingdom, enemies of both man and beast, feared, hated—oftentimes with a price on their heads, as when an East Indian community offers a reward for the death of a man-killing tiger—or a Northern Michigan township sets a bounty for the destruction of timber wolves.

All animals, even the house dog and cat, are creatures of prey, but few animals are deliberate killers who attack for the sake of killing. When the ordinary creature of the forest kills it is because of hunger, while many of the greatest beasts do not kill for food, but get their nourishment by grazing along the grassy glades of the jungle. The deliberate man-killers are very few, most animals being afraid of man, escaping whenever possible. When cornered, however, nature has endowed the beasts with powerful weapons of defense, and a great intelligence as to how to use them.

And the killers are not limited to any division of the animal kingdom, the birds and the fishes both having members of the family that are destroyers.

There is the condor, for instance, a bird of prey belonging to the vulture family that makes its home on the mountain tops. The largest condors are found in the Andes of South America, but there are condors in the mountains of California—though not so huge as the South American birds. These birds probably have the keenest eyesight of all, and soaring 15,000 or 16,000 feet in the air they can discern an object of prey — and swoop mercilessly down. Condors have been frequently known to attack a horse, a cow, and all the smaller domestic animals, and while they gorge themselves, no bird could eat so much as the condor kills. They rarely attack a man—though several instances of such an attack have been recorded. The condor's chief fighting weapons are the tremendous talons with which they tear—the hooked beak, and the beating wings, which can deliver sledge-like blows. A full-grown condor will have a spread of wings measuring 10 or 12 feet—and their power can be imagined.

To a certain extent our great American eagles are killers, and so are the great hawks that will raid the unprotected chicken yard, and kill more than they can eat.

The wild elephant, when hunted and enraged, is, of course, a dangerous animal, but the elephant cannot be called a killer, for they are by nature a rather docile beast—easily tamed, and through certain sections of the Orient they are used as beasts of burden. The jungle lion is different. This greatest member of the cat family often kills for the joy of killing, lying in wait for the passing of an unsuspecting prey—a swift pounce, a savage, fear-rending roar, the lashing of a tufted tail—and the killing is done. In Africa, where this master of the jungle is very numerous, the government reports that in the past few years the number of lions has grown so that now they have again become a serious menace to the outlying farms and cattle ranches. Before the great war huntsmen from all over the world went to Africa, and all tried to kill at least one lion. The war stopped this hunting, and the lions have grown so bold that they raid the grazing fields of cattle.

Far more blood-thirsty than the lion, however, is the tiger, the striped death of the jungle, as the natives often call the beast. So lustful is the tiger, so feared, that among the natives of many Indian communities the animal is worshiped as a diety, and prayers are offered, imploring the tiger to keep away from the villages. These prayers, however, do not in any way hinder the hunting of the tiger, and the man who kills one is a local hero. More than one white man has owed his supremacy in a native community to his ability as a tiger hunter, and there is probably more superstition connected with the East Indian tiger than any other beast. Certainly the tiger has been the central character of hundreds of stories, and novels.

A full-grown tiger will often measure more than nine feet from the tip of the nose to the tip of the tail. Although a tropical animal, heat enrages the tiger, so that they make their homes in a well-watered country where there is plenty of food—deer, wild pigs, monkeys, and other small animals. The man-eating tigers are generally females.

Top, left Barbary Lion. Top, right—The tiger is probably the fiercest killer of all. Center, left—Fossa—one of the fiercest killers, found only on the island of Madagascar. Center, right—California condor or California vulture. Bottom—The killer whale, a giant porpoise that will attack any other fish or whale.

The wolf is perhaps the most common killer found in the United States, the long legs, lank body, bushy tail, and upright ears being a familiar forest sight in most of our northern states, where there are great unpopulated tracts.

A common killer, well known throughout the northern portion of the United States is the weasel. No poultry yard situated away from a town is apt to be safe from it.

An interesting tropical cousin of the weasel is the fossa. The fossa is found on the island of Madagascar, and in appearance is not a great deal unlike our American martens. Fully grown, the fossa measures close to five feet, two feet of this length being taken up by the tail. It is one of the fiercest, most destructive animals known.

Among the fishes, the shark has always been dreaded as a man-killer, and like the tiger, this creature of prey takes a yearly toll from the natives of the tropical islands. Sharks have been known to come as far north as the New England coast, and have entered the mouths of rivers to attack bathers. They prey on smaller fish for food, and for the sake of killing.

Far more of a sea tiger, however, is the giant porpoise that is commonly known as the killer whale. This killer is found in temperate and cold seas—as the Japan Sea, for instance, and is as swift as it is fierce, attacking anything that comes its way. The killer whale has been known to force open the jaws of the grey whale, and tear out its tongue. It attacks and kills seals and sea lions and has been known to try to break up, or overturn an ice floe, in an attempt to throw the young seals into the water. It will even attack the great sulphur bottom whales, and many of them caught show marks of mutilation, where the killer whale has bitten at their huge fins. Grey whales are much afraid of the killer, and more than one of them has gone around on the beach while hurrying from a persuing killer whale.

This giant porpoise, or killer whale, is about 12 or 14 feet in length, very swift in action, and peculiarly marked, almost as if it had been painted. The jaw is rather more pointed than the average whale, and the teeth are its cruel mode of destroying.

Of all the killers of the animal kingdom, however, the most feared, and perhaps the most deadly to mankind, is the snake family. Ever since the dawn of the human race the snake has been the symbol of fear and hatred. The ancient people worshiped the snake as a god of evil, and all through history the snake has typified evil. Christianity knows the snake as the enemy of mankind, as typified, for instance, in the story of Adam and Eve, and the apple. And the Old Testament curse, that the seed of the woman should bruise the serpent's head has come down through the ages. Certainly, there are few men and women who will not kill even inoffensive snakes.

The snakes that are dangerous to man are not limited to any portion of the globe, though the larger, and more deadly poisonous members of the family are found in tropical countries. The cobra is perhaps the most deadly snake, and the boa constrictor is equally savage, but their modes of attack differ. The cobra poisons with its fangs, while the boa constrictor swiftly coils its huge and powerful body about its victim, and crushes out life. Pythons are another member of the killer family that is not uncommon to the tropical jungle.

In our own country, and very generally found, are the poisonous adders, the rattlesnake that is found from north to south, the copperhead, and the water moccasin. The rattlesnake is probably the most common of all these, but fortunately the rattle gives warning of the reptile's presence. Copperheads, however, lurk in the rocks and strike without warning. All snakes, however, will do their best to escape. And, contrary to general belief, the bite of a rattler or one of the other poisonous snakes of the United States need not prove fatal.

BRIEFLY TOLD

Red snow is an added attraction to the wonders of Rocky Mountain Park in Colorado. Countless billions of tiny organisms that reproduce in the cold environment are responsible, according to government experts. The coloration is more intensive a quarter of an inch below the surface and streaks often red as blood have a sweetish taste. Scientists believe that the spores may have been brought down from the Arctic by the Chinook winds.

Canadian hemp, grown in the western provinces, has been successfully manufactured into practically anything from the coarsest rope to the finest linen. The hemp tested was grown at the Manitoba Agricultural College and it had laid under the snow all winter.

College courses on transportation are suggested by a prominent railroad operating official, who believes that the colleges might well turn their attention to the development of courses in railroading, treating it as a scientific study compared to medicine, engineering and law.

Diamond mine owners in the interior of Congo are planning airplane service 500 miles distant to reach a point which by existing water transport requires a month.

Honey bees guarding their honey, which a wind had scattered from a hollow tree across a road near Lexington, Kentucky, refused to abandon their property, and hovered in great numbers over the scene. All traffic was detoured until the honey was cleaned up by the bees.

Tarring and feathering were made legal penalties by Richard I, who ordained that "a robber who shall be convicted of theft shall have his head cropped and boiling pitch shall be poured thereon, and the feathers of a pillow shall be shaken out on him, so that he may be known, and at the first land at which the ship shall touch he shall be set on shore."

Steam shovels will begin demolishing the Cahokia Mounds near East St. Louis soon unless the state or some historical society purchases them. These relics are the last evidence of prehistoric Indian culture of the United States. There are 64 in number, the largest covering 16 acres.

A wireless-controlled automobile made several successful trips in tests at McCook Field.

Carusos lungs were so powerful that when a concert grand piano was pressed against his chest he moved it several inches by the expansion of his lungs.

The spreading of culture through the medium of personal contact rather than classroom work is the latest venture in education. The University of Michigan has obtained the services of a prominent poet to perform this service. If the experiment succeeds it will be repeated next year, a painter or sculptor being chosen.

Prohibition Creek is the name given to a tributary of the Mackenzie River by oil prospectors because it goes dry at its mouth on July 1 or thereabouts each year.

Kindling a fire by plunging a stick into water was the unusual experience of members of the National Geographic Society in Katmai National Monument, Alaska. Natural steam issuing from a vent in the earth's surface had a temperature of 645 degrees centigrade. A stick thrust into this steam burst into flame immediately.

No food will be taken by Stefansson on his rush to the South Pole.

Jumping into a partly filled silo instead of using a ladder caused the death of a farmer living in Nebraska. He was overcome by gas and died before rescuers arrived.

Chamiza sage brush may be used successfully as cattle feed, according to the announcement of the New Mexico Agricultural College. This is of great importance to ranchers of the Southwest as it has been found that cattle will live in drouth periods when fed only on the plant. It is found in the foothills but will be transplanted to the plains districts. It is not fattening but stock will survive if they eat nothing but chamiza which is hardy.

Carrier pigeons will be used for disseminating news of the convention of the United Mine Workers of America in Indianapolis, September 20. In this manner miners in the fields will be informed of the convention proceedings.

Snapshots of Mars, as if the planet were but a mile and a half away, are promised in 1924 by an American scientist, collaborating with a prominent American astronomer. Professor Todd, astronomer, has found a mine shaft at Chanaral, Chile, the shaft of which will be used as the barrel of the telescope. Mars will be at its zenith over this shaft several times in 1924.

More garages than dwellings were built during 1920 in the United States.

The intelligence of a setter dog saved a French alpinist from certain death when he fell over a precipice, breaking his legs. Unable to move he wrote a message to his wife and fastened it to the dog's collar. The dog rushed home and six hours later help arrived, the dog leading the way.

"Court convenes at 9:30." This sign, conspicuously posted on several streets leading into Quincy, Massachusetts, is the police chief's warning to motorists of the danger of fast driving.

Welding cables on bridges three hundred feet above the ground is the work of a Jersey City woman. She is the mother of two children and earns $30 a day at her work.

July, 1921, was the dryest July experienced in England for more than 100 years.

Chloroform sprayed from atomizers is the latest development in chicken stealing. Chicken thieves near Chicago spray the interior of the chicken coops with the anesthetic and then enter and collect the dazed fowls. By this means they are able to operate on a large scale undisturbed.

Corn that grew in Tennessee possibly before Joseph put away his seven years' supply in Egypt, was unearthed recently by the Bureau of American Ethnology in Davidson County. The corn was found in stone slab graves and is the same type of Indian corn that occurs in the West Indies which leads the scientists to believe there was a very early communication between the West Indies and North America.

The richest phosphate fields in the world are owned by the United States. A new process of mining and manufacturing drives off the phosphoric acid where it is concentrated, saving millions of tons of phosphates which were previously wasted.

Alligators are protected by Louisiana.

The daughter of Charles Dickens placed in the British Museum documents with the instruction that they were not to be opened until 1925. Lord Haig has filed comments in the museum labeled, "Not to be opened before 1940."

Living in a copper horse is one way three Germans of Coblenz solved their housing problem until the city authorities caught them at it. They gained entrance to the inside of the giant figure of a horse bearing the statue of William I, by discovering a loose copper plate on one side. They had installed a bed and laid in a supply of choice wines and provisions.

Gondolas for the Thames is the plan of a London builder, who is making a fleet from real Venetian models.

Auto tubes dropped from an airplane saved the lives of three young women who were struggling in the surf at Hampton Beach, New Hampshire. Life guards were beaten back in their efforts to reach the bathers when the aviator and his mechanic flew over them and dropped the inflated tubes within reach. They clung to the tubes until the guards reached them.

Old army forts of no historic value are to be sold by the War Department.

Hot water gushed from a well driven near Sebring, Florida, and is coming to the surface at the rate of 40 gallons a minute. The flow has maintained an even temperature of 130 degrees and shows no signs of abating. This is the second hot water well brought in in Florida, one having been drilled at Pensacola about 20 years ago. The first well ceased to flow when the drill broke through rock and diverted the water into a subterranean lake.

Why Does Johnny Quit School at Tender Age?

By UTHAI VINCENT WILCOX

JOHN JONES, JR., 15 years old, had somehow slipped by the doorkeeper and the eagle and argus-eyed secretaries into the private office of the president of the great railroad company.

It was springtime and the president, instead of being buried deeply in cost sheets, traffic problems, reports of vice presidents and efficiency experts, had his feet on the polished table about which the solemn-visaged board of directors met, and was dozing while the balmy spring zephyrs played with his iron gray locks.

Johnny Jones, Jr., opened his mouth and started to speak, but hesitated. A smile crept from the corners of his mouth to his ears, and radiated to his eyes.

He looked steadily at the colossus of industry, then on tiptoe looked toward the door. But the genius who made nearly double the salary of the President of the United States suddenly awakened and rubbing his eyes caught sight of the intruder. Instantly his face assumed its stern and businesslike aspect. "Well!" he exclaimed, in metallic-like tones and with a decidedly rising inflection.

Johnny Jones, Jr., wiggled. His grin disappeared like a shadow in the sun as he shifted his weight from one foot to the other, and his hands in and out of his trouser pockets.

"Please, I would like to go to work in the shops," he managed to say.

"Finished school?" asked the president in a staccato-like voice.

"Nope! Don't want to go any more, it ain't no good, don't learn anything there."

The big man turned about and for the first time looked his chance caller over carefully. He was about to speak in fatherly tones several times, but somehow he couldn't begin. It may have been the weather, and wisps of memory that flitted through his mind. Somehow he had heard words like that before—or others had heard them from his own lips. And because he was a really great man and greatly interested in young America he forgot his dignity, and calling Johnny Jones, Jr., over beside him, enjoyed a pleasant little visit with him. He tried to find out why school wasn't all right; why Johnny didn't like it; what Johnny did want to do, and concluded by giving Johnny a note to the foreman of one of the shops requesting that his informal caller be allowed to act as helper after school hours. This was on the condition, he solemnly emphasized, that "you go to school faithfully. When you get out you can come over and learn and watch how to run the machines, and perhaps some day the engines."

Johnny Jones, Jr., never knew just how he got out of that room, and he didn't notice the startled look of the private secretary as he went by her. It was just as well, for he wouldn't have understood. Anyway, he had decided that he could stand school—he could endure it some way for the chance to work around the machines out there in the shops.

But back in the velvet-carpeted sanctum the president of the great railroad company was having a vision. He was seeing things and dreaming dreams. His vision was of an elementary schoolroom. It was not by choice the vision of the schoolroom of his youth either—the formal rows of seats, the bare ugly walls and windows, and a lot of languid youngsters droning over abstractions under the guidance of an antiquated "acidulous vestal." As it all came back to him he shook his head to rid himself of it. Then the vision gave place to a dream of a schoolroom that was more like a corner of a foundry, or a sewing room, or a brick yard, or blacksmith shop, carpenter shop, aquarium, herbarium, library or some practical place—the window of which opened on to the school garden. And the teacher—well, some one who could DO things.

To dream was to do, so he worked out his dream in a very practical manner. He made it possible for youngsters to supplement their school work by additional practical study, learning to do things that they liked, using their hands, arms and leg muscles.

"For," said the president, "in these days of repeating rifles and automatics, Yale sent me and my classmates out into the strife equipped with shields and swords and javelins."

It wasn't the fault of the great university that this man became an authority in his line, for the studies in school and college were practically useless as far as fitting him specifically for his life work. So in his realized dream he tried to make it possible to inculcate habits of industry and thinking and practice together with tools and tinkering and doing things, for which, God be thanked, is in every boy and girl. There is that wonderful curiosity about the world that is a vision more compelling than the wonders of Aladdin's lamp.

The Santa Fe Railroad has realized on this dream. It conducts more than a score of such schools in different places along its lines, and reports an attendance of more than 500 boys. The headquarters are at Topeka, Kansas, where the largest school is conducted and where the schedules for all are made out. The sessions continue throughout the year and offer from two to four hours a week on the part of each boy, and with no home work. Mechanical drawing, business letter writing, arithmetic, spelling, mechanics and physics and an outline of civics are taught along with the shop practice.

It is indisputable that the thing we need most in America right now is efficiency, and it is the very thing that is hardest to obtain. If we do obtain it, it is generally at too great a cost. The corporation chiefs confirm this. Now, three-fourths of the matter of efficiency is training, and what is training but practical education.

In the professions this is realized. There are highly efficient schools of medicines, surgery, art, architecture, military and naval science and engineering. These schools have given us wonderfully capable men in these lines. Then why not promote efficiency along other lines as well—in our farmers, our artisans, our foremen, designers, salesmen, builders and workers generally. And by all means let us have efficiency in our municipal administration.

Think of this: Every city in the land is fighting for this thing and cannot get it. Hundreds and thousands of dollars spent for it at every election. We have not yet a single place where municipal administration is taught. Some day we shall train municipal officials and the result will be worth notice.

Any boy who can rig up out of scraps such an "airplane" has ability that should be developed during his formative years.

Is it any wonder that boys and girls, too, often become restless as they reach the ages of life where they begin to want to do things? When their fingers itch for a saw and a hammer, and kites, toboggans, railways, do-dads, and thing-a-bobs are more important than the bounding of Afghanistan.

It was President Eliot who said recently: "Multitudes of American children take no interest in their school work, for they see no connection between their studies and the means of later earning a good livelihood. They drop out of school of their own accord or the parents permit them to go to work, or, if required to attend, they acquire a listless way of working and thinking because of their lack of interest in their studies."

Recent statistics show that the educational mortality is very high. Even in cities of 25,000 population and more, where the best educational centers are located, approximately half the children are scholastically dead at the end of the seventh grade. A third of them enter high school and about one-twentieth graduate. To make it more specific still, ten per cent leave school at 13, forty per cent at 14, seventy per cent at 15, and eighty-five per cent at 16 years of age. You see Johnny Jones, Jr., was going with the majority rather than as an awful exception.

By a public school system that is inadequate as an industrial force, that does not reach nor hold the children it is provided to instruct, we attempt to mold our nation in advanced lines, and noting the results about us we grumble because we have discontented citizens, labor troubles, and general misfits from clerks to executives, from clergymen to street sweepers.

The truth is that the material and method of our instruction are still predominately the product of a philosophy and an economic system that are both out of date. This repels all pupils whose aptitudes and interests differ from those of the orthodox schoolroom, and repels them in increasing numbers as they grow in consciousness of their powers and likings.

The great need is for vocational and industrial training, trade and commercial studies during the critical periods of the lives of boys and girls—the teen ages. Children are then too young for shop apprenticeship, they find little to hold them in the grammar grades or the academic high school. They stop school if at all possible and drift into unemployment or unskilled occupation, or into crime. There is a great need of trade schools connected with the regular state school where diversified outlets into the world would be possible. Such a system of education would command co-operation of parents and employers, and more, it would greatly interest and hold the children themselves.

What Johnny, Jr., and most of his pals need is a school after the order of the Boston Pre-vocational School, now operating in at least three of the school centers of the city. This training is available for children 12 to 14 years of age, who, in the opinions of the parents and teachers, will receive greater benefits therefrom than from continuing in the ordinary school. The time spent in the school ranges from a quarter to a half of the daily school period, and the child is put to work at once on some of the elementary mechanical arts. Every article made is useful, and is designed to serve some purpose in the schools.

There is many a parent of another Johnny Jones, who is driving his boy through the ordinary school, but who, as a matter of fact, is driving him into vagrancy, will find an outlet for the son's best native energies in this sort of school. Every town and city should have such a place.

There are in other parts of the nation thoroughly modern schools that offer wholesome alternation of book work and hand work in the daily program. The industrial reform schools have realized this ideal more quickly than have the day schools. In such places every facility is offered for indulging daily the fundamental juvenile instinct for play, study, manual industry, recreation and sociability.

Then, in spite of the fact that the inmates of these schools are taken up as little miscreants and are usually lacking a close parental sympathy, they are making a surprisingly good showing in the world at large, after finishing their course of training and discipline.

Alice and Hazel like to "play house," rock their dollies, set the tables and sweep and all these other things. Do we encourage them by teaching them how to do these things better? Do we develop their love of domestic science from their first love of it until they are more mature? We do not. We teach them calculus, or geometry, or advanced chemistry, or demand that they write an essay on whether Chaucer or Shakespeare or Captain Cook or William Hohenzollern is the greatest puryevor of facts and fancies, if not, why not, and so on, *ad libitum*.

But thanks to agitation, many schools really teach and train for scientific housekeeping and home-making in spite of the fact that the advocates of the one-room red schoolhouse down the lane said that such things were God-given and should not be tampered with; but nevertheless go to school and learn how to read Dante in the original, for in some way the knowledge would come, whether the beans should be boiled for three minutes or the soup warmed in the skillet.

Now George and Harry come to school with fingers that itch for the feel of a screw driver and pliers and machine hammers, and wires and motors. Do we help them to develop that itch into action? We tell them there is plenty of time for that after they have gone through school and college and learned to parse and diagram, and can tell the reason why the Shah of Persia and the president of Liberia are not the political leaders of their parties.

Yet, strange to say, there are some of these things that we recognize as worth while. Ability in drawing, painting, and speaking is quickly accorded recognition, but the work of carpenters, farmers and artisans is not considered worthy of emphasis during the "sacred" hours of the schoolroom.

The ideal of education is definite today. It is to see that every man and every woman in every walk of life is a true civic unit engaged in useful work, having power as an individual and insight as a citizen. Such are the duties of our educational system.

When we reach that ideal then the Johnnies and the Willies will not be quitting school for a chance to work with the tools of the shops, for they will have these tools to work with as part of their regular education. Our future Edisons will not have to beg and borrow and scheme for legitimate ways of providing themselves with the rudiments of the sciences that they want for progressive inventions; they will be a fundamental part of their early education. Thus they will be able to go further and longer up the road of achievement.

We must take the great majority of boys out of the class of the "I never had a chance," "I missed my calling," "I was not given a square deal," "I have never found my place," such as is declared and reiterated by that great mass that is the supple tool of the "red" agitators.

And, furthermore, the placing of the blame on some one else is, in a greatly increasing manner, right. It IS some one else's fault rather than the victim himself that his life has proved a failure. He was trained wrongly, advised wrongly, directed wrongly, or in all of these ways mistreated by those around him who were responsible for his well-being and were mature enough to have known better than to let his life go to waste. It may have been fair enough under old-fashioned conditions for us to contend that every boy "will find a way or make one," but such is not the case in this day of high specialization. Our motto should be that every common boy must be helped to find his true place in the world and to make it a success.

Top, left—The schools are just beginning to recognize a child's ability to draw, paint and color. If there is real ability it should not be lost in the shuffle of reading, writing and 'rithmetic later on. Top, right—Many a husky lad loves the farm, and many another would find real enjoyment and prosperity there if his teacher could teach him the principles of farm management that would assure his success in the world's oldest industry. These lads are having the time of their lives playing nursemaid to this young porker. Center, left—There is something a little bit more human to a lad who has tried to work a saw and a plane and has succeeded in cutting a board straight, than to the Percies who can read Dante in the original. Center, right—This little girl shows a real love for molding in clay. Without any training she delights her parents and older people with her ability to catch the expressions and attitudes of the people she sees. Our present system of schools will soon eliminate this natural ability, for there is no place for its expression. She will become another machine-made educational product. Bottom, left—Even girls like to tinker. There are now places open in the industrial world for female mechanics. The specialized world in which we live offers a place for skilled workers of both sexes. Bottom, right—Johnny likes to make things. There is real fun in learning how to use the saw and hammer and nails. Vocational schools take this liking and make valuable craftsmen from it.

How the Human Body Fights Germs

By G. H. HEALD, M. D.

FOR the ordinary observer—which means about all of us—it is hard to realize that around the body and within the body there is being waged a relentless and endless guerilla warfare. It is a warfare between the body tissues and certain organisms which live a parasitic existence—that is, they live at the expense of the being which they infest. These parasitic marauders vary in size from worms several inches in length to minute organisms much smaller than the point of the finest needle. Some of these minute organisms are animal, some are vegetable. Naturally, these organisms must find in the body conditions favorable to their growth and multiplication, else they would not survive. They find moisture, food, and a proper temperature, so that if they gain an entrance into the body or into the tubes lined with mucous membrance (the air and food passages, and so on), they may multiply and cause trouble.

The greater number of infections takes place because the germs gain an entrance into some of the passages of the body, particularly the food and air passages, where they find ideal conditions for rapid multiplication.

How They Enter System

With food and drink, and on eating and drinking utensils, and on the other articles which are sometimes put into the mouth—fingers, coins, pipe stems, cigar holders, and a host of others—germs are taken into the mouth; many of them harmless, some perhaps dangerous. And with every breath particles of dust and germs are inhaled, some of which are not harmless. It is true that we have certain more or less efficient defenses against these intruders; the hydrochloric acid in the stomach and the little epithelial cells in the air passages which are arranged as brooms to sweep out germs and other foreign bodies. Moreover, the healthy secretions of the nose are more or less antagonistic to germ growth.

The tonsils in health, and the little lymphatic "glands" or nodes in the neck seem to have the function of destroying many germs that are brought to them. They act as sentinels to the body. When, for any reason, the tonsils and lymph glands are diseased, they no longer form an adequate protection against the inroads of germs.

Not only may the tonsils cease to act as sentinels, but they may actually become badly infected themselves and form a center from which the germs are spread to set up infection elsewhere. Thus after an attack of tonsillitis one may have an attack of articular rheumatism, one joint being affected after another—for the germs are floating around in the blood current—and likely as not they will attack and damage the valves of the heart. In children an attack of tonsillitis may also be followed by an attack of chorea, or "St. Vitus' Dance," another rheumatic disorder. Thus the tonsils, which should be sentinels to protect the body, have in these instances surrendered to the enemy and have been used by the enemy as a sort of headquarters from which to carry on the warfare against the body.

The body has many defenses, in addition to those at the surface—many means of protecting itself against its environment. Were it not so, it would not long survive. When one recovers from any infectious disease it is not because he was cured by some medicine, but because the body defenses have thrown off the invaders.

Right Living a Good Weapon

Most interesting among the body defenses are the white blood cells, which under certain circumstances swallow the germs and digest them. These white cells are efficient or inefficient, according to the general tone of the body.

One who, by the observance of hygienic measures, keeps his bodily condition at par, is much more likely to overcome an invasion of germs than one who, by careless living, or through ignorance, has allowed his physical condition to drop below par.

Besides the white cells there are other body defenses. There is some germicidal principle in the serum, or liquid part of the blood. Moreover the body, when threatened with a germ invasion, may react by forming specific antibodies, designed to antagonize the particular germs, or their poisons, for which the antibody is formed.

In view of the fact that the body is often too slow in forming these antibodies, we sometimes increase artificially the body defenses. For instance, a horse is given minute doses of diphtheria poison, sets up a reaction and develops some antibodies. Then it is given a larger dose and a larger, at intervals of a few days thus increasing the dosage for months, until its blood is rich in diphtheria antibodies or antitoxin. Some of the blood is drawn off, clotted, and the liquid part put up in sealed sterile packages and used as a preventive or treatment of diphtheria. A small injection of the horse serum into the body of the child wards off or cures an attack of diphtheria. In like manner, serum is prepared to antagonize the tetanus or lockjaw poison.

Again, instead of manufacturing the antibodies in the body of a horse, we make the person manufacture his own antibodies. To render a person immune to typhoid fever, for instance, increasing doses of killed typhoid germs are injected into his body, for three times. The body in defense creates typhoid antibodies; and should the person by accident get contaminated water or food, he is comparatively immune to typhoid infection.

Troops in West Virginia

THERE can be no doubt that the President did right in ordering Federal troops to West Virginia on the request of the governor. Two mobs were facing each other, undisciplined, without rational leadership nor a fixed purpose and animated by mutual hatred and moonshine whisky. The situation was one beyond the power of the local and state authorities to control; civil war was imminent. This was recognized even by the officials of the miners' unions, usually so fiercely opposed to any use of the military in strikes. The invasion, indeed, may well be assumed to have been resorted to by the President only as a disagreeable last resort.

Happily, the troops seem to have arrived in time to prevent the situation from developing into a bloody conflict warranting the correspondents' use of such terms as "sectors" and "salients." The incident has afforded welcome proof that regular army officers and regular soldiers may be counted on to hold themselves immune from the hysteria that sweeps mobs on to acts of wild violence and destruction. They have given themselves calmly to their task of averting bloodshed and restoring order.

But the whole matter of conditions in the soft coal regions of West Virginia cannot rest with the present military "demonstration." These conditions plainly call for a congressional investigation.

It is not too much to say that the good name of America and the vitality and stability of democratic institutions are at stake. In his recent speech before the War College, President Harding said:

"We ought not to have a conflict like that which is going on in West Virginia. It is due to lack of understanding."

Right-minded men and women the country over, regardless of party, must agree with the President in this view. When the first Federal soldier set foot in the soft coal region, West Virginia's problem became the nation's problem—one about which the people are entitled to be fully informed. The explanations that have usually satisfied public opinion regarding similar instances of disorder will not satisfy public opinion now. It will not do to declare vaguely that the trouble makers are "ignorant foreigners under radical leadership," or avowed Bolshevists with a plan to overthrow the government. The miners of West Virginia are for the most part native Americans of native parentage. They are fairly intelligent men with long traditions of loyalty and patriotism behind them. Such men do not lightly abandon work and arm themselves in resistance to recognized authority.

"Lack of understanding," President Harding says, is at the bottom of all the trouble. It is at the bottom of most troubles between employers and employes, as between individuals and nations. It is something then, which can be cleared up and should be cleared up by turning on the light. This in the interests not merely of the immediate parties to the quarrel, but, what is more, of that genuine Americanism which is synonymous with justice and fair play.

Tax Simplification

SENATOR SMOOT is earning a reputation as the Great American Tax Simplifier. The very multiplicity of the imposts under the present internal revenue law makes it irritating and onerous. To the average American, there is something decidedly savoring of governmental inquisitiveness and interference in the compulsion to pay a tax to the Federal Government every time he buys a drink at a soda water fountain, or a railroad ticket, or admission to a theater or a movie show.

There are some 30 of these annoying taxes in force just now, and it is practically understood in Congress that some of them must go. Senator Smoot goes further and proposes that they shall all be repealed and that the revenues of the national government be raised by six new taxes to the exclusion of all others. He estimates that all the revenue needed would be realized from a tax on incomes, the maximum of which is not to exceed 32 per cent; a 10 per cent tax on the net profits of corporations, a tax on tobacco, an inheritance tax, a three per cent tax on manufacturers' sales, and a tax on imports.

Although the principle of Senator Smoot's sales-tax has been indorsed by the United States Chamber of Commerce after a referendum to its members, its practicability is exceedingly controversial. In many cases, it is not easy to decide who are manufacturers and who are not. Several independent manufacturers contribute to the completed product in numerous instances. If each pays the tax, we have double, and so unjust, taxation. If the last man in the series pays the whole tax, all who went before are enabled to shift their burden to his shoulders.

Both in its assessment and in its collection the tax on bank clearings already discussed in these columns appears to offer many advantages over Senator Smoot's six taxes. And if he is really going in for simplicity, why does he not bring forward the sweet simplicity of the undodgable and entirely equitable single tax on land values?

Who Pulls the Strings?

ANTITHESIS is the soul of humor. That play and counterplay of forces which so largely focus the attention of the philosopher and the scientist make possible those vivid contrasts of situation in comedy that appeal to the risibles.

Just now we have interesting, if not amusing, illustration of the counterbalancing of opposites in the business situation in these United States. About a year ago, the Federal Reserve System decided that "to save the country," contraction of credits and deflation of currency were in order. At the eleventh hour, after leading manufacturers had already adopted measures to move stocks by price cuts, and so to lower prices gradually, this action of the controllers of our credits and currency helped to bring things down with a rush.

As one result, there was no money in the country banks to move crops, although there was plenty of money in the New York banks for speculative call loans. So speedy was the deflation that the growers of cotton and corn and wheat and wool, in the West and Southwest, found these things—the only things they had with which to pay their debts and buy the things the manufacturers produced to keep their families and their farms going—had shrunk something like five billion dollars in value. The farmers of America were precisely in the position of men robbed of these five billions by an invading army making forced levies. As far as their own ability to purchase what they needed goes, they might have suffered the loss of one-half of their ten billion dollars' worth of corn and cotton and wheat and wool by fire or flood. Yet government agencies took this immense sum out of the farmers' pockets without enriching the government Treasury by a penny.

With a decrease of five billions in the people's purchasing power, there was naturally a shutting down of factories and the throwing of millions of workers into compulsory idleness. Export trade, as well as domestic, suffered. So to make up for the deficiencies of the Federal Reserve Board in "helping business," the War Finance Corporation was revived and Eugene Meyer, Jr., was placed at its head.

Mr. Meyer tells us that his corporation, in the last 60 days, has directly arranged, through the extension of credits to southern cotton growing associations, banks and other business institutions, for financing the export of approximately one million bales of cotton, or one-eighth of the surplus now on hand, compared with a normal surplus of 1,500,000 to 2,000,000 bales.

And to this action of Mr. Meyer's corporation he attributes "the steady advance in the price of cotton, adding hundreds of millions to the wealth of the South and relieving a situation bordering on bankruptcy."

Of course, Mr. Meyer's "financial genius" has not really "added billions" nor added one cent to the actual wealth of the South. Neither did Mr. Warburg's Federal Reserve Board deduct a penny from that actual wealth. Yet we tolerate a system by which "values" are put up and down, to the impoverishment of the people and the utter demoralization of the nation's industries!

How we used to laugh at the quaint quips and rejoinders between the "end men" of the old minstrel troupe, as called out by the sober "interlocutor" in the middle. We can almost hear the touching trilogue:

"Brudder Bones, you spoke that little piece real pretty. Now Brudder Tambo, it's your turn. What can you say to entertain us?"

People Are Good

THIS is a pretty good old world after all! Every little while newspaper readers experience a saddening of heart in perusing reports of happenings calculated to depress and suggesting that we are going to the "demnition bow-wows," as Major Joey Bagstaff put it. Selfishness and self-indulgence, eventuating in the sort of thing we libel the lower animals by characterizing as "brutal," makes a dent in our faith in human nature. There is certainly much in the day's doings of these post-war days to feed the tendency to cynicism and pessimism.

All the more, we should be quick to recognize events, few and far between though they may be, which kindle hope anew and cause us to feel that at heart, the world is full of kindness, of love and of beauty: that, in truth, man was made "a little lower than the angels and crowned with glory and honor."

Of such cheering significance is the story of how Mrs. Frank O'Connor and her nine children have been established in a comfortable home by New Orleans people who have shown themselves true neighbors. Only a few months ago, the husband, father and bread-winner of the family was killed by a fall. Mother and little ones struggled along bravely for weeks. But the struggle became too much for them, and they were on the verge of being evicted for non-payment of rent, when a local paper made their plight known to the public and appealed for help in their behalf.

The response was immediate and adequate. What is more, it took a form that means much more of kind-heartedness than would mere money doles. The home into which the O'Connor family moved the other day was constructed by union workers who labored without pay, out of materials donated by builders' supply men, on a lot purchased out of a purse made up by real estate dealers; and it was furnished without charge by furniture dealers who vied with each other in making their offerings. It is a thing of this sort that brings realization of the blessing that blesses givers not less than receivers. And it will doubtless prove an example of far-reaching influence.

"How far that little candle throws its beams!
So shines a good deed in a naughty world."

Help for Philippines

ON THE urgent suggestion of General Leonard Wood and former Governor General Forbes, indorsed by Secretary Weeks, Congress has wisely decided to come to the aid of the Philippines in a serious financial emergency by passing the bill authorizing the insular government to increase the limit of indebtedness from $15,000,000 to $30,000,000.

One of the early results of the work of the special commission appointed by President Harding to visit the Philippines and investigate actual conditions, with reference to the early fulfillment of our pledges to pull down the American flag there and allow the islanders to set up an independent national government, seems to be a sober re-examination of the problem on all sides. Undoubted champions of Philippine independence now suggest that it may be wise to go slow. This quite as much and as sincerely in the interest of the Filipinos themselves as in that of the United States.

The consideration for national aspirations shown by the Wood-Forbes mission, of which the seconding of the request for an extension of the Filipinos' borrowing power is an example, seems to have strengthened the feeling of trust in American good faith.

Americans in the mass have a very proper regard for the aspirations of small peoples to nationhood. One of the shibboleths of the Great War was that the sword of justice was taken up to protect the rights of small nations. "Self-determination" has been one of the most fertile of the assertions of rights in Wilson's famous "fourteen points." Now it is being asked if political independence is really a wise desideratum in every case and under any and all circumstances.

May it not be worth inquiring if the system which unites such diverse and separated populations as those of Virginia and California, Maine and Texas, while recognizing their essential autonomy, may not also prove elastic and adequate enough to include Alaska, the Philippines, Hawaii and Porto Rico? Acting on the principle that "dependencies," "possessions," "colonies" or "dominions" have no logical place in a democratic republic, shall we not find means to erect into sovereign states proud and happy to be included in our federal commonwealth the Philippines not less than Alaska and the Virgin Islands?

We have assumed and we have discharged to some extent duties in regard to peoples and territories taken under our protection and our rule. How can we escape the taunt of and the taint of imperialism if we continue to govern these peoples as outsiders, unrepresented in and indeed excluded from our essential governmental system? What was that the fathers of the republic said about "taxation without representation"?

Mr. Ford's Page

THERE are many good people in the world who are in great mental distress because they see very clearly the evils which exist, and because they are impatient to do away with them. This combination of clear seeing and impatient spirit is very destructive of interior peace, and many are running around with the impression that the rest of the world is wrong because it takes the matter less anxiously.

Every man who is doing something, knows that there are thousands of people who have each chosen another thing that they think he can do. And most of these thousands are people who are troubled with the disease just mentioned—clear seeing, complicated with an impatient spirit. Their home-made prescription by which they hope to cure themselves seems to be a very simple one, namely, to get some one else started on the line of action which their impatient spirits dictate.

There is a surprising number of people in the world who would be immensely relieved if you—"you are the one person in this world to do it"—would simply do the thing they want done, and which they are sure is the only proper thing to do.

It is a rather difficult matter to deal with, because most of the activities proposed are good, with a promise of being useful. But most of them will never be realized at all, because they will never be done by one person for all the rest, but rather by all the people for themselves. And another reason is: the people to whom the work is given have the habit of looking around for someone else to do it.

What we overlook is that only people can do things. It seems simple enough to say, and yet it is hardly simple enough to understand. Any number of individuals are buzzing around the world today under the delusion that people are the last element to be selected, on the theory that you can always get the people if you can get the money.

Indeed, that is the new process of beginning a "good work"—induce somebody to give money, and then, after the money is given, the person who receives it will undertake to find people to do the human side of the work; the consequence being that in a short time you discover that "the work" never had any human element at all, and that the money which it certainly had is gone.

One would say offhand: If you see a thing to be done, go and do it. If you cannot do it all, do what you can; you cannot take the fifth step until you have taken the first four. If you cannot do anything at all, consider whether the time has come to do anything. Times grow ripe, like everything else; yet many people think they can pick ripe events off green years; which cannot be done any more than ripe apples can be picked in months when they are green. Many reforms are picked green; many progressive plantings are done, not in mellow soil, but in the frozen ground. People don't observe the times and the seasons.

Now, take the evils in the world. They are many, and perhaps the weightiest burden we have to carry is the wonderment that they are allowed to exist. But there they are. Everybody doesn't see them; but you, let us say, can see them clearly. Everybody doesn't realize how these evils are eating into the life of the people; but you, let us say, see it so clearly that it is a pain to you.

Now, you can spoil your own life, sour your friends and bring your very vision into question by insisting that everyone sees exactly what you see. They will see it when the time is ripe, but not until then, and you are very foolish if you fret about it.

There are men working day and night on the problem of cancer; but as for you, you don't think much of cancer because it has not come within your life. And you would possibly resent it very much if a cancer researcher should continually insist that you take up an interest in cancer. You would say, "I don't want to. I am not called to consider cancer. That is your field, not mine." Very well, you would be right.

Don't you see that with everyone working in his field, not insisting that the whole world come in also, much is being done? Every little while reports come from this field or that of achievements, and you had not even heard that men were working in those fields. Yet they are, each doing his work, and when the time is ripe, up goes the flag and the job is completed.

There are sentries along the frontiers of all our problems, men and women here and there who are sometimes lonely, who wonder why they must pace their beat alone; but we know that where sentries walk now, the whole army will march soon. Some people are sentries, to whom it is given to be on watch, this one on the frontiers of cancer, this one on the frontiers of financial diseases, this one on the new boundaries of statesmanship, this one on the limits of a new order of social life. Sentries all, but never so foolish as when they insist on calling the whole army out before the day dawns.

If it is given to a man to see that a certain condition exists, he is sentry at that point to give the alarm. Presently at the right time, the time set by the director of destiny, his work will bear fruit.

"Well, but," the impatient spirit cries, "what about the evil done in the meantime? We must do something to prevent that!"

Well, do it!

"But," says the impatient spirit, "I can't do it." Rightly said; you cannot, neither can anyone else. You cannot ripen an apple faster than it will ripen, and you cannot rot it faster than it will rot. These things appear to be under the law.

The people have the evils they deserve, no more, no less. By "deserve" one does not mean the judgment which any human being can pass as to desert; one means that all of us together have the sort of life that we have made, and we will continue to have it until we are fit to remake it in better quality.

When people begin to feel the evil; when there runs through society a new consciousness of the stupidity and the wrong of certain things; when false notes begin to irritate us; when the heat of indignant resentment begins to break out in thought and speech—these are the first streaks of the new day, or, to change the figure, these are the first flushes of color which begin to show that the fruit is ripening for the autumn.

What is needed by people who see the evil is a still clearer sight; they need to see that the evil will collapse, utterly collapse. And what people of impatient spirit need to learn is that they must detach themselves from the system they despise and turn their efforts against it.

All of us want to slay the giant with one dramatic stroke of our sword. As a matter of fact, the giant usually dies from self-generated poisons.

Whatever the moral judgment of the morally sensitive people is against, that thing is inevitably doomed. Though it become the social rage and sweeps all the people within the circle of its viciousness, it is nevertheless doomed. Indeed, when you see evil at the height of its popularity and power, when you see all who speak against it ridiculed and despised, you may be very glad—for from that apex the fall is swift and sure. Never forget that. That is the ripeness of the times for the fall of the fruit. It falls, it rots, its pulp fertilizes more wholesome growths.

THERE is an impatience which is founded on fret and not on faith, although its cause is an anxiety for the progress of the Good. The destruction of evil and the progress of the Good wait on the law of ripeness and decay, as much as any fruit does. Some people try to pick ripe reforms in green years; but the times are not yet ripe. When it is given a person to see what is wrong, that person is a sentry on that frontier; he is stationed there until the main body of the army comes up. He must wait and watch. Impatience is an insidious sort of disloyalty that lures us from our posts which may have none to watch them if we desert.

First New-World State to Try Profit-Sharing

By HARRY H. DUNN

PROFIT-SHARING, now passed beyond the experimental stage in the plants of many American industrial corporations, is being given its first governmental sanction in the New World by a state in Mexico. This state, which is Vera Cruz, the richest, most densely populated and probably the most advanced, industrially and commercially, of all the 27 states of the southern republic, has decreed, through a law passed by the state legislature, that all workers shall share in the profits of the firm, company, corporation or individual by whom they are employed.

Mexican wood cutter and carrier, of the state of Vera Cruz. Most of the smaller towns, and many of the larger ones, are supplied with fuel by these *mozos*. He is wondering how the new Soviet system will benefit him.

The law has been in effect about two months, but was made retroactive, so that its operations extend backward to February, 1917, the month in which the civil forces of Venustiano Carranza, then president, came into control of the state, taking it over from the revolutionary forces. The revolutionary leaders had promised that such a profit-sharing law should be passed, but as President Carranza insisted that the military should not formulate any new laws for the civilian population, nothing was done about the matter until after the civilian officials had taken charge. Then a legislature was elected, pledged, among other reforms, to the enactment of this law. While this newly-elected legislature was waiting to take its seat, however, the revolution led by General Alvaro Obregon, overthrew the government of Carranza, and the state legislature of Vera Cruz was suspended, or suspended itself, reports are not clear as to just what happened, until the civilian officials of the Obregon Government could take charge. True to his promises, however, President Obregon did not disturb the various state legislatures, and changed few of the state officials. This left the state legislature of Vera Cruz in office and free to carry out the pledges on which it had been elected, among them the passage of the profit-sharing measure.

This bit of history is necessary to a complete understanding of this unique experiment by a state in the Americas, and brings out, further, the fact that the national government of Mexico had nothing to do, either with the inception of the idea of profit-sharing laws, or with the action of the state in passing them. In addition, it shows that Mexico's national government is approaching the desirable condition of non-interference with the state governments, as long as they confine their attentions to matters concerning the state in which they function. In view of these two conditions, the attitude of the federal government toward this experiment in state profit-sharing is of interest, possibly of vital moment to the continuation of the experiment. Of this, however, more hereafter, since the actual results attained by the experiment in the state of Vera Cruz are most important of all the sides to a situation which, if successful in the place of its beginning, may become a national factor.

The new law provides, briefly, and translated into plain English, that all workers, irrespective of sex, age, character of work performed, or any other qualification whatever, except that of seniority in employment, must—not "shall" or "will," but "must"—share in all profits taken by the firm, company, corporation or individual by which they are employed, forward from the date of the passage of the law forever. Further, these employes or any others who are employed or have been employed by any person, company, firm or corporation, back to February, 1917, or for any period since that date, must share in all profits taken by their employers during the period of their employment. That is to say, the man or woman, boy or girl, who has worked for any one employer, or for any number of employers, any time since February, 1917, is entitled to a share in the profits of that employer or those employers for such time as he or she may have worked for him or them. Workers who have been employed by one employer continuously for these four years, are entitled to a share in the aggregate profits of all four years. The man or woman who has been employed continuously for all four years by one employer, however, gets a larger share of the profits than the worker who has been employed by more than one employer during that period, since length of service is placed at a considerable premium in the percentages of the profits allowed to the workers. The profits mentioned are the net profits.

The minimum share of any workers in the profits of any individual, firm, company or corporation, is ten per cent. That is to say, if an employer employs only one worker, that one employe is entitled to a minimum of ten per cent of that employer's profits; if the employer employs any number of workers more than one, the entire body of workers is entitled to a minimum of 10 per cent of the profits, the ten per cent to be divided equally among the workers. This 10 per cent, however, is merely the minimum. The workers' share may be as high as 50 per cent of the profits, or may be fixed at any figure between 10 and 50 per cent, but it must not be less than 10 per cent. Seniority of employment also is taken into consideration in the division of the percentage of profits among the workmen. While the detailed working out of this ratio of shares among the working people is left to a commission especially created to handle the entire profit-sharing project, the legislature makes it plain that the employe who has worked longest for an employer, is to receive a larger share of the "dividends," as the workers' share of the profits are called, than the employe who has just commenced to work for this employer, and so on.

The legislature created a special commission, to sit permanently, and to have complete charge of the profit-sharing project. The duties of this commission are to fix the percentage of profits to be allotted to workers in each industry, business, commercial or agricultural undertaking, and so on. Thereafter, the commission is to fix the share of each employe in each group, or to establish a ratio according to length of employment, whereby the leaders of the groups of employes may figure out exactly the amount to which each employe is entitled. These dividends are to be paid once a year, but the date of payment is left to the decision of the employer. That is to say, he can pay it at the time best suited to the condition of his finances, but he must make official announcement of that date, which must be the same each and every year, and must disburse such shares in the profits promptly on that date.

This commission has the power to decide which employers shall pay "dividends," which employes shall receive them, how much each employer shall pay, how much each employe shall receive, and, if there is any attempt on the part of the employer to evade payment of the shares in the profits to the employes, to seize that employer's property and sell it immediately at public sale, dividing the proceeds of that sale among the employes who were entitled, under the law, to the dividends which the employer refused to pay. Appeal may be taken from the decision of the commission to the civil courts of the state, and from them, in turn, to the supreme court of the state and thence to the supreme court of the nation. Incidentally, steps are now being taken by two foreign industrial corporations operating in Vera Cruz, to test the constitutionality of the law through the courts of Mexico. In preparation for this, the legislature of the state is preparing an amendment to the state constitution, embodying this law, which will be adopted at the next session of the legislature.

Crowd in the streets of the city of Vera Cruz the day the first plans for the present Sovietization of the state government were laid.

In view of this test case, the national government of Mexico has instructed Governor Tejada, of the state of Vera Cruz, to suspend enforcement of the law against foreign-owned corporations and against foreign individuals, until a decision has been rendered by the courts. American, British and French firms have protested the law to their respective governments, but the state of Vera Cruz has stood fast behind the law, and the federal government has refused to interfere beyond holding up the seizure and sale of foreign-owned property until the courts have had an opportunity to pass on the constitutionality of the statute. The chief protest of the foreign individuals and firms seems to be to the retroactive section of the law, rather than to its present and future operation. Some of the most brilliant legal minds of Mexico are now working on these attacks on the new law, either in behalf of those who are seeking to overthrow the law, or in support of the state's action. There seems to be a growing opinion among the newspapers of Mexico City and of the state of Vera Cruz that the retroactive clause of the law will be declared unconstitutional, but that the law itself will stand.

The dividend commission in charge of the profit-sharing law and its administration, is also a court of appeal for the grievances of the workers. The commission has the authority to call out all the police powers of the state to enforce its decrees, and is also empowered to assess against employers the costs of any cases brought before it by the employes of those employers. The injunction, as known in the United States, does not exist in Mexico, but employers of large bodies of labor—native employers, since the foreign employers are not feeling the effects of the law and will not feel them until the courts have decided the test cases—are resorting in some cases to other methods to escape paying the dividends. These methods were discussed with the writer by Domingo F. Ybarra, of Mexico City, an expert on international law, as follows:

"The majority of the employers of the state of Vera Cruz are not opposing the law. They realize that the workers of Mexico have been underpaid ever since the Spaniards landed in the country more than 400 years ago, and they understand that, in some way or other, these workers are now determined to get a share in the wealth they produce. Some of the employers, however, notably the owners of large agricultural properties and coffee plantations, are endeavoring to escape the workings of the law by reducing wages and lengthening hours of labor, thinking that the shares in the profits they have to pay their workers each year will be less than they will save in the reduction of salaries. The commission in charge of the enforcement of the new law, however, has made a list of all employers in the state, and is checking up those who have reduced salaries and wages, so as to give their employes a larger percentage of the profits than would have been done had these employers met the law with honest intent.

"It is possible, in my opinion quite probable, that the retroactive clause in the law will be declared void by the courts; if not by the state courts, at last by the supreme court of Mexico. If this clause is removed, I believe there will be little objection to the law on the part of foreign employers, since, with the exception of the oil industry, the average wage of workers in other industries throughout Vera Cruz is rather less than a dollar a day, and almost every man at all connected with commerce or industry in Mexico knows that the working people cannot subsist, much less advance themselves to any condition of prosperity or self-respect, on such wages.

"In fact, my opinion is, and I am confident that officials of the state and national governments hold the same opinion, that the legislature of Vera Cruz really was seeking to compel an increase in the wages paid to labor on the gulf coast of Mexico, rather than to reduce the legitimate profits of individuals or corporations when it passed the law. The federal government has been seeking ever since General Obregon became president, to find some means whereby the wages of the working people could be increased and their condition improved throughout the country without impeding industry or reducing commerce, either between the states or with foreign countries. With this end in view, the federal government has undertaken several large road-building and irrigation projects, but, naturally, has not been able to absorb all the labor thrown on the market by the disbanding of revolutionary armies containing nearly 200,000 men. For this reason, too, the federal army has been kept at 100,000 men, when General Obregon desired very much—as he had told me several times—to reduce it to 50,000 men or less. If employment could be found for half or more of the present army, it would be cut at least in half.

"Possibly, the state government of Vera Cruz is pointing the way to action by the federal government throughout Mexico. I know that President Obregon; Governor Tejada, of Vera Cruz; General Plutarcho Elias-Calles, secretary of the interior, and Adolfo de la Huerta, secretary of the treasury, are much in favor of the experiment and of allowing it to continue to a natural conclusion, to see just what the economic result will be."

George Washington in Trafalgar Square

THE deep significance of erecting the handsome bronze statue of George Washington in front of the classic portico of the National Gallery on Trafalgar Square, in London, in just that spot evidently is sinking into the English mind. Washington shares with Nelson and Gordon and Napier and other British worthies what has so often been called the "finest site" in Europe. The whirligig of time, does indeed bring its revenges. An equestrian statue of King George III occupies a spot just beyond the southwest corner of the same square from whose northeast and higher corner now looks serenely the effigy of the republican George whom the royal George deemed an arch-rebel against his authority and who might have been hanged had he failed and been caught. Nor did the event of the dedication of this beautiful bronze lack added significance in the fact that on the very same day (June 30), General Smuts, to whom the Empire and the world were looking for happy initiation of Irish reconciliation, was unveiling a memorial to South African soldiers in Richmond Cemetery—another fighting rebel came into his own in overflowing measure, in and—marvelously enough—his own lifetime!

The work is a replica of Houdon's famous statue, erected more than 100 years ago in front of the state capitol at Richmond, and shows Washington in his general's uniform, his left arm resting on the top of a column over which has been thrown a military cloak. The straight-ahead square look of the eyes, the poise of the head and the dignity of the erect figure all convey strongly the sense of grace, strength and sincerity we associate with the character of the Father of His Country. The inscription on its pedestal reads:

Presented to the People of Great Britain and Ireland by the Commonwealth of Virginia, June 30, 1921.

The Virginia State Commission, which had come to London to present the gift to the British people, was headed by Dr. Henry Louis Smith, Lieutenant Governor B. F. Buchanan, Richard L. Brewer, Jr., speaker of the Virginia House of Delegates, and John W. Williams, clerk of the House of Delegates and keeper of the state rolls. The cord which actually dropped the veiling folds of Old Glory from the statue was pulled by Mr. Brewer's charming daughter, Judith, a typical Virginia girl. The formal unveiling took place in the presence of an immense crowd of spectators filling Trafalgar Square and St. Martin's Lane. A score or so of G. A. R. and Confederate veterans living in London occupied places of honor. Preceding this scene, a more elaborate ceremony took place within the National Gallery and was presided over by Marquis Curzon, secretary for foreign affairs; the Virginia Commissioners occupying seats of honor on his left. The gathering was a notable one, including Butler Wright, counsellor of the American Embassy, representing Ambassador Harvey, who had been called to Paris for a Supreme Council meeting; Viscount Bryce, Lady Astor, M. P.; F. W. Massey, the New Zealand premier; Lord Charnewood, Lord Lee, of Fareham; Sir George Perley, Canadian high commissioner; Major Ian Hay Beith, General Marlborough Churchill, Dr. J. W. Jowett, Dr. Nicholas Murray Butler, Admiral Niblack, Commander White, U. S. N.; Lord Desborough and such journalistic big guns as J. L. Garvin, of the *Observer;* Lord Burnham, of the *Daily Telegraph* and Lord Riddell, of a score of dailies and weeklies.

Dr. Smith's presentation speech was a gem of power and impressiveness. After telling how the gift was originally intended seven years ago to fittingly celebrate the close of a century of unbroken peace between the kindred nations, he went on to say that, after fighting and dying side by side in the struggle against a common foe, the two peoples had now learned for all time that blood was thicker than water. They presented to Great Britain, he went on, in behalf of the people of the state of Virginia, the likeness of one who forsook Britain's flag, rejected her sovereignty and fought against her king. With splendid and characteristic magnanimity, Britain had answered the challenge by placing the one-time rebel on a pedestal amid the mighty monuments and memories of Trafalgar Square. With Virginia's gift to Britain went her whole heart. They brought the assurance of undivided fellowship and friendship of the great body of American citizens. "The shrill cries of hate that were sometimes heard were but the clamor of a narrow and turbulent shore line, not the voice of the great deep that lay beyond." Theirs was a world friendship that had come to stay. Representing the thinking millions of America, he added to his message the plea that the English speaking nations of the world, so recently united in war, should unite again for the more complex tasks of peace, and in closest and most unselfish co-operation, enter at once on a joint program of world leadership and reconstruction. Speaking in behalf of 100,000 other American parents who had given their sons in the supreme sacrifice, and of 5,000,000 more who risked that incomparable loss, he declared that they had sent their sons not to protect America but to rescue humanity. Would to God that the English-speaking nations might rise again and forever to those lofty heights of international co-operation for the common good.

Marquis Curzon, whose appreciation of America, it will be remembered, was very distinctly shown in his choice of an American bride in his second, as in his first marriage, was at his best in a speech hitting the happy mean between the grave and gay. Among other things he said:

> "I suppose that the features of Washington as depicted in that historic statue—features so calm, so dignified, so noble—are better known than the form and features of any man in the world, with the possible exception of the first Napoleon. Probably more speeches have been made about Washington than about any human being who ever lived, with the possible exception of Bobby Burns. No one would have hated this more than Washington himself."

Proceeding, Lord Curzon asked why it was that they as Englishmen gladly and proudly welcomed the statue of Washington. The answer was because he was a great Englishman—one of the greatest Englishmen who ever lived; because, though he fought us and vanquished us, he was fighting for ideals and principles which were as sacred to us as they were to the American people, and which were embedded in the very fibers of our common race. The defeat that he inflicted upon us was our gain; he laid the foundations of a structure which we could never have laid, and which required for its accomplishment the genius of an emancipated race. One of the remarkable things in reading the history of Washington was that his merits were recognized by Englishmen even in his lifetime. He had always thought it a moving thing that when the great man died and the news of his death was borne across the waters, the British fleet flying at anchor lowered their flags to half-mast in honor of the illustrious dead.

The bronze figure is a replica of the Houdon statue in front of the State Capitol at Richmond, and is the gift of the state of Virginia to the British people. It occupies a remarkably conspicuous site on the greensward in front of the left wing of the massive portico of the National Gallery facing Trafalgar Square. The group of immediate participants in the ceremony includes (reading from left to right): the Marquis Curzon, Secretary for Foreign Affairs; Dr. Henry L. Smith, President of Washington and Lee University, representing Governor Davis; Lieutenant Governor Buchanan, of Virginia, Speaker Richard L. Brewer, of Virginia House of Delegates; his daughter, Miss Judith Brewer, who unveiled the statue; Sir George Perley, Canadian High Commissioner, and John W. Williams, Clerk of the House of Delegates and keeper of Rolls of Virginia.

"What was it that made this man one of the greatest personalities of all time? The answer lay in his personality and in his achievement. His personality represented integrity of character, nobility of soul, modesty and dignity of demeanor, and sagacity of judgment in a degree rarely combined in any human being. To deal only with his political achievements, Washington created a government and made a nation. He became ruler not by birth or inheritance, not by accident, not by right of conquest, but by the free choice of a unanimous people. Rarely, if ever, had there been a nobler life, rarely if ever had there been a more comely or more gracious death.

Washington found himself in Trafalgar Square alongside the fiery Napier, the noble-minded Havelock, the heroic Gordon; and the glorious Nelson looked down upon the wonderful gathering. If the spirits of the departed could revivify and reimbue the bronze or the marble effigies, if in the stillness of the night they could hold converse, what a symposium there would be! Three gave their lives for their country, one added a province to a great empire, the other added a great empire to the world. Of each it could be said that the mainspring of his life and action was duty; of all of them it could be said that their lives enriched the records of mankind.

They welcomed the introduction of that statue to the square as a symbol and a sign. "It is a mark," said Lord Cuzon, of the fact that the two branches of the great English-speaking race are now and henceforth indissolubly one.

> It is now more than a hundred years since we last fought, and that conflict was one of which none of us are proud, and of which some of us are very much ashamed. We can never fight again. I should like to add that we can never quarrel again. We ought never to quarrel again. But not merely can your nation and mine engage never to fight and never to quarrel; we can do a great deal to prevent other nations from fighting. That, I submit, is the main function and duty that lies upon us in the future. It is a great and powerful weapon that is in the hands of these two great nations, and if our use of it is inspired by the temperate judgment, the lofty nobility of soul, and the unselfish purpose of George Washington, we ought to be able to use that weapon for the inestimable advantage of mankind."

At a luncheon given to the Virginians at the Carleton by the government following the unveiling, Lord Lee, of Fareham, presided and voiced some interesting speculations as to what Washington would have thought had he been in London on that day without any knowledge of the intervening course of history. "How remarkable things would have seemed to him!" he said. "Perhaps the most remarkable thing of all would have been that a daughter of Virginia should be the first woman member of the British Parliament. He would have marveled that, in spite of his meticulous advice about European entanglements, 2,000,000 American soldiers had crossed the seas to join in battle side by side with the British; that Old Glory and the Union Jack had gone into action together against the countrymen of Baron von Steuben." As to the statue unveiled that day, Washington would have been far too modest to think that the bread he cast upon the waters in those far-off days was returning in the shape of admiration and appreciation on the part of the British people of the things he stood for. It was because he stood for what he did that we honored him today, and it was because we had learned the lesson bestowed on us in that period of our history that it was possible in the great conference of the empire now assembled in London to find General Smuts sitting at the board, the great fighting leader of the people with whom we were in conflict but a few years ago. That was something we had learned from Washington, and for which we were peculiarly grateful to him."

Anglican *savoir faire,* marked the delicate regard for the special susceptibilities of the Southern guests shown by Lord Lee in his tribute to two other great Virginians: Robert E. Lee—"with whom it was his greatest pride that he was distantly related"—and Stonewall Jackson, "one of the greatest military geniuses whom war had ever produced."

Lieutenant Governor Buchanan replied in kind, asserting that although his family had lived in Virginia for 200 years, he had inherited sentiments of admiration and respect for England from his father's loins and imbibed them from his mother's breast. It was but natural, he added, that a daughter should love her mother, and Virginia was England's eldest daughter in the Western Hemisphere.

Washington and Lincoln have had to wait long for their statues in the heart of the ancient British metropolis; but not nearly so long as one whom many consider to be truly the greatest of Englishmen—Oliver Cromwell. It was not until a few years ago, early in the reign of the present king, indeed, that it was felt that Cromwell could be honored with a statue without somehow insulting and offending the throne! From his vantage point in the yard of the Houses of Parliament at Westminster, Cromwell in marble looks across at St. Gaudens' Lincoln at the head of Victoria street, neighbored ironically enough by the gilded effigy of that arch-imperialist, Benjamin Disraeli. Only five minutes' walk straight up Whitehall separates the English revolutionary leader who defied Charles I in 1642 from the American who defied Charles' successor in 1776. Cromwell, Washington, Lincoln!

Jew Wires Direct Tammany's Gentile Puppets

Surrender of New York's Political Organization Complete; Real Rulers Permit Fronts to Carry Out Yiddish Idea

THE proposal that non-Jews emigrate from New York City, 500,000 in the first exodus, and 500,000 in the second, to hasten the event which is held to be certain of occurrence, namely, that New York shall become an all-Jewish city, may be a joke; but it is no joke that the Jews themselves discuss and have proposed that the City of New York be separated from the state of New York, and made both a state and city in itself. This would entail three governments—state, county and municipal—whose offices the Jews could parcel out as they pleased. Besides it would rid them of Albany. It is a most amazing fact that the state capital, bad as it is, has always been able to defeat the New York Jew in his most ardently pursued quests, as notably, his insistent appeal to abrogate the Sunday law.

Of course, if the non-Jews emigrated from New York, the Jews would soon follow. They are not self-sufficient. If New York could be isolated, Jewish initiative would not suffice to provide enough potatoes for the inhabitants.

It is too trite to say that New York is already in the hands of the Jews. But it would be most startling to give a schedule illustrating how completely this is so. The New Yorker himself can scarcely comprehend the extent of his vassalage to the Jew. The average intelligent New Yorker does not know what the Kehillah is, nor yet how it works. Like the child born within sound of Niagara Falls, the New Yorker takes Jewish supremacy as a matter of course, as the way things should be, and as the way they probably are elsewhere. The New Yorker is thus like a native of the Balkans.

Hylan and Hirschfield Today

THE Hylan administration, ostensibly non-Jewish, is really Jewish, as any New York administration must necessarily be, except there should arise a man whose ambition would be to prove that New York could be better governed if the Jews should be excluded from the government. Well-informed New Yorkers say that the power of Hylan is Hirschfield.

This is a rather peculiar situation to those who do not understand how the Jewish leaders work. Directly you say the Hylan administration is Jewish, it is objected: "But it is the arch Jewish inquisitor, Untermeyer, who is trying to break down the Hylan administration!" Exactly. That is the game. It's inside and outside that does it. There is power gained in making them and there is power gained in breaking them, and often it is profitable to try both ways with the same man. That is the way Russia went: there were Jews plentifully sprinkled throughout the government of Russia (in spite of the "persecution") and there were Jews outside. Between the two, they got Russia. It is the same in a Texas city today. Four non-Jewish candidates for postmaster were made the center of a political deadlock—up through the deadlock pops a Jew as a compromise candidate for all sections. A sufficient number of Jews were available in that city to keep all the non-Jewish candidates in a deadlock until their own man was trotted out. The "Gentile mind," of course, does not easily realize these turnings and twistings of group conspiracy. And that is why the Jews feel safe, as a rule: they rely on what they call "Gentile stupidity." The Gentile says, "incredible!" And the traditional Jewish game is incredible, until by mountainous proofs and centuries of illustration the actuality of it is forced home to the mind.

New York's Jew Departments

BUT to return to the New York City government: The police department has its Jewish streak in the higher offices—a Jewish police commissioner who has fortunately escaped thus far the full story of his career. The department of health, where it actually touches the people, is Jewish, although occasionally a distinguished non-Jewish name meets the eye in the roster of the higher officials. The public health is becoming more and more a Jewish monopoly in all our cities. The department of accounts, the board of child welfare, the board of inebriety, the municipal service commission, the board of taxes and assessments, are all under the leadership and domination of Jews.

The judiciary becomes increasingly Jewish, litigation is almost overwhelmingly Jewish, and the consequences to the reputation of the courts of justice and the profession of the law are well understood. Real estate exploitation and speculation is strictly Jewish, the profiteers treating even their own co-nationalists with the utmost cruelty.

In short, New York's most influential press (within New York) is the Yiddish press; New York's real government is the Yiddish Kehillah; New York's real administration of the law is the Yiddish administration; New York's real politics is Jewish. A little more, and New York's official language would be the Yiddish dialect.

In all this Tammany Hall is little more than a name; it is one of the rallying centers which the Jews have left the non-Jew who still interests himself in New York politics. There must be rallying places for the non-Jews, and one or two do no hurt. The Jew has the double advantage in such a matter, for while he claims equality with all, he denies equality with any. That is, any Jew proclaims his right to join any fraternity, or any club, or any society, or any party whose members are chiefly non-Jewish; but where is the Jewish fraternity, or club, or society that admits non-Jewish members? The newspapers carried the report, after a certain occurrence, that hundreds of Jews had offered to join the Knights of Columbus! It was very typical of Jewish character. But let any non-Jew attempt to join the B'nai B'rith or the Hebrew Young Men's Association, or the Menorah Society, or any of the others: he will see how far the principle of "equality" operates. "We want to be part of yours, but we want our own for ourselves," is the Jewish attitude.

So, politically, the New York Jew has the advantage. He belongs, together with the non-Jew, to organizations like Tammany or the Republican Club—but the non-Jew cannot with him belong to the Kehillah.

"We Want in; You Keep Out!"

IT IS all so very familiar: the Jew insists on double everywhere. In the Balkans he insists on a double citizenship. He insists on a double protection. He insists on a double standard of education. He insists on all his own religious rights as strenuously as he insists that all Christian majority rights shall be stamped out in this country. He insists that he shall have his Sabbath and that you shall not have yours. He wants his own social rights and yours, too—but he wants you to have only your own and not his with it. It casts serious doubts on Jewish intelligence that this course should be so seriously pursued, as if on the one hand the humor of the "nerve," and on the other hand the disgusting impudence of it, had never appeared to his consciousness.

In New York, therefore, the Jew politically belongs twice, while all non-Jews belong but once, and it can easily be perceived that this is an advantage.

In the previous article it was rehearsed how Tammany besmirched its name by association with Jews who used the organization as a protection for their traffic in vice. This was in 1894. The revelations were so terrible that in any other community they would have led to a complete abolition of any possible chance of recovery, but as it was never made plain to the people that the traffic in vice was not a sudden appearance of rottenness among Americans, but was the normal activity of an alien racial strain, the moral power of exposure was dissipated. The people were left staggered by what they were allowed to believe about the origin of the horror. People said it was Tammany because the press said it was Tammany, and yet people could not understand how it could be Tammany, and so in the midst of hesitancy the fire of reform burned out. It was exactly like these days when we are told that "American business men" abroad are doing terrible things; yet even while the press declares them to be "American" we cannot understand how Americans could do such things—and we never get the key to the matter, nor see the solution, until we stumble on to the fact that these so-called "Americans" are not Americans at all, but alien Jews. Over in Canada the name "American" is becoming a stigma because it is borne by men who are not Americans. What Canadians point out in the United States as definitely "American" is mostly Jewish, but how are the Canadians to know? The national name suffers. The whole cause of evil is camouflaged and a nation pays the price of a racial group's misdeeds. There should be some method of protecting this forging of national names.

Thus Tammany became a synonym for what was not characteristically Tammany at all, but what was characteristically Jewish.

The exposure of 1894 disclosed that vice was really a thing of cold blood. Evil that springs from passion and impulse really amounts to far less than is commonly supposed. It is when passion is deliberately cultivated and impulse stimulated, that the great bulk of the world's social evil occurs. And this stimulation is undertaken in cold blood by those who make profit out of providing the means of gratification—like the old-fashioned bar keepers who served very salty free lunches to stimulate the sale of beer.

This kind of vice is not a thing to be shamed by exposure as can be done with involuntary vice, as it might be called. This cold-blooded merchandising of human weakness was merely a matter of profits, and if business had been interfered with by a Lexow Committee it was rather unfortunate, but good business required that operations be resumed at the earliest possible moment. And so, though the investigations of 1894 were successful and the exposure duly made, it was not to be expected that mere oratory and printer's ink would suffice to keep the serpent down.

Traffic in Hands of Jews

IT WAS only seven years before scandal flamed again throughout the length and breadth of New York, and strangely enough—strange enough in all conscience for "Gentile fronts" of this day and generation to heed!—it was found again that the traffic in evil and its ramifications all over the land, and even to foreign countries, was in the hands of Jews. There was no doubt about it. There was even no accident about it. The fact was as continuous as it was colossal.

William Travers Jerome, then Justice of the Court of Special Sessions, made in 1901 a ringing indictment of conditions in the city and used the full power of his court to punish wrongdoers; he even went so far as to specify individuals and political connections—but he did not mention the key-word of it all, which was "Jew." It was doubtless wise for him that he did not, else he could not have enjoyed the subsequent political career which came to him.

Tammany was defeated in the election of 1901. The defeat was due to the same cause—the stigma of Jew-controlled vice traffic under political protection.

It was at this time that Richard Croker "abdicated." He was a rich man. He sailed for Ireland, where he became a country squire on his Wantage estate.

Public curiosity was fed the statement that Croker had selected Lewis Nixon to be his successor, but this turn in Tammany's career is too important to be thus misstated. The truth is that *when Croker left he surrendered Tammany to the Jews.*

Croker could confirm this if he would talk, if he should be permitted to talk. It is, however, not well to have garrulous old men spilling the secrets of other days. Croker in his age took a bride who is said to be of "Indian descent," and he has not been much in touch with his family nor the public since.

Lewis Nixon was the convenient and perhaps unconscious "Gentile front." The real ruler of Tammany in Croker's stead was Andrew Freedman, mentioned in the former article as Croker's friend and house mate.

With the Passing of Croker

JUDGING from the habit of individual Jews to room with baseball players before the baseball scandal, and the result of another Jew's living with Croker, it might be just as well to keep an eye on those other men who are in positions to do favors or influence legislation, whose close cronies happen to be Jews. Some of these friendships may indeed be perfectly conceived; but there are numerous instances where the plans of the "Jewish friend" are very completely matured through the agency of the "Gentile chum.")

So, upon the departure of Croker from these shores, we find Tammany under the dictatorship of a Jew who was Croker's chief influence, if not his absolute master.

But by the time this occurred, it was useless for Tammany to rebel. Tammany men who had noticed the infiltration of Jews and were alarmed by it had consoled themselves with the thought that, at least, the higher offices were immune from Jewish occupation. This consolation served only to permit the filling of the lower offices by Jews, with less protest from the membership. By the time the Jews were ready to permit Croker to "abdicate," they had permeated every part

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

of the Wigwam and the assumption of supreme control was thus made a simple matter. Croker stepped aside; instantly into his place stepped the Jew, Freedman, operating through Nixon.

It was too late for Tammany to remonstrate. Tammany could not protest against the Wigwam *becoming* Jewish, because the Wigwam already *was* Jewish. To remonstrate then was to ruin Tammany. Becoming reconciled to what seemed to be the inevitable, Tammany leaders saw that their only hope of survival came through preserving Jewish support.

Presently even Nixon was relegated to the background and Freedman issued his orders directly. The Jews, however, with great astuteness continued to make much of Nixon, because he was the last thin veil which concealed the change which had come over Tammany, and he was valuable to that extent. He was, unwillingly, perhaps, their puppet, but even puppets must be accorded their proper dignity. Nixon was tendered a great reception in 1902, but the influential men on the reception committee were mostly Jews: Andrew Freedman was chairman; then followed the names of Oliver H. P. Belmont, Max F. Ihmson, Samuel Untermeyer, Nathan Straus, Randolph Guggenheimer, Henry M. Goldfogle, Herman Joseph, and others.

Names on the Roll

ON THE executive committee of Tammany Hall at this time were Randolph Guggenheimer, Isaac Fromme, Nathan Straus, Henry M. Goldfogle, O. H. P. Belmont, and other Jews.

On the committee on law were Samuel Untermeyer, M. Warlet Platzek, Abraham Levy, Henry W. Unger, Morris Cukor and Fred B. House.

Andrew Freedman had complete control of the committee on finance that was nominally headed by Lewis Nixon.

Randolph Guggenheimer was president of the municipal council.

Ferdinand Levy was on the committee on resolutions and correspondence.

Jews had so spread themselves as to constitute a controlling group in all the assembly districts that were under tribute to Tammany. In the "Fighting Eighth" district, Martin Engel was leader. His chief aid was "Manny" Eichner, chairman of the Isidor Cohn Association and of the Young Men's Democratic Association. His other assistants, Max J. Porges, Max Levein, and Moe Levy were floor managers of the dances and balls of the Florence Sullivan Association.

In the Tenth district, Simon Steingutt, "Mayor of Second Avenue," was one of the hardest workers in Tammany affairs.

Edward Mandell was the active Jewish Tammany man in the Twelfth district.

In the Eighteenth district, Maurice Blumenthal was one of the principal workers. He devoted his career chiefly to the training of Jewish speakers for the Wigwam.

The Eighteenth district was known as "the Gashouse district," notorious for the Gashouse scandals over padded pay rolls, and here Charley Murphy ruled, his aides being Julius Simon, Edward E. Slumasky, Joseph Schlesinger, Leopold Worms, Hugo Siegel, Alfred B. Marx, Nathan Fernbacher, and other Jews.

And so on through the list. Among the Sachems of the Tammany Society there were to be found the wealthier and more socially exalted Jews.

They Go Too Far, as Usual

HOWEVER, the Jews made their cyclically recurring mistakes: they carried things with too high a hand, and rebellion broke out. It is this Jewish tendency to boast and overdo that has always given the game away. Superficial observers and writers like John Spargo and Norman Hapgood have observed the recurrent periods of protest against Jewish presumption and bumptiousness and have explained them as being recurrent spasms of a vile poison which is supposed to reside in the blood of the Gentiles—the vile poison of anti-Semitism. That, of course, is the conventional Jewish propagandist explanation, and Spargo and Hapgood are merely retailing it. They say it always breaks out after wars. Why after wars? Because in wars the world sees more clearly than at other times the real purpose and personality of the Jew. Thus, it is not anti-Semitism that breaks out—it is Semitism, gross and exaggerated Semitism; and the serum which forms in the social body to encist and control the germ of Semitism, comes in the form of public exposure and protest. That serum is working now—the serum of publicity, and the Jewish program cannot endure it. Study the history of all things whatsoever into which Jews inject themselves, from summer resorts to empires, and you see the same cycle appearing.

Thus it happened in Tammany Hall—"too much Jew" engendered revolt. Lewis Nixon became aware of his position. As a gentleman of standing and responsibility he could not continue in a position whose falsity had become clear to him. When he accepted the leadership of Tammany Hall, it was not with a purpose to continue the old order. His understanding was that he was to be left free to restore Tammany to the plane of its former serious purpose and respectable character. He discovered that he was being used as the "respectable Gentile front" behind whose name the Jews expected to carry on the old game. Therefore, in May, 1902, three months after the great reception above mentioned, Nixon resigned as leader of Tammany Hall. Doubtless the reception that was tendered him was for the purpose of inducing him to love the exaltation of his position so much that he would sacrifice its moral obligations.

Nixon accompanied his resignation with a speech in which he protested that ever since he had accepted the leadership of Tammany he had been hampered in his every action by a group headed by Andrew Freedman; they dictated the names that were to be placed on the list of Sachems: "When I rebelled, I found that at every turn I would be opposed by this coterie of interferers; I found that all my important acts had to be viséd before they could become effective." He said he could no longer retain his position and his self-respect, he had to give up one or the other.

Mr. Murphy's Position

WITH this, Mr. Nixon vanished from the scene of Tammany politics.

The resignation of Mr. Nixon had a bad effect on the reputation of Tammany with the public. The plan had been to allow him to serve as long as ordinary and then replace him with a Jew by means of the usual process of selection. But the resignation and the explanation that accompanied it, showing as it did the Jewish influence in Tammany, made it seem inadvisable to follow with a Jewish leader. So, the district leaders were obliged to find another "Gentile front," only this time one who would prove sufficiently docile. There was enough rankling disfavor against the Jews in the old organization to warrant this observance of appearances, at least.

The dictatorship of Freedman was seen to be a failure, much as the dictatorship of Trotzky is seen to be a failure. A rearrangement of committees automatically eliminated him from control, at the same time the name of Croker was dropped. A triumvirate of leaders was chosen, of whom Charles F. Murphy became and remains the chief. "Boss Murphy" he is called. Mr. Murphy has been an ideal "front," not attempting to do anything, not attempting to interfere with the Jews doing anything, keeping wisely silent and thereby gaining a reputation for silent wisdom. Mr. Murphy is a millionaire. Those who do the higher Jewish leaders' bidding get their reward that way; there is no other reward they can hope for; certainly they never have the reward of public confidence and the people's gratitude.

That is the status of Tammany Hall at the present time. A few of the Old Guard are left at their posts, but they are officers in name only. Tammany is no longer denounced by the public press, but the Jewish leaders of Tammany live daily to a chorus of praise in the Jewish-controlled newspapers of New York. Samuel Untermeyer, for example, receives more publicity in New York than does the President of the United States, but it is not discriminating publicity; it does not penetrate to the inner purposes and consequences of his actions.

How Some Have "Arrived"

THOSE who were the lesser Jewish lieutenants of Tammany a few years ago have now arrived at posts of influence and affluence. Morris Cukor was made president of the municipal service commission, to be succeeded by former State Senator Abraham Kaplan. Fred B. House rose to be a city magistrate. The city marshals are mostly Jewish. Jews predominate in the College of the City of New York. Jews control the municipal courts, the city magistrates' courts, the city court, the New York state court of appeals, the New York state supreme court. They rule in the departments enumerated in the fore part of this article. The New York judiciary has a distinctly Semitic complexion.

The leadership of the Tammany-controlled districts tells the same story. In the Second, the leader is M. S. Levine; in the Sixth, David Lazarus; in the Eighth, S. Goldenkranz, F. Bauman and S. Salinger; in the Ninth, Mrs. P. Lau, in the Seventeenth, Nathan Burkan —and so on.

The Jewish conquest of Tammany, however, is only one phase of the conquest of New York. The Jewish objective is more than political. Merely to strive that the lucrative and powerful officers of the city shall fall to their people, is not the end in view. New York has been turned into the Red Center of America. There most of the alien treason carried on against the government of the United States, has its source. The United States Government has been compelled at times to regard New York as almost alien soil, but even that watchfulness on the part of the national government is relaxed as Jewish influence becomes more potent at Washington. Tammany is a convenient cover for ostensible political activity as the Kehillah is for the more radical racial and anti-American racial activity. The United States Government could not do better than to investigate—through a committee of invulnerable Americans—the Jewish activities of that center. And that there is much to investigate is indicated by the rush of Jews to Washington when it was recently proposed in the United States Senate that such a thing be done.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages, respectively, sent to any address upon receipt of 25 cents in stamps for each volume.

JEWISH WORLD NOTES

"Poland's star is waning. Poland is not going to grab Upper Silesia, and if she cannot have Upper Silesia, she cannot have Vilna either. From the Jewish point of view it is of paramount importance that the Poles be not placed in the position of political supremacy in Central Europe . . . . The Upper Silesian problem is a Jewish problem, too, for there are tens of thousands of Jews living in Upper Silesia and for the last twenty or thirty years, Upper Silesian Jewry was actually the intellectual reservoir of German Jewry...Fortunately, English liberalism and foresight still prevail and make it impossible for Poland to lay her hands on Upper Silesia." —Chicago *Jewish Sentinel.*

Sir Stuart Samuel, English Zionist leader and politician, recently arrived in London on his return from Palestine, where he had been visiting his brother, the high commissioner. He was "very reticent" with the reporters, but expressed the personal opinion that "things were settling down" and he regarded the outlook as favorable.

Colonel Young has been dispatched to Palestine by the British Colonial office, specially commissioned to make a detailed investigation of conditions. The announced reinterpretation of the Balfour declaration will be held back until the Colonial Secretary, Winston Churchill, shall have received and studied Colonel Young's report. Meantime, the delegation of Palestinian Arabs now in London is pressing its protest against being turned over to Jewish rule. The anti-Zionist Chicago *Israelite,* in view of the actual situation in the Holy Land, goes so far as to declare: "The dream of an exclusive Jewish political state in Palestine seems to be, for the present at least, not only unattainable, but also undesirable in the interest of the Jews themselves."Sir Herbert Samuel, has now declared the policy of the British control on the immigration question in words that put an end to hopes of a Jewish control and of an open and unguarded door for all Jewish comers. He says, with reference to the Balfour declaration that Palestine is to be made "a national home for the Jewish people," but that this does not mean that "a Jewish government will be set up to rule over the Moslem and Christian majority."

Continuing, Sir Herbert Samuel suggests: "It may be that the translation of the English words into Arabic does not convey their real sense; they mean that the Jews, a people who are scattered throughout the world, but whose hearts are always turned to Palestine, should be enabled to found here their home, and that some among them—within the limits that are fixed by the numbers and interests of the present population—should come to Palestine in order to help by their resources and efforts to develop the country to the advantage of all its inhabitants."

Commenting on this declaration and on "the renewal of Arab assertion and activity" to which it has given rise, the London *Jewish Chronicle* says with some suggestion of the anguished tone:

"The year which has seen our two great political successes—the decisions of the San Remo Conference and the sending of Sir Herbert Samuel to Palestine—has also seen the failure of the Zionists in the Holy Land. That is all, and it is much."

At the ninth session of the advisory council in Jerusalem recently, the high commissioner, Sir Herbert Samuel, informed the members that in order to develop the economic possibilities of the country, the government was prepared to grant certain concessions. The first would be given to a company for the purpose of providing Jaffa and its neighborhood with electric power by means of the Ruthenburg scheme. All concessions, he said, will be conditioned by limitation of profits. Further, no concessions whatever would be granted for the working of minerals or oil. If this keeps on the Jews will lose interest in Palestine.

Christian bishops and Christian laymen of high standing deem it advisable and necessary to come out in our defense. They do not feel that while they are defending the Jews they are actually accusing civilization and are actually charging modern humanity with superstition, malice, narrow-mindedness, ignorance, brutality and savagery. We, of course, have known for some time that modern civilization of which humanity is so proud, may rather be compared to a beautifully made-up face of a rather none too beautiful girl and we knew for some time that not human reason but human passion—and the human passions are always the same—are dominating civilized humanity, but in order not to disturb the traffic we did not say it and we preferred the representatives of the Gentiles to say it. Now they are saying it very often and repeating it aloud. But still there are a great many Gentiles, who invite us to abandon Judaism and to join Christianity, to become civilized. Whenever we receive such an invitation and unfortunately we receive it too often, we must keep on smiling at the naive and innocence of those believers in modern civilization.—Chicago *Jewish Sentinel.*

Bus Boy, Mule Skinner, Senator

Holm O. Bursum Wins Honors Because He Knows and Understands Human Nature

SENATOR HOLM O. BURSUM

He learned much of human nature skinning mules, acting as bus boy and stopping stampedes. He is the junior Senator from New Mexico.

THERE are several ways of learning practical and applied psychology. They are all said to be successful. You may go to college and listen to "high-brow" professors and study Henry James and perhaps find out how to fool the professor when it comes to examination time. Or, you may begin as a bus boy in a frontier town, advance to switchboard operator, and finally qualify as a mule skinner.

While the first is not guaranteed to teach practical human nature as it is known today, the latter is sure to give knowledge and patience and insight that would make a practical postgraduate course of Henry James.

And the man who can guide the destinies—and all in one direction—of eight mules with their super-intelligent and distinctly premeditated aims is assured of being able to guide his fellow men. Mules and humans have much in common when it comes to political, social and industrial life.

Senator Holm O. Bursum, who has recently been appointed by the governor of New Mexico to fill out the unexpired term of Senator Fall, had bequeathed to him a heritage of hard work. He used this heritage to the utmost. Born at Fort Dodge, Iowa, he early went to Colorado and became a bus boy in a restaurant in Denver, known as the "English Kitchen." Washing dishes and acting as general roustabout were a part of the job. His "salary" for this term was the capitalistic sum of $3.50 a month! But out of this amount Bursum was able to save something!

Later on, he graduated to switchboard operator, for which he received $30 a month, out of which he paid his own "keep." But still there were other grades ahead of him in the school that Nature had decreed should be his. Looking around he saw a chance to become boss of a railroad section gang.

He took the job, although it meant rising in the morning at 3 o'clock and a watchful oversight until the sun went down. Such was his progressive life in Colorado until 1881, when he "hit the trail" for New Mexico, which was then a new and little-known territory.

His next grade was that of "mule skinner." He had found out that the contracting business in a new country was profitable, so he hired out driving mules. Continuing to save from the amount he received it was not long before the young man Bursum was able successfully to pilot some eight of these long-eared creatures.

The years spent with the "jerk line" of mule skinning were profitable and valuable ones in the University of Bumps and Initiative, in which Bursum was enrolled for a life course. His major subject was human nature. He learned quickly. For instance, he soon learned that his team of eight when given a chance to rest from pulling through the sand would begin again with alacrity when told to go on. But if they were tired so as themselves to decide to stop, it was one of the labors of Hercules to get them started again. There are many variations to this in humanity.

When the contracting and the mule skinning seemed to be in a more or less permanent slump because of new settlers and new people, he decided to sell off his outfit for sheep. But his stock died and later, in 1893, he went broke. He had the satisfaction of knowing that there were thousands of others in the same position during that memorable year. It seemed as if his savings and life training had been lost, and that he would have to start out anew.

But nothing was ever known long to daunt Senator Holm O. Bursum. He improved his time, every moment that he could; he attended night school, and his leisure hours were spent in reading good books. He studied better, back there, than he knew.

Again, by hard work and thrift he obtained another start. He began to take an active interest in politics in his own state. He soon held important positions because he knew and understood people and knew what they wanted and just what to give them.

From serving in the territorial senate in 1899 he became a national committeeman in 1919. All because he knew people and his judgment was sound. He had been forced to know others, and he probably never would have lived to think of the Sixty-third Congress and its Senate had his knowledge and appreciation of events been faulty.

Holm Bursum spent many a long day and night punching cows and looking after cattle. On two separate occasions he went through all the dangers, the excitement, and the thrill of a crazed and stampeded herd of cattle. It was only because he had learned well his early lessons that he survived.

Perhaps you have watched a stampede of cattle—on the motion picture screen. If it has thrilled you there, when it has all been safely rehearsed at the call of the cameraman—it probably would unnerve you completely to see thousands of wild, reckless and insane cattle charging down on you.

By a thorough knowledge of cattle and their process of reasoning and doing, coupled with a faithful pony, the present Senator was able to emerge from the stampedes with his own life as well as the lives of his stock.

His ponies won other things for him than thrilling races with wild cows. In other days the men of New Mexico and the adjacent states used to race their ponies in what they called, "quarter horses." The runs were about 440 yards.

One time Bursum learned that there was to be a horse race the next day in a town through which he was passing. He decided to stay over and see the fun. The race was won by a pinto pony, whose owner was so delighted with the result that he loudly challenged all others saying, that "his horse could run faster than anything that wore hair."

Bursum, too, was proud of his own little pony and resented the challenge, so the match was arranged. When the race was run it was Bursum's horse that came out ahead, although handicapped with a heavy saddle, while the pinto was ridden bareback. The challenger was not satisfied and demanded another race. Bursum was willing and again won

Senator Bursum is a warm booster of New Mexico and its people, its wide prairies, hills and mountains, for he believes that there is not another state in the Union quite so good. He said of it, "it is a country where opportunity is to be found for the man who plays the game fair. The people there are the sort you can depend on, if you are yourself dependable. Their outlook is broad and human. They are ever willing to help the less fortunate ones if they are really helpless. Their manhood and womanhood are of the highest."

And the Senator ought to know.

Although he has been in the Senate for but a few months he is still the man of action. He does not talk much. Talk, somehow, was never very effective in the early days—deeds counted most. Senator Bursum has kept everylastingly after certain bills for the people of his state, and they will soon become laws. He found that such plugging brought success out in the West—he evidently believes that it has value in the very halls of Congress.

The Senator would easily fit the clothes of the western "cowman." Tall, muscular, strong and resourceful, of athletic build and smooth face, he knows what he wants and generally gets it. He does not carry an ace up his sleeve ready to fool his opponent, neither does he permit the other ones to carry anything up their sleeves.

When Familiarity Breeds Forgetfulness—By E. J. BECK

HAVE you ever had an embarrassing experience like this? You are about to introduce a person you know fairly well to a friend of yours. But just at the crucial moment when you say: "John, allow me to present Mr. . . . ." you find it impossible to finish the sentence and you fail to recall the name that was almost at the tip of your tongue. It is perfectly familiar, but still it eludes you.

The latest psychology explains such a lapse of memory by the principle that we have a tendency to forget the things which have unpleasant associations.

A friend of the writer's studied psychology under Professor James Mark Baldwin at Johns Hopkins University. Recently he went to a book store to buy a publication written by his former professor, but when he was making an inquiry of the clerk about the desired volume he was unable to mention the name of the author until he had concentrated on it for a minute. Being a psychologist, he immediately began analyzing the capriciousness of his mind. He called up his mental associations with the word "Baldwin" to discover which one of them was unpleasant enough to prevent the name from popping instantaneously into his head. His first association was "bald" and then "bald head." He had lost most of the hair on the top of his head; he was self-conscious about his shiny scalp and therefore the familiar name was held back from consciousness by a disagreeable thought connected with it.

Freud mentions a similar case of a traveler who had stopped in a Sicilian village called Castelvetrano. Later he was able to remember the details of his experiences there, but couldn't for the life of him think of the name of the place. After considerable groping he declared the elusive name to be "Castrogiovanni." The last part of the right name, "vetrano" sounded like veteran, which suggested old and age. The man had a horror of old age and about the same time took a friend seriously to task because the latter made the remark, "I am no longer a young man." The "giovanni" in the false name suggested young and youth.

If you have met a man by the name of Brown and he has proved disagreeable to you, you will be handicapped in recalling the names of other Browns because of the association with the name of the person who first aroused your antipathy. If a man with a striking facial feature has incurred your ill will—we'll say he has a red mustache—you probably will find yourself harboring an unreasonable, instinctive aversion against other men with red mustaches. Further acquaintance may cause you to lose your original dislike because other agreeable qualities will counterbalance your first impressions. You will, however, have some difficulty in remembering the names of people thus linked together in your unconscious mind.

Most names are forgotten for the simple reason that we never paid any attention to them in the first place. They went in one ear and out the other. But when we forget people with the most familiar name of all—our own—we may be sure that a hidden complex has blocked the way to consciousness.

Andre Tridon, the New York psycho-analyst, gave an illustration of this. He said: "While in Mexico City I became acquainted with a man bearing my family name, which is one of the rarest in existence. I made several appointments with him, which I never kept, and finally mislaid his address. To this day whenever I recollect my experiences in Mexico, I never think of that Tridon unless I make a special effort and at times, having made the experiment of closing my eyes and visualizing his appearance, I have almost entirely failed. When trying to visualize his printed name, I generally see his first name, Leon, followed by the initial T. The rest of the surname always seems blurred and unreadable. My unconscious mind evidently allows him to enjoy his first name which constitutes no infringement of my ego's pretensions and the letter T, which I share with a million others."

Mr. Tridon's theory is that our ego feels a certain loss when some one else assumes one of the elements of our personality over which we wish to retain a monopoly. He says further: "It is very rarely that a man named Smith enters into a very friendly relation with another Smith."

First impressions are often deceiving because our childish, unconscious mind attaches undue importance to a tone of voice, a color of dress or a personal peculiarity which may have either a pleasant or unpleasant connotation in our memory.

Lapses of memory such as those described may be overcome by self-analysis. When the inhibiting association is ferreted out and brought into the light it loses its obstructive power. When you become aware of the fact that red mustaches give you vague feeling of dislike and cause you to forget an otherwise well-known name, the memory is no longer affected. Self-publicity cuts off the weight that prevents a name from rising to the surface of your stream of consciousness.

When an associate of yours chronically has difficulty in remembering your name or when you have to repeat your name again and again to an acquaintance, you may be sure either that he hates you secretly or that you are innocently linked in his sub-surface memory with some previous, painful experience.

A World Court That Solves Trade Problems

By EDWARD J. DIES

A GONG sounded. Workmen put aside their tools and formed a twisting, muttering line before the pay shanty. Only a month before they had come from distant points to the new oil field which sprawled out over a desolate waste, flanked by low, barren hills. Now they were to be thrown out of work.

It was not a labor dispute. Trouble over commercial rights had arisen between two factions interested in development of the wells. All work must cease until the courts could define these rights. Both sides realized such delay would mean a tremendous financial loss, and that the restive spirit of the men in the empty basin swept by scorching winds might endanger property.

Messages went clattering over telegraph wires. Last minute proposals and counter proposals were flashed back and forth. When it looked as if the gap could not be spanned, that industry must halt and take pot luck with crowded court calendars, one side suggested placing the dispute before the International Trade Court. The other side quickly agreed. Accordingly long telegrams of instruction were sent to opposing counsel in Chicago.

On the very next day the trade court heard the case. Contentions of each side were considered, differences ironed out, and the rights of each established. On the second day a formal decision was given. Papers were signed. Attorneys shook hands. Telegrams were flashed back to the oil field, and on the third day after operations had ceased the gong sent all workmen back to the job.

There had been no clumsy legal procedure, no lengthy continuances, no verbal barrage on the fine points of law. A court jury trial that might have stretched over months had been avoided. Without serious interruption to industry a settlement had been reached.

It was one of more than 200 commercial disputes settled in four months by the first International Court of Commercial Arbitration.

This court, which sits continuously, is attracting world-wide attention. In a single week a dozen towns in Mexico and six in South America asked permission to use the court's facilities, while commercial bodies in New York, Philadelphia, Washington, San Francisco and Minneapolis sought information with a view to establishing similar tribunals or directing litigants to the Chicago court.

Chambers of the trade court consist of a modest suite of business offices half way up a skyscraper. J. Kent Greene, for 13 years assistant to the chief justice of the Chicago municipal court, directs the trade court. Long ago he visualized its value to the commercial world.

"Commercial arbitration," says Mr. Greene, "means commercial success. Under America's cumbersome court methods England could not have maintained her commercial supremacy. Arbitration is the secret of her commercial success.

"Ninety-five per cent of England's trade disputes never go to court. They are tried before arbitrators. In all England there are only 23 judges. In Chicago alone there are 73. A glance at our crowded court calendars will drive home the urgent need of trade courts in America."

Justice is placed ahead of technicality by the court, whose jurisdiction is defined under the Illinois Arbitration and Awards Act. Its speed may be reckoned when it is considered that Mr. Greene alone can handle twice as many cases as one judge without a jury, and 10 times as many as a court with a jury. This is due in a measure to the elimination of "hear ye, hear ye"; "if the court pleases we will introduce" a bushel basket of evidence one page at a time, and all the other frills that go to make up the law court.

By calling in its reserves—business men, trade experts and attorneys who have agreed to serve—the trade court can be quickly expanded to almost any size. If necessary it could handle every civil action coming up in Chicago.

Jurisdiction is world wide. A diamond miner in South Africa whose claim is disputed by a jeweler in Medicine Hat, Alberta, may have the case adjudicated in Chicago, even though the precious stones never passed through the United States. Only the agreement of the two parties to arbitrate is necessary.

A Baltimore exporter and a Chicago manufacturer may submit their cases and go on about their business. If necessary the court will gravitate between the two cities, gathering evidence and testimony. Neither party to the conference is forced to appear as a witness in open court. This prevents the revealing of important trade secrets and dissemination of objectional publicity that frequently involves financial loss and business disturbance.

When two parties submit their controversy to the court—which has authority to try any civil action except divorce cases and those that are quasi criminal, in which the public has an interest—Mr. Greene is automatically appointed arbitrator. But the parties may also select additional arbitrators from their respective trades or from a list of attorneys and commercial experts provided by the arbitration bureau.

After this selection the procedure is directed by the arbitrator. The trade court may administer oaths, subpena and examine witnesses, take depositions and issue subpenas *duces tecum* requiring production of documents. Obedience is enforced by application to court.

The arbitrator often inspects premises, examines goods in process of manufacture and, moving quickly from place to place, in a few days gathers evidence which immobile courts would be months in obtaining under the handicap of red tape.

When arguments have been heard the arbitrator gives his decision covering the entire controversy. If a demand has been made for money that is due, the award will fix the amount to be paid. The award may order a litigant to perform certain acts to comply with a contract; it may interpret a contract that has been altered by unexpected developments; or it may map out the procedure of parties before money is hazarded on a dubious venture.

Frequently the award defines rights of both parties under a contract where no right of action has yet accrued. In such cases a court of law could not entertain an ordinary suit until damages had accumulated through breach of contract.

All questions of law and of fact are decided. Conclusions of fact are final. Questions of law may be revised by the court selected by the litigants. As in any other case, an appeal may be made to the appellate or supreme court to review the conclusions of the arbitrator and the lower court on questions of law. In event the arbitrator has erred in law he will be directed how to proceed in making his award strictly legal.

When the final award is filed in court, the court has jurisdiction over the litigants. Therefore the trade court is quasi judicial and quasi public in character.

Should a party to arbitration fail to comply with an award, the opposing party may within a year file the award in court. Judgment can be obtained and then contempt of court proceedings begun if there is still a refusal to comply with court instructions.

Best proof of the high efficiency of the trade court lies in the fact that of the first 200 cases decided only two were carried further. One of these was to clear up a legal technicality.

This almost unprecedented record is due largely to the fact that competent advisers take the place of the law court jurors picked from the street and usually unskilled in the intricate problems of commerce. Decisions are given with the dispatch that marks the conclusions of directors of any well-conducted business.

Elimination of the law court jury also eliminates local prejudice. The New York or San Francisco man whose case against a Chicago man is tried before a Chicago jury may meet with prejudice. The same applies to any other city. Local pride and sympathy for the fellow citizen will tend to sway a jury. But a trade court, with an international reputation to maintain, must be guided solely by cold facts.

The enmity that springs up between litigants who must reveal their secrets in open court also is avoided. Records show that in 90 per cent of the cases tried the disputants have come to friendly terms. The non-publicity feature helps to bring about this harmony. In law courts unfavorable publicity against one side or the other is sometimes brought about by the introduction of skillfully chosen evidence. In the trade court such a course is impossible.

J. KENT GREENE,

Manager of the first International Court of Commercial Arbitration. The court will save millions of dollars annually to American industry.

When the trade court was established, after the law on which it is operative was held constitutional by the state supreme court, strenuous opposition was offered by some attorneys and judges. They deemed it an encroachment on their rightful domains.

But this antagonism quickly disappeared. In a short time the court had fully justified its existence and made clear its peculiar field. It has proved a distinct aid to the courts—many of which are more than a year behind—and attorneys say it relieves them of protracted court calls, unprofitable delays, and affords them opportunities to serve in cases requiring legal and industrial training.

Fees charged are almost negligible when compared with the cost of settling the average commercial dispute in a law court. Where the amount involved is as small as $200 the fee is $5. There is a graduated scale up to $5,000. Where more than $5,000 is involved the fee is one per cent of the total sum. Fees are paid by the unsuccessful party to the Chicago Association of Commerce, which brought about the trade court and which pays the salary of Mr. Greene as court manager. He is the only paid employe. He receives no part of fees collected.

Commercial leaders say that in Chicago alone the trade court will save millions of dollars a year for industry by the quick, effective handling of commercial disputes. The saving to other cities and other countries which are already taking advantage of the facilities offered will be tremendous.

So the first International Trade Court is being hailed as a forward stride in American industry.

Money Is Not Capital

THERE are only two factors in the production of wealth, capital and labor. These factors are entitled to all the credit and profit arising from the creation of wealth.

Does money have any right to participate in these earnings? In other words, is money capital? We think it is not. Should there be any doubt on the subject the assurance of accepted masters in political economy will be helpful. Their definitions of capital are as follows:

"That part of a man's stock which he expects to afford him a revenue is called his capital."—Wealth of Nations, book II, ch. I; Adam Smith.

"Capital is that part of the wealth of a country which is employed in production, and consists of food, clothing, tools, raw material, machinery, and so on, necessary to give effect to labor."—Principles of Political Economy, ch. V; Ricardo.

"The capital of a nation really comprises all those portions of the produce of industry existing in it that may be directly employed either to support human existence or to facilitate production."—Notes on Wealth of Nations, book II, ch. I; McCullough.

"Whatever things are destined to supply productive labor with the shelter, protection, tools and materials which the work requires, and to feed and otherwise maintain the labor during the process are capital."—Principles of Political Economy, book I, ch. IV; John Stuart Mill.

"The common sense of the term is that of wealth devoted to procuring more wealth."—Progress and Poverty, book I, ch. II; Henry George.

It appears from these definitions that capital must, as an essential fact, be a part of wealth, as Henry George, in his Progress and Poverty, book I, ch. I, so aptly expresses it; "Now, as capital is wealth devoted to a certain purpose, nothing can be capital which does not fall within this definition of wealth," and further, on the same page, "But though all capital is wealth, all wealth is not capital. Capital is only a part of wealth—that part, namely, which is devoted to the aid of production."

It is evident then that for money to be capital it also must be wealth. That it is neither, we have but to consult that eminent authority, John Stuart Mill, who says in his Principles of Political Economy, book I, ch. IV, sec. I: "Money is no more synonymous with capital than it is with wealth. Money cannot in itself perform any part of the office of capital, since it can afford no assistance to production. To do this it must be exchanged for other things."

"First of all we must not make the mistake of confusing money with wealth. We have seen that wealth is different from and bigger than money. Yet it is astonishing how easy it is to forget this simple fact." Why the Dollar is Shrinking, ch. II, page 15; Irving Fisher.

The great truth that money is not wealth, and hence cannot become capital, is rapidly gaining ground, and it will impress itself more and more as the world realizes the colossal wrongs money has committed, and still commits, in the name of capital.

As the exchange of commodities becomes wider and more complex, the more is money thus abused; the results of this abuse become more and more manifest till the centers of population and complexities in exchange are reached. Here we are confronted with conditions which have perplexed philosophers from time immemorial, the disgusting wealth of the few and pitiable misery and poverty of the many; and this in the midst of plenty, and in a day when the powers of production were never greater.

A great many theories, as to the cause of this condition, have been advanced; but we are constrained to believe that the abuse of money, by thus permitting it to usurp the function of capital, is the most virulent and active poison, and is by far the greatest cause of the diseased condition of the industrial world.

Good Roads and Their Influence on Life

Improved Highways Play Big Part in Business and Social Activities; Government's Place in the Building Program

By T. H. MACDONALD

Chief of the Bureau of Public Roads

THE extent to which transportation influences the lives and well-being of everyone is rarely appreciated. Each of us for his own needs requires transportation facilities and services in our everyday movements, both of social and business character, and for the carrying of commodities which we produce, handle in trade or which we consume. If transportation is easily accessible and reasonable in price, our use of it increases. As transportation becomes more difficult to procure and higher priced, we economize more in its use, and if it is unsatisfactory in character we limit our use to the more necessary purposes. These transportation services are rendered direct to the individual and we are necessarily in daily contact with them. Yet we seldom heed this influence until there is a disturbance or change which limits or makes impossible our ordinary use, or increases the cost of the transportation services to which we have accustomed ourselves.

How vitally the element of transportation can affect a whole nation is repeatedly shown in conditions which exist today. Take, for example, the famine conditions in China. These are not due to a lack of transportation facilities primarily, for continued drought is the immediate cause. But there is grain in different parts of that country which could be used to relieve the suffering were it possible to get it to the provinces affected. Inadequacy of transportation facilities is responsible for much of the suffering from lack of food.

Transportation Badly Needed

TURNING to other countries, recent travelers returned from Russia state that reconstruction there is largely dependent on improved transportation. In Central and Eastern Europe the small, recently carved out countries like Czecho-Slovakia, Hungary as separated from Austria and Austria itself, are all suffering from the lack of transportation. To let a car stray ver the borderland is to lose it. The other country will keep it as its own property. Trains are stopped at the border and unloaded. This means that supplies in transit must be reloaded at each border. These conditions still exist, so that if the peasants produce sufficient food for everybody and have more than sufficient for themselves it is impossible to get the food to the cities.

In this country, with its system of railroads already developed far beyond that of any other country, we have recently added nearly 9,000,000 motor vehicles capable of going anywhere serviceable roads were provided, and of bringing transportation to the very door of every man in the city or in the country. But there is this requirement—that serviceable highways be provided.

The growth of the motor vehicle has been amazing. The principal development has taken place during the period from 1914 to the present. During this period we have increased our registration of motor vehicles by more than 1,000,000 annually. Almost nine-tenths of all the motor vehicles in the world are in use in the United States. Thus we have in this country ready at hand to our use the greatest system of railroads and the greatest number of motor vehicles of any nation, but our fortunate condition with respect to these available means should not blind us to the necessity for ever increasing their efficiency and adding to their usefulness.

The usefulness of the motor vehicle in furnishing ample transportation facilities when adequate highways are provided has been so well demonstrated as to be unquestioned.

Trucks Performing Big Service

MOST interesting in character are the uses of the highways by the trucks. For example, the trucks hauling from the farm to market carry loads of garden truck, fruits, cereals, feed, cotton, meat and live stock, dairy products, poultry and eggs, honey and bee products and fuel wood. Hauling away from the market the trucks carry groceries, provisions and general merchandise, dry goods and laundry, house furnishings, building materials and machinery, seed and nursery stock, ice, gasoline, oil and general freight of all kinds.

Although in some sections there is still a very considerable traffic by horse-drawn vehicles, it is not an uncommon thing now for our highways to carry as many as from 8,000 to 10,000 motor vehicles in a single day. Outside the larger centers of population it is a very common thing even out in the agricultural districts—along what might be called county-seat highways—to carry from 1,000 to 2,000 vehicles a day.

The use of the highways made for the transportation of commodities is not so important nor so influential, however, on the life of the communities as the use of the highways by the people in their business and social activities. The latest development is the interurban and suburban bus line carrying passengers on regular daily schedules.

A factor of great influence in bringing about the marked improvement in highway transportation facilities which has characterized the last half decade has been the effective aid given by the Federal Government. The magnitude of this aid may be more fully realized if one considers that in the United States there are 2,478,552 miles of public rural roads and more than 300,000 miles of surfaced roads.

In passing the Federal Aid Act of 1916, Congress laid down a policy radically different from that which had governed the United States in its attitude toward the highways of the country for a century preceding. By the habit of 100 years the highways were regarded as the sole concern of the states and their subdivisions. Under the principle of local self-government the original jurisdiction was lodged in the smallest units, and many of our state constitutions specifically forbade the states to meddle in these affairs which the locality considered as its own special province. But for some years there had been a drift toward state control, and those states which had advanced furthest in that direction had accomplished most in improving the well-nigh hopeless condition to which a century of local mismanagement had brought the country roads.

The Federal Aid Act recognized the success of state administration and built on it a plan of Federal and state co-operation designed to encourage highway improvement and to bring about the adoption of the successful principle of state control by all the states. In the five years since its passage both these primary objects of the act have been accomplished. Every state now has a special department of the state government whose duty it is to provide for the building and upkeep of state highways.

Where a decade since the suggestion of scientific, systematic highway construction met with skepticism and doubt, there is now confidence and a determination to improve the means of transportation by applying the tested principles of modern highway engineering. States have found their people the more willing to invest their money as the value of the investment in public roads has been demonstrated, and thousands upon thousands of skeptics in communities all over this broad land have been converted into ardent supporters of good roads.

Frankly an experiment in the beginning, with no precedent to guide its course, Federal aid has become an accepted principle which is likely never to be abandoned. By complete co-operation between the states and the Federal Government, 25,447 miles of Federal aid road have already been placed under construction, of which 3,803 miles have entirely been completed and paid for.

Nearly Half Billion for Roads

IT IS interesting to note that the total estimated cost of the projects which have been placed under construction is $433,907,746, and of that amount $185,376,462 is Federal aid. That is equivalent to a government participation of 42 or 43 per cent. Of course, there is a certain amount of variation from year to year, but there has been a tendency for the states to ask for co-operation approaching more nearly the 50 per cent limit.

The administration of the Federal Act has pointed out, however, certain problems of a major character. One of these which should be remedied at once is the failure of a large group of states to provide state revenues, as such, to meet the Federal funds. About one-third of the states are in this category. Some of these have been limited, through constitutional inhibitions on their power to raise revenues for internal improvements.

This influence has not yet seriously affected the logical development of the most important state highways, only because the roads in the different communities which are of the largest importance from the state viewpoint have also been of major importance to their respective localities. This being true, great progress has been made even in the states having no state revenues, on the development of state and interstate systems. But to be of state and nation-wide service, the improvement of the system must go forward in the communities which can ill afford the expense of main line highways.

A study of the states shows that interposed between the wealthier communities are those which, although devoting a greater proportion of their wealth to highway improvement, cannot in fairness be required to continue main line highways to complete the state and interstate systems. Only from state and Federal funds can the development of such systems be assured.

Nationally we are in a transition and reconstruction period from many causes, and as is to be expected, the highway question is one of those acutely affected by these changing conditions. The highway engineer and the highway administrator are not guaranteed a safe passage through smooth waters, after avoiding the Scylla of a single problem on the one side or the Charybdis of some other problem on the other. In the development of the highway program in this nation there is involved not *one*, but a large number of major problems, so extensive that they will constantly demand very large expenditures and the allocation of a great amount of labor and materials to this purpose by the public as a whole, in return for highway service, rendered primarily to the individual, but collectively, to itself.

The highway problems which are of an engineering nature are capable of solution if adequately attacked; those which are economic are also capable of solution, but in principle rather than in detail. The application will need always to be localized. Of these two classes —certainly not minimizing either—the most immediately serious are economic rather than engineering, and of the economic problems the determination of the amount and character of service which is to be required from the highways is the most important.

Only in a few of the more advanced states does an adequate conception exist as to the traffic—present and prospective—which must be carried over the highways. The character and amount of traffic which the highways must carry can, through painstaking studies, be reasonably determined. Such a study should precede the settling of the second problem, which is of immediate importance; that is, the mileage rate of improvement. For example, let it be determined within any state that only the high-class, heavy duty pavements will be constructed, and automatically the rate of progress has been fixed. There are now two distinct theories of improvement. First, the one which seeks to extend a comparatively limited mileage of high-class roads annually as fast as the funds and available material and labor will permit. Second, the one which seeks to build a comparatively large mileage of highways to a usable condition in the shortest time possible. This second theory automatically determines that a large percentage of such mileage will be of the lower cost roads with their well-known traffic limitations.

Classifying the Roads

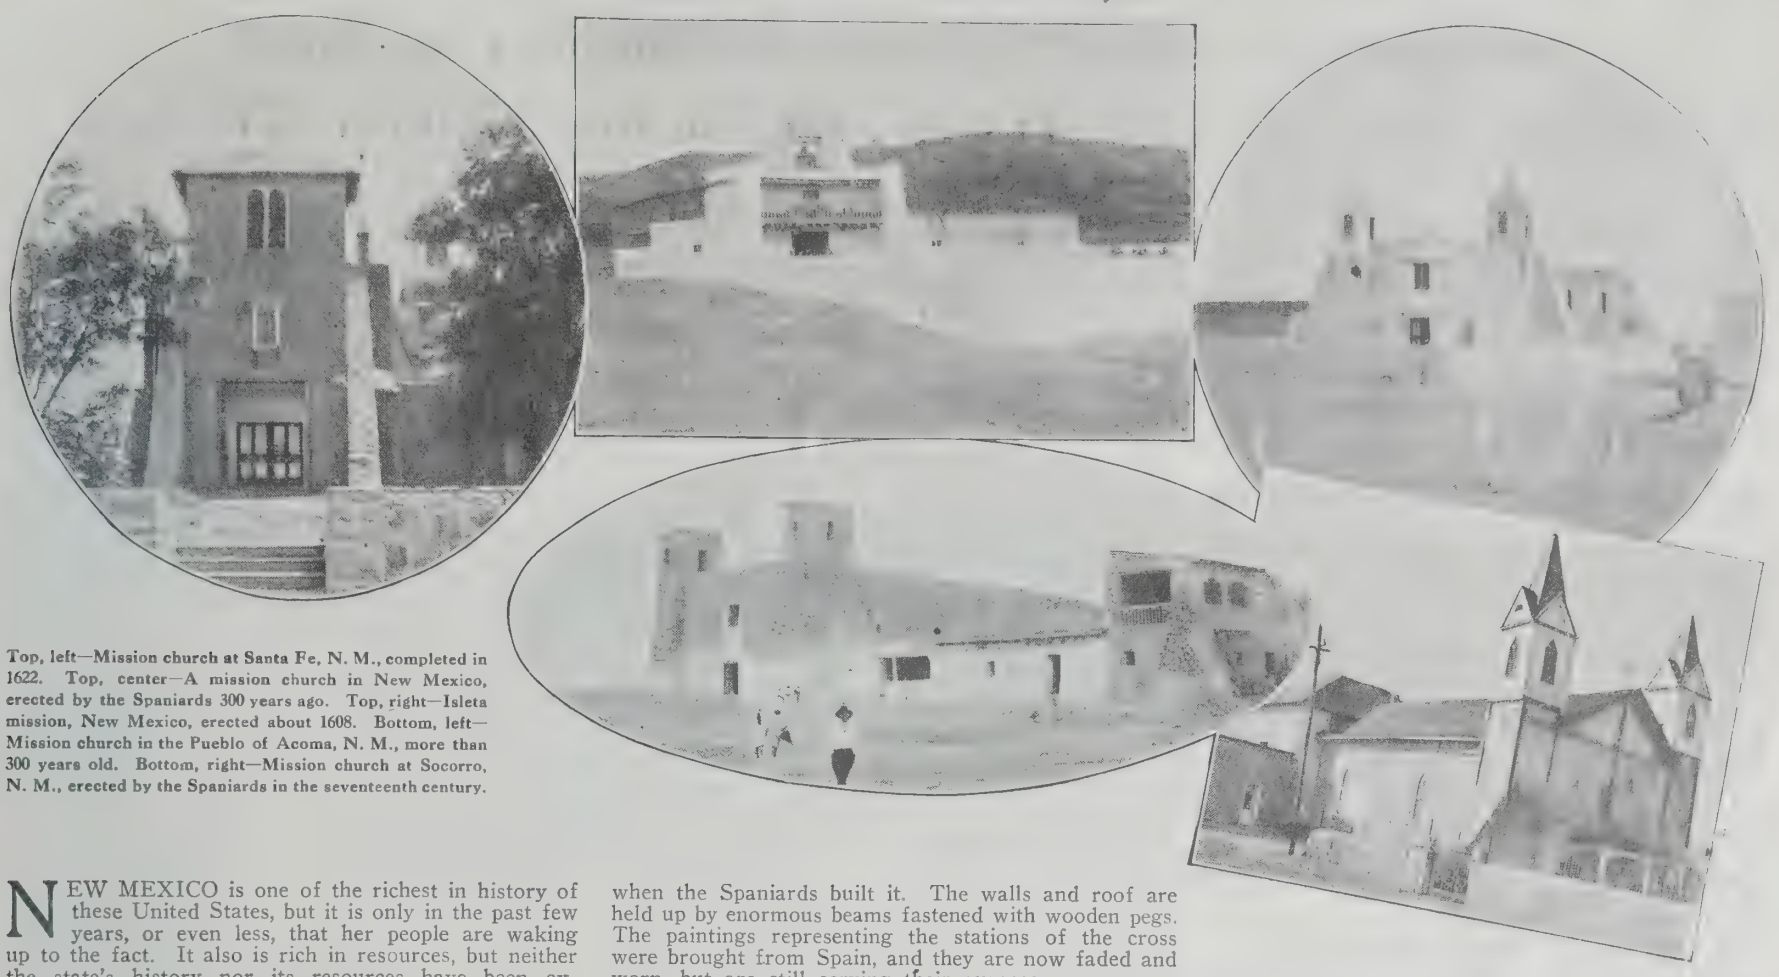
WITHOUT, however, setting up definite requirements of construction or stipulating that roads of a certain type or types only shall be constructed, it has been and it will be necessary to apply more fundamental considerations to determine the adequacy of roads proposed by the states as Federal aid projects. The considerations applied in determining whether a particular project is adequate and of a substantial type may be grouped under four general classes.

The first class refers to traffic, and under this heading each project is considered with respect to (a) the amount of traffic at present using the road; (b) the nature of the present traffic, with special reference to the amount of heavy trucking, and (c) the probable future traffic which will use the road after improvement.

The second group has to do with (a) the type of adjacent roads, and (b) the relation of the proposed road to the state road system.

The elements of the third group are (a) the quality and kind of local materials available for construction; (b) peculiar local conditions affecting construction, and (c) prevailing practice in highway construction in the state or locality.

The last group of considerations is of a more technical nature and is at the present time confined to the results of experiments and studies made by the bureau and believed to be applicable to a greater or less extent in determining the substantial nature of proposed pavements.



Taken as a whole, I think that a fair appraisal of what has been accomplished already will stamp the public roads program as a successful experiment, although I should not like to give the impression that the plan as it is now established is not susceptible to further improvement.

Must Be Part of State Highways

UNDER the present law the government requires that roads proposed for Federal assistance be parts of a definite system of state highways. There have been few cases in which this requirement has been waived, but in a number of the states the systems as adopted are more extensive than they should be and include many roads which can hardly be considered as of sufficient importance to warrant Federal aid in their construction.

Summarizing the general highway situation, it would appear that first, there is an insistent demand for better highways, which has resulted in the appropriation of enormous sums for highway construction; second, that this demand should be met by the prompt construction of serviceable highways as rapidly as possible; third, that there are difficulties to be met in transportation, labor, materials and construction organizations which must be solved or the construction program will defeat itself by developing unreasonable prices, and finally, that the solution of the problem lies in the selection of types of construction which will throw the least possible strain on the weak points. If this is done, it is confidently believed that even higher rates of highway construction can be attempted with safety and with every assurance of success.

The Ancient Spanish Missions of New Mexico

Top, left—Mission church at Santa Fe, N. M., completed in 1622. Top, center—A mission church in New Mexico, erected by the Spaniards 300 years ago. Top, right—Isleta mission, New Mexico, erected about 1608. Bottom, left—Mission church in the Pueblo of Acoma, N. M., more than 300 years old. Bottom, right—Mission church at Socorro, N. M., erected by the Spaniards in the seventeenth century.

NEW MEXICO is one of the richest in history of these United States, but it is only in the past few years, or even less, that her people are waking up to the fact. It also is rich in resources, but neither the state's history nor its resources have been exploited. A few months ago, however, a state Chamber of Commerce was organized, and one of its chief objects will be to let the rest of the country know that New Mexico is in the United States and to advertise its history and its resources.

Only recently the more progressive business men of the state realized that a grievous error was being made by erasing signs of antiquity in its buildings. The ancient adobe stores and mission churches in the older towns were being modernized at a rapid rate, until it was discovered that the charm of these old buildings was lost in their modern dress, so it is altogether likely that there won't be much more modernizing.

The majority of the mission churches, notably in the Rio Grande valley, were erected by the Spaniards when they came up through Old Mexico and into New Mexico more than 300 years ago and conquered the Indians. They converted the Indians, and every Indian pueblo has its mission, or church, some of which were erected as far back as 1608. It is true the Indians turned on the first missionaries after they had been converted and slew them, but more returned and established peace once more, and the great majority of pueblo Indians have remained true to the Catholic faith ever since.

In many instances the old missions have been robbed of their antiquity through the placing of modern roofs on them, also in building façades in front, but in the pueblos, the missions remain almost in the same state they were 300 years ago, except that the walls are much thicker, for which there is an interesting explanation.

Take the mission at Isleta, near Albuquerque, for instance. The walls of this mission were originally one adobe in thickness. An adobe block is perhaps three times as wide as a brick. Now the walls are five feet in thickness.

This mission, like the others throughout the state, is the center of activities during every fiesta. The Indians like to see the mission looking well, so they "doll" up the exterior. They plaster it with fresh adobe, or in plain English, mud, for each fiesta. It is put on over the old coating each time, because the latter can't be scraped off like paint. This has been going on for ages, with the result that the walls have reached their present gigantic thickness. The same thing would happen to a frame or brick house if it were painted several times a year for 300 years, provided the old paint was not scraped off. But the adobe, or mud, used on the missions isn't black. It is of a dark, brownish hue when first applied, but it becomes lighter as it dries, until it attains nearly the color of whitewash. And it does stick where it is put.

The Isleta mission, and the pueblo itself for that matter, draws many visitors. It always is possible to get inside the mission and saunter through the rectory grounds adjoining it. The only grass or anything else green in the pueblo proper is to be seen in the rectory grounds. There the aged Spanish-American priest has peacocks, pheasants, pigeons, chickens, rabbits and a dog.

It was the former custom of the Indians to bury their dead under the mission floor, but every foot of space there now is filled. It is believed the remains of 150 Indians rest there. After the space beneath the mission became filled, the Indians began burying their dead in the mission yard, which is surrounded by a very thick adobe wall. This ground became so crowded that the authorities put a stop to burials there, and now the Indians have a little cemetery on a hillside adjoining the pueblo.

The interior of the mission is exactly the same as when the Spaniards built it. The walls and roof are held up by enormous beams fastened with wooden pegs. The paintings representing the stations of the cross were brought from Spain, and they are now faded and worn, but are still serving their purpose.

There are only two or three pews in the mission. There also are a few benches without backs. The Indian worshipers seem to prefer squatting on the floor during services.

St. Augustine is the patron saint of Isleta, and a statue of the saint always has the place of honor during fiestas. The mission bell rings continuously all the time the statue is out. Some times the statue is borrowed for a wedding or other celebration, to bring luck, and the mission bell never ceases tolling until the statue is safely on its pedestal in the mission again.

Of course, the same beliefs and customs prevail in the other Indian pueblos, but in the towns populated by Americans and Spanish-Americans there are none of these harmless superstitions, though they do have their fiestas.

The mission church in the pueblo of Acoma is as interesting as the others. Its walls are ten feet thick from repeated coats of adobe. This building was erected on a table rock 350 feet above the plain, which means it was a laborious job for the Spaniards and their Indian helpers, because adobe blocks weigh considerable, and they had to be carried to the top of the rock.

Considering the quaintness and historical aspects of these old missions, it isn't any wonder that the people of New Mexico are at last alive to the asset they have and are taking active steps to preserve the antiquity of the structures.

An Interesting Analogy

By FREDERICK R. BURCH

THE producing and commercial world of today is an exact replica of a steam plant, such as now furnishes power to carry on the various industries of the world. Let us select a great ocean liner, as she steams forth upon the sea (of commerce) to perform her functions in the world's activities.

The safe transport of ship and cargo from port to port, from producer to consumer, is the task to be performed. Her engine is the capital, and the steam in the boilers is the labor with which this is to be accomplished.

These forces, standing separately, are powerless. To get results there must be devised a medium of exchange, a method by which these two forces may be economically united. This link is easy of discernment and simple in construction. A comparatively small pipe, known as the steam line (the medium of exchange) connects the boilers with the engine, and the passage of the steam through this line is controlled by a valve therein called a throttle (the banks).

Thus the enormous energy in the boilers and immense capabilities of the engine will become efficient, both as to time and quantity, at the will of the engineer (the banker). The engineer can, with the slightest effort, permit that vessel to be propelled by thousands of horse power, or with very few, or shut off the power entirely. This by virtue of the fact that he has control of the medium of exchange.

During these various changes the volume of energy in the boilers has not diminished; in fact, it increases to a point of danger, averted only by a safety valve. The capabilities of the engine remain intact, but their efficient co-operation has been rendered impossible by the closing of the steam line.

In the meantime, the vessel, thus rendered helpless, drifts helplessly toward the tumultuous seas of the shoals of bankruptcy. The captain and owners of the vessel are horror-stricken. The impending disaster to their enterprise has unnerved them. They apply to the engineer for relief. He tells them that the cause of the condition is that he has become timid, as the boat had been running along too smoothly. He also could ascribe the difficulty to the fact that some one had been "meddling with his business," or "tinkering with the tariff."

Their supplications are in vain. The engineer remains obdurate. One by one they are devoured by that tempestuous sea of bankruptcy and no one remains but the engineer and his minions, who have played the heroic part of the boy who "stood on the burning deck." Yet, unlike the boy, they knew they were masters of the situation at all times.

They are now owners of the entire enterprise. The time to act has arrived. The engineer, by a slight turn of the wrist, opens the throttle, thus permitting the medium of exchange to perform its function; labor and capital again unite, the great vessel steers for the open sea and comes proudly into port, bedecked from topmost peak to water line with flags fashioned from the front pages of the daily editions of a subservient press, each bearing a legend proclaiming the return of prosperity.

We, the people, go home, bolt our simple dinners, and hasten down to the opera house to hear our Congressman tell us about what he did to bring these glorious events to pass, and how fortunate we are to have an engineer of such sterling and transcendent qualities in our midst.

This picture is too beautiful to mar. Let us not sully our memory by any reference to the host of black and bloated remains that are, at this instant, being ruthlessly tossed about out there on those boisterous shoals of bankruptcy, the innocent victims of the engineer's groundless timidity or lack of confidence. Let us draw the veil.

Until sufficient of the thinking people of the world see and understand the incontrovertible analogy which exists between the open sea of the foregoing illustration and the sea of commerce; the vessel sailing the open sea and a business enterprise; the boiler and engine of the vessel and labor and capital; the steam line and money; the throttle and bank; and the engineer and banker; we will continue to take our text from the daily press, our modern gospel, and listen to the sermons of Congressmen, our modern preachers, and, being thus at peace with ourselves and our modern god (of Mammon), we will promptly proceed to outfit another vessel and send her forth in high glee, and the best of cheer, with the same old engineer in complete command of the same old throttle, and, although we cannot bring ourselves to believe it, we may well expect to have the same old results.

Playing Politics With the Panama Canal

Tolls Question Injects Whole Problem Into Partisan Realm

By A. R. PINCI

AFTER many disconnected circuitous attempts, the great Panama Canal tolls problem will be *once more* solved by the Senate of the United States. Once more is said advisedly, because theoretically, more than a century ago, and actually, during the last two decades, the subject has been considered and debated from every angle.

From the time that Secretary Clay drafted the first official American note about the projected canal in 1825 to the present day, when notable Americans are divided in opinion, the exact status, of the United States in relation to its own authority over first the projected and thence the completed canal, has been argued and discussed. The net result is that beyond injecting the entire problem into the realm of partisan politics, sometimes concealed by solemn international law interpretations, the true owners of the Panama Canal —the American people—do not know very much about it except that they have paid its bill through the United States Treasury.

Because the platform of the Republican party has given to the administration a mandate, so to speak, to restore the free tolls privilege to American coastwise vessels using the Panama Canal, there is a growing feeling that whatever the action of the Senate on Senator Borah's bill it will be in response to political urge rather than to sound international thought. Of course, it is unthinkable—even though such things have happened—that the Senate would at this critical post-war juncture lend itself to political maneuvering, but it cannot be denied that all activity in behalf of the bill is looked on in variants of political scheming. Not only is the problem considered a standing major difference between the Republican and Democratic parties, but it has served, and still seems to serve, the purposes of the so-called agrarian bloc, the transcontinental railroads, and similar geographical or industrial groups.

Afraid of Offending Britain

HOVERING in the background, like a Damoclean sword over Uncle Sam's head, there has been the constant shadow of what is termed "friction with Britain." In certain quarters it has become the fashion to regard proper and independent action by the United States over the Panama Canal properties as somewhat of a *casus belli*, with England as the offended party.

Discussing the problem in elementary English, there are two groups; those who believe that the United States has absolute and sole authority over the canal and its regulation, an authority traceable not only to ownership but the perpetual assumption of its fixed charges of maintenance, and those who believe that certain treaties, especially with England, deny this right, and that, to all intents and purposes, the construction of the canal must stand as an altruistic gift to the world.

The latter group, which includes such Republicans as Elihu Root and George W. Wickersham, both prominent in the Roosevelt-Taft administrations, fall back for their attitude on the Clayton-Bulwer treaty and the Hay-Pauncefote treaty of more recent times, as well as a mass of official correspondence throughout 100 years. They and their co-believers assume that any action by the United States which would be contrary to the terms of existing treaties and agreements would involve this country in technical diplomatic difficulties. The opposing group, however, points to vague and indeterminate language in all treaties and correspondence, and interprets a contrary view.

Inasmuch as great lawyers, in the present cabinet and in past cabinets, in this Congress and in past Congresses, have interpreted all available references in roughly two specific sides, without regard to politics, although the parties have assumed a definite stand, the approaching Senate decision makes it pertinent to examine certain new phases which, surprising as it may seem, practically should eliminate all treaties from the discussion.

Every treaty and agreement based on a projected or actual Panama Canal is contrary to the word and spirit of the Monroe Doctrine. The United States cannot, personal wishes to the contrary nothwithstanding, observe the Monroe Doctrine and the Panama Canal treaties at the same time. The Panama Canal treaties are inconsistent with the Monroe Doctrine.

Can't Conflict With Monroe Doctrine

THE Monroe Doctrine dates from a declaration of December 2, 1823, by Presdent Monroe. This declaration antecedes by one year the first formal American proposal for the construction of a canal through Nicaragua. President Wilson in 1915 rededicated the principles of Monroe's all-American policy, and so ineradicable are those principles that four years later they were sufficient to clash with and defeat the League of Nations. From this it may be deduced that the Monroe Doctrine is the corner stone of Amreican foreign policies, and that all subsequent treaties and agreements must not conflict with the Monroe Doctrine—and that cannot be said to be the case with, barring a certain technicality, the Clayton-Bulwer and Hay-Pauncefote treaties.

The Monroe Doctrine denied the right of foreign powers to interfere with self-determination by the various Latin-American republics. As fast as each European colony in southern or central America freed itself of its yoke the rejected nation would not be permitted, by force or other means, to restore its influence. This is simple and understood by all.

But the Monroe Doctrine, however, operates both ways—a fact that is not understood nor appreciated by many pro-treaty champions of the Panama Canal problem. Inasmuch as the Monroe Doctrine denied the right of European governments to perpetuate themselves or their territories in the Americas, it denied the right, obviously, of the United States to engage in any undertaking or understanding in that territory in conjunction with any foreign power. Moreover, as it is admitted that Latin-Americans may not be permitted to seek or invite foreign dominion of any kind, or to recall that which they rejected, it is obvious that an isthmian republic, whether it be Nicaragua, Colombia or Panama, cannot bargain for the lease, sale, or other transfer of territory for the benefit of a foreign power.

Yet under the Clayton-Bulwer treaty of 1850, the United States practically departs from this inhibition and proceeds to bargain with England on a "joint" project of building the canal.

The Clayton-Bulwer treaty not only was a bald attempt to ignore the Monroe Doctrine, but it has led to a continuation of this false assumption of rights on the part of the United States as to lead to the continual international and national difficulties besetting this country since the Panama Canal became a reality.

In other words, the Clayton-Bulwer treaty, as well as its successor, the Hay-Pauncefote treaty of 1901, are jointly inconsistent with the Monroe Doctrine, and being so have no place in American international law except as an anomaly.

The Hay-Pauncefote treaty, which has been held up as an example of advanced American diplomacy, unfortunately stands as a monument to the indifference, if not ineptitude, of American diplomacy. Far from being a conspicuous feat of the late Secretary Hay it remains, as it has always been (and it happens to be the standing joke in European chancelleries), an incomprehensible action. England had begun to take the Monroe Doctrine more seriously than it was thought, and expected any time a request by the United States to denounce the treaty of 1850. The American proposal of a substitute treaty, with real teeth in it, which was entirely in favor of England, was a surprise.

The United States did not have the right in 1850 to enter into an agreement with Great Britain or any other foreign power, for the construction of a canal and this right did not exist in 1900. To this extent the rights of Great Britain do not exist now, and did not exist then. The right of the United States to invite England in a joint undertaking on territory which the Monroe Doctrine has outlawed from Great Britain and other foreign nations cannot exist.

Tied Hands of United States

AT MOST it may be held that inasmuch as at that time the canal was planned in conjunction with a foreign power, or by a foreign power in conjunction with the United States, the Clayton-Bulwer treaty was ratified to fix the respective rights of the owners, but the instrument as it stands, or as it stood during its force, is anything but a working agreement of two partners about to venture in a mastodonic undertaking.

As a matter of fact, it has never been believed in Europe that England ever seriously entertained the idea of building an isthmian canal, and the curious thing is that the Clayton-Bulwer treaty, which practically tied the hands of the United States, was signed four years before the Suez Canal was begun. It is difficult to conceive England, after 1854, and certainly after 1869, when it was opened, as embarking in the distant enterprise of a canal in America whose effect would be to weaken England's hold on foreign shipping to the Orient.

As a restrictive and self-protecting measure, England's attitude is one of foresight. That England should in 1912 rely on the gratuitous rights granted by the United States under the Hay-Pauncefote treaty was to be expected, and the same protest against granting the free tolls privilege under the new law will follow again as a matter of diplomatic routine.

There is unmistakable propaganda in Washington against the restoration of the free tolls privilege, first granted under President Taft in 1912. Most of it, however, is of strictly American color and origin. It is quite local. It involves the so-called Middle West. It is supposed to have the sympathy of the railroads. But on the other hand, inter-American interests, clash as they may, will never be so serious as the foreign.

A few weeks ago, shortly before the Congressional recess, many newspapers were publishing dispatches from Washington to the effect that the President did not want the proposed exemption law discussed until after the limitation of armament conference, or that he preferred not to have it discussed in Congress, or that he wished to settle it by amicable "diplomatic exchange," that friction with England was inevitable, and that in any event reversing the Wilson legislation meant a dishonorable national act.

These dispatches skirted the simple truth; that the Harding Administration finds it difficult to extricate the country from formal commitments. And how extrication may follow unless the untenability of the American position is acknowledged, and frank admission is made that the Hay-Pauncefote treaty is an agreement in violation of the Monroe Doctrine, cannot be imagined.

In fact, a mere legislative provision exempting American coastwise vessels from the payment of tolls—in other words, the restoration of a former law—will not suffice for a permanent solution of the problem. It will tend, instead, to restrict the question to one of party politics, with the Republicans favoring exemption and the Democrats favoring tolls, both basing their opinions on interpretations of international law and existing treaties—and it has been shown that the treaties are unsound and un-American.

That fact is enough to warrant the administration in denouncing the Hay-Pauncefote treaty, but as it would be too much to expect the Republican party to acknowledge that a previous administration—and a highly praised one—made such an absurd mistake, politics may be served if need be by falling back upon proper diplomatic procedure.

It is very true, to forestall objectors, that records never fail to include such phrases as these: ". . . . benefits of it (the canal) ought not to be exclusively appropriated to any one nation," or ". . . . of securing forever, by such (treaty) stipulations, the free and equal right of navigating such canal to all such nations," or ". . . . such an enterprise should be for the benefit of the world's commerce, and in no proposition that it has ever made has it sought for its citizens or its commerce special advantages," or ". . . .It would be our earnest desire and expectation to see the world's peaceful commerce enjoy the same just, liberal, and rational treatment." These declarations are conditional and non-inclusive; the owner remains the owner with all rights.

The Hay-Pauncefote Agreement

THE "free and equal" canal policy of the United States, as set forth in the Hay-Pauncefote treaty, is based on this agreement: "The canal shall be free and open to these vessels of commerce and of war of all nations observing these rules, on terms of entire equality, so that there shall be no discrimination against any such nation, or its citizens or subjects, in respect of the conditions or charges of traffic, or otherwise. Such conditions and charges of traffic shall be just and equitable."

It is indeed difficult to see, in all these declarations, which are from official American records, where the United States is bound to deny itself certain privileges for the benefit of the world. As it has been pointed out, the Hay-Pauncefote treaty is made from a rib of the Clayton-Bulwer treaty, yet the second treaty entirely ignores the fact that the 1850 treaty was drafted when it was considered that England would assume one-half the responsibility, expenses, and fixed charges, for the construction and operation of the canal as then projected.

But most indicative of any, and at the same time rarely referred to, is President Grant's consistently American, pro-Monroe Doctrine, George Washingtonian policy, as made known by Hamilton Fish, his Secretary of State.

"The President," Secretary Fish wrote to Minister Hurlbut at Bogota, "is disinclined to enter into any entanglement in participation of control over the work with other powers. He regards it as an American enterprise, which he desires to be undertaken under American auspices, to the benefit of which the whole commercial world should be fully admitted."

Forty years or so afterward the Panama Canal was under construction, by American engineers, at American expense, as an American enterprise, for the benefit of the commercial world, but somewhere, somehow, President Grant's disinclination to enter into any entanglement in participation or control with other powers was forgotten. England, at no expense except that of diplomatic routine, was given the lion's share (as a European ambassador described it to the writer). Taking things away from a lion is always delicate work—and this occasion will prove no exception. But little will be gained by the United States by beating about the bush; by trying to conceal causes. A courageous handling of the entire difficulty will not diminish England's rights to equal participation, but it will give the United States certain rights which no treaty could ever take away from American citizens.

Rights of American Shipping

IT HAS been alleged that coastwise shipping, American-owned, has no rights in the canal. The allegation has been advanced frequently, backed by the treaty stipulations, but a very practical situation in its favor has been wholly ignored. There is no more reason why American shipping shall not enjoy the Panama Canal as an all-American enterprise than there would be in prohibiting free access to continental canals.

When the Panama Canal project was the cynosure of politics, under Roosevelt, the popular slogan was that American coastwise ships could make ports from one coast to the other, carrying freight much cheaper than railroads. But somehow the Panama Canal has never become even an active competitor of the railroads, and at the present pace will never do so.

This is due to the fog of hostile thought of politicians, who have reduced the waterway to a party plank, so to speak, as well as a mistaken idea on the part of unyielding, single-track minded men who fail to acknowledge that nothing is owed to Great Britain.

Recapitulating, England never intended building a canal; not intending to do so she decided to share authority with the United States, which "might build it"; England favored and built the Suez Canal, an actual competitor of the Panama waterway, though under a different foreign trade program Suez's value would be secondary; and that the United States, having assumed the entire burden of Panama waterway building and operating, England will depend on the word of the treaties to hamstring it as much as possible, by a strict interpretation of the treaties.

Denounce the treaties and there will be no more Panama Canal tolls problem.

The Porto Ricans and Self-Determination

By CHARLES E. GRADWELL

CHICKENS, political and feathered, come home to roost. Any farmer will prove to you the veracity of the adage, as applied to the egg-laying species, and if you are interested in the figurative chick, as applied to politics, consider Porto Rico.

In pre-Gamaliel times the doctrine of self-determination occupied the front page for quite a time. It was hailed as the cure-all for European ills. Self-determination—the weak sisters in the family of nations to determine for themselves the why, whom, what and when; the solution of the Balkan broil and the Silesian sizzle—all in six syllables and a hyphen!

The academic brain that gave birth to this utopian theory was concentrated on the trials and tribulations of territories and peoples in Europe, with no thought for those nearer home. However, the politicians of Porto Rico seized on the pronunciamiento of the then President of the United States, and assuming he would practice what he preached, managed to get their fellow countrymen all worked up at the prospect of independence.

Last year the Unionist party in Porto Rico rode into office on the platform of independence. The fact that the leaders know they have no more chance of independence than the proverbial snowball matters not. They got themselves elected and are now engaged in distributing the spoils after many lean years.

Porto Rico became the property of the United States in 1898, after the Spanish-American War, being part of the penalty paid by Spain for ruffling the eagle's feathers. The island is approximately 3,435 square miles in area. It is bounded on the north by the Atlantic and on the south by the Caribbean. The climate is an ideal one and the principal product is sugar. About five-eighths of the island is given over to sugar production. Tobacco and fruit raising are the next industries in order of importance. The natives speak Spanish and with them Americans are about as popular as an Englishman at a Sinn Fein meeting. If the people were given the choice tomorrow of remaining under the American flag or becoming one of King Alfonso's dominions, the United States would very quickly be minus one island possession. The reason for this is hard to find, for during the American Administration the living conditions of the natives have been improved beyond comparison. They have been taught something about hygiene, splendid roads have been built, and an intelligent school system installed. American teachers are employed and the rising generation is being taught the English language, which may help to dissipate the prejudices and superstitions of their parents.

Porto Rico has no stabilizing middle class; that is, none strong enough to exercise any influence on the political life of the island. But for the veto power invested in the American governor, the politicians would soon bankrupt the island with their prodigality. In fact, given independence it would not be long before the political and commercial life of the island would be completely in the hands of a half dozen men.

In common with the rest of the world, Porto Rico is suffering from the reaction of war-time prosperity. Gone are the days of 23-cent sugar, and the majority of planters will be fortunate this year if they get back their cost of production. Signs of restiveness are to be found in industrial strikes that have occurred intermittently this year—first the cigarmakers, and incidentally, the tobacco business is controlled by the American Tobacco Company; then the motormen and conductors on the San Juan trolley system, and also the employes of the American railroad company.

In each case the victory has been with the employers. The only apparent result obtained by the strikers was the slaying of the island's leading strike breaker.

The railroad was built with American capital, but was not found to be a profitable investment and the road was unloaded on local capital, which in turn, discovering that it had been stung, is now trying to unload the railroad on the government.

Scenes in Porto Rico, the inhabitants of which want to be free from the United States Government and govern themselves.

The primitive condition of the rolling stock is not conducive to making travel a pleasure, and any one acquainted with conditions prefers to travel from place to place by automobile.

The island has splendid roads and passenger and freight traffic is being successfully handled by auto lines to the detriment of the railroad.

Automobiles also are competing with the street cars to the detriment of the latter. Jitney service from San Juan to all parts can be obtained and workers find that they can reach their homes on the outskirts of the city by jitney in about one-half the time it takes by trolley.

The amusements are limited—motion picture theaters being about the only diversion. Although making large profits, the theaters of San Juan show their patrons American pictures of very ancient vintage.

A striking feature of all Porto Rican towns is the plaza—a large public square in the heart of the town or city. Plenty of shade trees and seats are provided, and here the natives can be found at all hours of the day settling the affairs of nations.

In most towns one also finds two clubs—Casino Espanol (Spanish club) and Casino Porto Rico (Porto Rico club), the local explanation being that Porto Ricans and Spaniards do not get along well together, although an examination of the membership rosters of both clubs reveals the astounding information that practically the same men make up the membership of both clubs.

Porto Ricans have a favorite word which might well be adopted as the island's slogan. It is *manana*, (tomorrow). They hate to be hustled and anything that can possibly be put off until *manana* is so relegated. If a Porto Rican makes an appointment with you for noon and shows up any time before 4 p. m. he is pretty much on time from his point of view.

The Porto Rican closes up his bank or store from noon until 1 p. m. each day while he takes lunch.

Another surprise the visitor gets in Porto Rico is the number of automobiles he sees. Every known make is represented and everyone seems to own one.

The Vanderbilt Habel Company, of New York, has built in San Juan a magnificent hotel known as the Condado Vanderbilt. It is easily the most beautiful and pretentious hotel in South America and would even meet with approval on esthetic Fifth Avenue. The hotel made a little money in its first season, but during the last season, November, 1920 to April, 1921, lost heavily.

An attempt was made to keep the hotel open all summer, the management consenting to this plan, provided 50 persons could be found in Porto Rico who would maintain one room throughout the summer. The rates asked were absurdly low, but the desired quota could not be raised and the hotel was closed. It will be opened again in November, but it is generally understood that if another season is experienced like the last one, the place will be closed for good and sold.

An effort was made to make Porto Rico a rival of Los Angeles as a place to produce motion pictures.

More than $250,000 was invested by local capital, but efforts to date do not seem to indicate that California is in any danger of losing its laurels.

Dr. Albert Shaw, editor of *The Review of Reviews*, visited Porto Rico in March as the guest of Governor Yager. On his return to this country, it is reported, he saw President Harding and told him what a good governor his friend Yager is. Dr. Shaw's interference brought forth a torrent of criticism and abuse from San Juan newspapers, but just how much influence Dr. Shaw's reported interview with the President had can be judged from the fact that the President has appointed E. Mont Reily, of Kansas, to succeed Yager.

Governor Reily has a big task. He will make himself unpopular if he vetoes some of the bills passed by the last legislature calling for extravagant expenditures, but his hardest task will be explaining that self-determination does not apply to Porto Rico.

The First Woman M. D.

TODAY every city has one or more women doctors; yet only a century ago there were none anywhere, none who had received a diploma and duly graduated from a medical college. Why, a century ago the child destined to become the first of her kind was born: date, February 3, 1821; place, Bristol, England; name, Elizabeth Blackwell.

The whole family transplanted itself to America when Elizabeth was 11 years old. She went to school, became a teacher in Kentucky, and spent many moments wondering what her life work should be. She was getting nowhere until an invalid friend in Cincinnati supplied the cue.

"Oh," the friend sighed, "if I could only have been treated by a woman doctor, I think much humiliation and suffering would have been spared me."

The conversation continued. They chatted merrily for a time on other subjects. Suddenly the woman's countenance displayed seriousness, and she turned and resumed the subject that had been dropped.

"You are fond of study, have health and leisure," she said. "Why not study medicine?"

For weeks and weeks she tried to banish the idea the friend had suggested, but it constantly recurred. She dreaded the life that is a vacuum. Finally out of the welter of her desires and aversions she chose the course which contained the most of the former with the least of the latter.

Elizabeth's family did not object; so she wrote to a number of physicians regarding the feasibility of her plan maturing. They agreed thoroughly that the idea was good but impossible, that women were barred from medical colleges, the obstacles numerous, and the education expensive. These replies, however, only whetted still further her appetite for conquest over a silly convention that should have been long obsolete.

A force stronger than herself seemed to lead her on. Certainly the shift was fortuitous. The principal of the school at Asheville, North Carolina, where the ambitious girl obtained a position as music instructor, had been a physician. Elizabeth borrowed his medical books, and applied her spare time to perusing them; thus she edged nearer her great goal.

By the summer of 1847 Elizabeth was ready to enter a medical college if she could find one that would admit her.

After being rejected by several medical schools, she was finally accepted as a student in a New York medical college, and she was graduated in 1849.

Two more years of study followed, one in London and one in Paris. In 1851 she returned to New York. With the help of philanthropic Quakers she established on the East Side a dispensary for women and children.

Two years later the charter for the New York Infirmary was obtained. At once Dr. Blackwell established a hospital where maternity cases could be handled with sympathy and understanding. It was a woman's hospital for women.

When the Civil War came, a meeting of interested women was held at the infirmary. Many offered themselves as nurses; but the significant feature is that in that crowded infirmary parlor the National Sanitary Aid Association was organized. What a great work it did in the war!

In 1864 Elizabeth and her sister, Emily, who had also obtained a medical education after many trying experiences, founded the Women's Medical College in New York. The failure of all efforts to gain admission for women in the large men's colleges had caused the women to have one of their very own. It was closed a few years later when the recognized institutions relented and threw their doors open to the other sex.

The infirmary grew and grew. In the dispensary connected with it 11,000 patients were treated in one year and 6,000 visits were made to patients in their own homes.

Elizabeth Blackwell wrote numerous books, "The Laws of Life," "The Human Element in Sex," "The Purchase of Women," "The Religion of Health," and probably a dozen more.

In 1869 she returned to the land of her nativity, England. She felt more at home there. Her sister, Emily, remained in New York guiding the destinies of the hospital and the infirmary.

Elizabeth died at the ripe old age of 89. At the hamlet of Kilmun Argyllshire, Scotland, a handsome Celtic cross marks the grave.

BRIEFLY TOLD

A mountain disintegrating so fast that the action is discernible day by day is a remarkable phenomenon of the Aussee region of Austria. Great cones and pinnacles of rock crash and tumble and forests lie flat or move slowly and steadily downward, piling into the valleys. It is believed that water in the chalky limestone core of the mountain causes the collapse of caverns and the slipping of strata.

"All the beans you can eat for 15 cents. All the spaghetti you want for 15 cents. All the coffee you can drink for a nickel. It's hell to be broke; if you're hungry, come on in anyway." So reads a sign of a West Thirty-fourth street restaurant man in New York City—and he says the restaurant is a great success.

Pulling teeth with only the fingers is the method used by Chinese dentists of the older class. From youth to manhood the dentist is trained to pull wooden pegs from a board and the training changes the aspect of the hand, giving him a finger grip equivalent to a lifting power of three or four hundred pounds.

Land birds far from land is a strange sight on Lake Michigan steamers. At sundown the rigging and spars of vessels at the docks form good roosting places for the land birds. When the boats move out under cover of darkness the birds are not aware of it. Upon waking up the birds circle around the vessel and finally rest on the rigging until they come to the boat's destination when they fly to shore to establish new homes.

Waterholes shaped like a carafe, with a narrow neck and wide cavity below, are found in the deserts of Western Australia, holding water only at night and drying up in the day. Near the bottom of these wells are found horizontal pits separating thin layers of gneiss from the main mass. The high temperature during the day expands the plate of gneiss, causing the water to retreat into the cavity thus formed, only to be expelled at night when the gneiss contracts.

A journal printed in shorthand by a tribe of Indians living in the interior of British Columbia is one of the queerest newspapers in the world. A French missionary learned the Indian vocabulary and taught them to write by means of shorthand signs, which represented all the sounds the Indians use in pronouncing the words. The paper has 16 pages and contains all the news of the tribe. More than 3,000 Indians have learned to read it.

Gold dust in such quantity as to make the eyes of old miners bulge with wonder was taken out of the earth by well diggers working on a farm near Portland, Oregon, recently.

Charged with making false returns, a woman election official has been indicted in West Virginia. This is the first instance since woman suffrage was granted that a woman has been indicted on this charge.

Sound-proof rooms for nervous artists are a part of a New York hotel service. They are installed on the top floor of the hotel. There are no windows in the rooms and the doors are of the ice box type, the room being ventilated by means of a special device. Each room is furnished with luxurious upholstered furniture, and the walls and ceilings are done in a flat dove-gray.

The American soldier will appear on a monument of thanksgiving in memory of sailors and soldiers who fell in the Great War, which will be erected at Lourdes, France.

Eels of certain kinds migrate as do birds. They are now leaving the British Isles for their journey across the Atlantic to their breeding waters, south of Bermuda, 3,000 miles distant. The eel progeny drift with the current of the Gulf Stream from the Bahamas to Europe, undergoing their metamorphosis enroute and taking between one and two years for the journey one way. The eel never returns to Europe after leaving for the Bermudas.

Coats for coatless men are furnished by the railroad dining room service in a station in Kansas City. Heretofore patrons were denied entrance to the dining room if they were coatless. Now the management has in readiness several nice coats which it permits the patrons to wear while eating.

An electrically operated typewriter is being manufactured by a German company. It is claimed to be a labor-saving device with an easy touch and considerably greater speed, and with virtually no wear nor tear on the nerves of the operator.

Paper barrels are being manufactured in Canada. Preparations are under way to make them suitable for the shipment of flour, dyes, lime, sugar, lard, butter and other goods.

Harnessing a volcano to provide power for manufacturing is the plan of a committee of manufacturers in Hawaii. Kilauea volcano is giving off vast quantities of heat, ranging as high as 2,000 degrees Fahrenheit. It is believed this heat can be developed into steam pressure from which electricity will be derived.

Recovering petroleum that has become mixed with water in the wells by means of a device similar to a cream separator will save millions of dollars annually, according to an American scientist. The machine is being used with success in oil fields of the Middle West. Its speed is 17,000 revolutions a minute, breaking up the emulsions into clear oil and salt water, which are then drained off through spouts.

The Hudson Bay Company, a powerful factor in the fur trade for three centuries, is turning its attention to the development of the oil resources which the company's holdings of more than 4,000,000 acres in Canada are believed to contain.

Buried treasure, believed to be a part of the loot of Jean Lafitte, the pirate, has been found in the vicinity of Jefferson Island, the home of the late Joseph Jefferson. According to legend, large sums of money were buried in that neighborhood by Lafitte, who operated in the eighteenth century.

Indians in Northern Canada face extinction unless measures are taken to safeguard them against contagious disease, according to an inspecting physician.

Ending a two-year vacation, Valentine Geyser in Yellowstone National Park now spouts twice weekly in the Norris Geyser basin.

The City Corporation of London has named one of its streets for Samuel Pepys, the quaint diarist.

Inoculating dogs instead of persons to prevent rabies is a custom among the Japanese. Instead of the usual methods of killing mad dogs, Japanese medical experts advocate inoculation of all dogs.

Rare marble is used to build roads in Kentucky, according to reports of experts. Twenty different kinds of marble, many varieties of commercial importance, have been crushed for road use.

Chinese are the most satisfactory bank depositors, according to a Chicago banker. They have the largest average accounts, and the bank never has any trouble or controversy with any of them. They ask no favors that cannot be granted to the bank's advantage and work hard and save their money.

Paris' "Hundred Kilo Club," a club composed of men tipping the scales at 220 pounds, is coming to life again. During the war many members lost out when the food restrictions and hard work of military service lowered their weight. Since the armistice many have gone into "training" at the little café where the club convenes, eating fattening foods.

Stone crabs of Florida have dug into the concrete piling of a bridge across Boce Ceiga Bay, near St. Petersburg, tearing holes in the stone to make homes for themselves. Heretofore concrete has been regarded as a match for everything but steel tools and high explosives. The piling is to be sheathed with sheet iron to prevent further damage from this source.

Contents of waste baskets at the Allied Supreme Council's last meeting at Paris reveal the secret thoughts of the League leaders. A journalist rescued the following scraps which the prime ministers scribbled and drew while the interpreters were translating various speeches: Lloyd George drew perfect oak leaves; Lord Curzon, a geographical map of mystery; Briand drew a picture of a wedding couple just emerging from a Parisian church. Briand is a bachelor.

Putting the Pianist on the Pay Roll

By HARRY H. DUNN

EUGENE BLANCHARD,

Of Oakland, California, who directed the mixed chorus of more than 300 voices on the first evening of the music festival.

TO GIVE genius a free hand, and to allow the artist to meet Inspiration at least half way, with a mind unwearied by financial cares, the people of a state are planning to provide a source of funds whereby composers, musicians, sculptors, painters and other creative artists may be paid for their work to such an extent, at least, that they may devote their best energies to productive work, rather than to teaching or to other laborious pursuits. Strangely enough, the men and women who are promoting this project, and who, in September, took the first big step toward its realization, are what are commonly known as "hard-headed business people," though, as a matter of fact, the idea of this altruistic revival of the Golden Age in art originated with a poet, a very capable poet, withal, who poetizes as a side issue, but who is a pretty hard-fisted battler in the world of dollars most of the time.

The state is California, and, on the fifteenth, sixteenth and seventeenth of September, this year, the composers, musicians and singers of that state were brought together, from Siskiyou to San Diego and from the Sierras to the sea, in a three-day music festival, in the Greek Theater at the University of California in Berkeley. Not only is this the first time a state has done this thing, but it marks the laying of the foundation of a center of art in California, in which producing artists will be regarded at least as worthy of their hire as the plumber or the carpenter or the bricklayer.

In another feature this music festival, which is to be an annual event, in one form or another, was unique —every instrumental or vocal composition produced was the work of a California composer, with the single exception of some of the kindergarten music introduced in the program presented by the young musicians of the public schools. Further than this, every musician and singer who appeared was and is a bona fide resident of California. Never in the history of music in the New World has a state attempted to prove itself so completely self-sufficient musically as this—and succeeded.

Attendance at the festival was recorded from every state of the Pacific slope. Washington, Oregon, Nevada, Arizona, New Mexico, all contributed their quota of men and women who came to hear the collected works of the California composers, the majority of them played or sung by the composers themselves, and many interpreted by musicians and singers of international reputation, but all residents of the westernmost state. Within this unusual production was another, even more unusual, for one of the programs, that which occupied the second of the three nights of music, was composed entirely of the work of composers resident in the city of Berkeley, as were also the instrumentalists and vocalists who interpreted the numbers.

Though Berkeley has only 60,000 inhabitants, there were more recognized composers and artists than could be accommodated on the program.

Charles Keeler, the leading poet of the Pacific Coast, conceived the idea of the establishment of the art and music center in Northern California, and, as the first step to that end, the three-day, all-California music festival was held. Now, though Mr. Keeler is a poet, he is also manager of the Berkeley Chamber of Commerce and one of the moving figures in the business life of the San Francisco Bay region. Instead, therefore, of endeavoring to lay the foundations of the state's art center among artists, he went to the business and professional men and women of the community, and obtained first, the support of the Berkeley Chamber of Commerce, then of the Berkeley city government, and, with this as a start, of the business, civic and municipal organizations of Oakland, San Francisco and other California cities. The Berkeley Chamber of Commerce named a permanent art committee, of which Mr. Keeler is a member, to take up the project of the art and music center for California, and carry it through, by every means possible, to a successful culmination. This committee is to be permanent, though its personnel may be changed from time to time, as necessity for such changes arise. One of the first things this committee did was to inform all the composers, instrumentalists and vocalists that they would be paid for their services to the musical festival. In all previous musical history, whenever so-called "local talent" has been drafted to give of its productions or its ability to a home exhibition, all the artists have been expected to donate their services free of charge, receiving their remuneration, if any, in the plaudits of their friends and the publicity given to the exhibition. In this instance the composers and artists were more than mildly surprised when they were offered contracts, at quite good figures, for the use of their compositions and their own appearances on the programs. This method of paying for services rendered is to be maintained at all these annual musical festivals at Berkeley hereafter. This year, the net proceeds, after all expenses were paid, went to the War Memorial for the city of Berkeley, the implanting of the idea of the art and music center in the public mind being considered sufficient result for this year's festival.

Above—TSIANINA, the Indian girl from Southern California, who sang a number of Indian songs, compositions of Charles Wakefield Cadman, leading composer of the Pacific Coast.

Left—FRED'K. MAURER, JR., of Berkeley, who furnished a number of his own songs, played and sung by himself, on the second night of the music festival.

The proceeds of next year's festival, and of similar events each year thereafter, will go to the establishment of a foundation for the art and music center, from which funds recognized composers, and other producing artists in sculpture, painting and literature, will be put on such a financial basis that they may devote the best of their time and talents to their chosen work. Incidentally, this is the first time the people of a state have shown such wide and practical appreciation of the position of the artist in the life of the community

Four programs were presented during the three-day music festival in the Greek Theater, three in the evening and one in an afternoon. In the majority of cases, the composers selected their own programs, as well as the artists who were to assist them in the presentation of their compositions. This rather novel method of arranging the programs proved highly pleasing in its results, since it enabled the composer to select what he himself knew to be the best of his work, and to have it presented by men and women whom he knew to be most familiar with it and most capable of presenting it in the spirit in which it was intended to be presented when written. As no syncopation, ragtime, nor so-called "jazz" was permitted in any part of any program, the Jewish composers were entirely absent, yet the thousands who attended all the presentations manifested their approval and enjoyment of the classical and popular selections of the best grade offered by the long list of American, Italian and French composers, instrumentalists and singers.

WILLIAM J. McCOY,

Composer and master of orchestration of the celebrated Bohemian Club of San Francisco, under whose direction that club presented a number of its famous musical offerings on the closing night of the 3-day music festival, Berkeley, Calif.

THOMAS F. FREEMAN,

Of Berkeley, composer and pianist, who contributed largely to the success of the evening in the music festival in which the city of Berkeley furnished all the composers, compositions and artists who interpreted them.

The first night of the music festival, September 15, was devoted to the works of Charles Wakefield Cadman, of Los Angeles, considered one of the leading composers of the Pacific Coast, and internationally known as an interpreter of the Indian dance music and folk songs of the American Indian. An Indian girl, Tsianina, of the Cherokee tribe, possessed of a pleasing mezzo-soprano voice, sang two groups of the composer's Indian songs, including the weirdly thrilling Zuni "Invocation to the Sun God," the lilting Ojibway Canoe Song, and the popular "From the Land of the Sky Blue Water." Mr. Cadman's Trio in D Major was played by Mr. Cadman at the piano, with Antonio de Grassi at the violin and Arthur Weiss at the cello. A chorus of more than 300 voices, under direction of Eugene Blanchard and Lowell Redfield, sang three selections, the entire evening being devoted to the compositions of the Southern California composer of music and songs.

The second evening was given over completely to the works of residents of Berkeley, including, among the musical numbers, a dramatic reading from the play "Sempervirens" by Mrs. Ralph Waldo Trine, with incidental music by a sextet of stringed instruments, which, by the way, furnished one of the most interesting parts of the program. Seven Berkeley composers were represented, including Frederick Maurer, Jr., E. G. Stricklen, Henry B. Pasmore, Thomas Frederick Freeman, Catherine Urner, Antonio de Grassi and Wallace A. Sabin.

The Saturday matinee saw more than 1,500 public school children of Berkeley, presenting individually and collectively the musical work of these schools as one program in the music festival. The combined bands of all the high and grammar schools furnished one organization of more than 1,000 instruments, and a chorus of nearly as many voices sang to the accompaniment of this band, believed to be the largest amateur musical organization ever assembled. The school children's matinee was the best attended of all four presentations of the music festival, and the great Greek Theater was crowded to the exits. The music given led through the kindergarten work, to choral and orchestral performance in the schools to the playing of the Berkeley High School Orchestra, which has taken prizes all over the state. Keen rivalry was aroused among the schools for this music festival before the spring term ended in June, and the result was that many of the children had worked on their individual numbers during the summer, making the entire presentation probably as nearly perfect as it could have been with so many participants. The schools have been assured that one program of each annual festival will be given over to them, and work has been started on next year's program.

On Saturday night, the closing night of the music festival, the celebrated Bohemian Club of San Francisco, which each year presents an original play in Bohemian Grove, and gives a number of musical events, took charge of the program. More than 2,500 members of the club and their friends went from San Francisco to the Greek Theater, where the following five numbers were staged by the club:

1. Excerpts from "Ilya of Muron" *U. Marcelli*

   Grove Play of 1920, Book by Charles Caldwell Dobie.
   Chorus and Orchestras, conducted by the composer.

2. "Hunting Song" *Eugene Blanchard*

   Sunday Morning Concert, 1916.
   Orchestra conducted by the composer

3. "Man of the Forest" (Fantasia) *J. D. Redding*

   Grove Play 1902, Book by Charles K. Field, conducted by the composer.

4. "St. Patrick of Tara" *W. Sabin*

   Grove Play 1908, Book by Henry Morse Stephens
   Prelude, Chorus and Orchestra, conducted by the composer.

5. "Egypt" Opera in Four Acts. *W. J. McCoy.*

   Book by Charles K. Field
   (a) Farewell Duet Act 1
   Cleopatra, Mrs. R. G. Retallick; Anthony, sung by Charles Bulotti *W. J. McCoy*

   (b) Prelude—Prayer and Storm Scene Act III
   Cleopatra Chorus of Priests and Priestesses
   Conducted by the composer.

The Champion of All Destructive Insects

By C. E. COLLINS

THE most destructive insect in America, who would have eaten the dry goods you buy, the clothes you wear, the very shirt from your back if he had got around to it, is now busily engaged in consuming another $500,000,000 worth of farm crops in the southern states. The house fly, the mosquito, the fruit tree borer, the wheat field chinch bug—all of them must take a back seat when this persistent pest of Dixie steps forward. He is the champion of 'em all. For dollar-and-cents destruction it is doubtful if the records he is making can be duplicated in the whole history of agricultural pests. He out-armies the army worm, and the Kansas grasshopper is a mere flash in the pan compared with him.

A mature cotton boll that has been attacked by the weevil.

He is the cotton boll weevil.

Since that day back in the early 90's—there is some doubt as to just the exact year—when he winged his flight through America's back door from across the Rio Grande somewhere near Brownsville, Texas, he has swept Dixie until today there is not a section that has not felt nor feared him.

Poisons of all kinds and descriptions; traps, nets, fire—even the gas clouds that were used in sweeping the battlefields of France—have failed to hold him in check.

On the most conservative estimates he has already eaten, since visiting the United States, something more than 10,000,000 bales of cotton. A bale of cotton weighs 500 pounds. Ten cents a pound is a moderate valuation. And the $500,000,000 appetite is merely whetted. This half-billion dollar loss to southern agriculture does not take into consideration the hundreds of acres of lands that were deserted nor the loss incident to reduced acreage or altered farming systems.

In the last six years, with cotton prices higher than since the Civil War, and with the Allies urging the growing of greater and greater cotton crops—with every inducement for the greatest production of cotton humanly possible—the growers in the southern states were unable to exceed a 12,000,000-bale a year average. The boll weevil damage nullified their efforts.

What is the boll weevil? Where did he come from and when and how? What does he do to cotton? Why hasn't he been stopped?

These are familiar questions from the northern man when he first visits the cotton states, especially if his visit is in the growing season, when weather and weevil share equally in the anxiety of the farmer.

Grub, or weevil worm, which does the damage to cotton.

Entomologists have been studying the boll weevil for years and have experimented constantly with means of eradicating him; the United States Department of Agriculture, state governments and private interests have spent thousands upon thousands of dollars in carrying on the investigations and experiments, and some of the most brilliant entomologists have been enlisted in the work, but the doom of the weevil is not yet sealed. He is scattered over a wider area and his clan numbers more by billions today than ever before, and the weapon to stop him is yet to be devised.

Progress, however, in holding him in check a few weeks during the most active part of his career, has been made, but since the new method is scarcely more than two years old it is yet far from the perfection that undoubtedly is to be expected. At present it is a system of poisoning which aims only to interrupt the weevil long enough for the cotton to mature to a point where but little damage can be done to it.

The cotton boll weevil belongs to the beetle family. An adult is less than a quarter of an inch long, including his remarkable snout, and about a third as wide as it is long. It has a grayish-green color which grows darker as the adult ages. Some authorities say there are more than 25,000 species, with as many characteristics and habits which closely resemble it, causing belief in many cotton sections in the early days of infestation that the boll weevil had come, when it really was a related specie that had been found. The cotton weevil is distinguished from its relations by the tibiae of the first pair of legs, which have two small spines.

The attack on cotton is made by the female weevil, which punctures the buds of the plant with her long, strong snout. An egg is deposited in the bud and from it a worm hatches, and it is this infant that does the damage. It feeds on the tender interior of the bud, or "square," as it is known, and instead of blooming, the bud falls to the ground. Late in the season the female attacks the boll, which forms after the blooms and from which the fleecy cotton comes. The boll seldom drops but withers away, sometimes maturing and bursting, but instead of the handful of snowy-white cotton fiber, there is but a pinch of ragged, curled, worthless cotton unfit for any use

It has been estimated that one pair of weevils will produce 12,000,000 offspring in a single season. The period of life seldom is more than six months and, ordinarily, is much less if the weather is hot and dry. Late generations hibernate during the winter, emerging in the spring to start hordes of new generations. Severe frosts and cold weather do more to kill the weevil than perhaps any other natural or artificial agency, although severe heat also is a dire enemy.

Under normal conditions the worm or grub will hatch from the egg in three days. The grub immediately begins feeding. In a week it passes into the pupa stage similar to the cocoon of butterflies. In three to five days the adult weevil, or beetle, issues. Thus in two or three weeks there is a new generation.

The hibernating adults begin to appear with the first warm days of spring, some as early as February. By the last of June they are all out. First feeding is on the tender foliage of the young cotton plants. In badly infested fields it often appears that the plants are alive with weevil by the time the first flowers appear. The period of hibernation is an excellent time to exert control work. Winter quarters may be leaves, grass, the old cotton stalks, nearby woods, litter, and so on. Destruction of these and late autumn and early spring plowing are methods now urged on farmers by the investigators. Rotation of crops, selection of fields offering fewest hiding places and other such precautions are essential, they say.

A mature cotton boll weevil, (considerably enlarged).

Implements for shaking the cotton stalks have been tried, both to dislodge the weevil and to loosen the infested buds, but unless the sun's rays reach the ground and the weather is dry and hot, the death rate is so low as to be negligible.

The use of strong lights at night has been tried, but Mr. Weevil, unlike many of his kith and kin, has no time for the Great White Way. In one government experiment more than 24,900 specimens of insects were captured in a weevil-infested field—but there was not one weevil in the number.

While dozens upon dozens of "cures" have been submitted to the field men in charge of the investigations in the southern states, and practically all have been pronounced of no value, the Bureau of Entomology takes an interest in each new proposal. A special laboratory is maintained at Tallulah, Louisiana, and no weevil question, problem, device or cure, however far-fetched and absurd, is permitted to slip past without some sort of a practical test or experiment.

Nature herself thus far has done more than man, for all his shrewdness, in holding the weevil in check. Severely hot and severely cold weather are merciless enemies. Were it not for these and other natural enemies, cotton production in the United States would be an absolute impossibility by this time.

No less than 45 insect enemies of the weevil, nearly half of them parasites, are helping hold the pest in check. Birds, too, are allies. Chief of the insect enemies is a small reddish-brown ant, of which 12 species have been identified. They prey on the immature stages of the weevil in the cotton buds or bolls and some investigations have disclosed that from 25 to 50 per cent of these immature stages have been found destroyed through the agency of the ants alone.

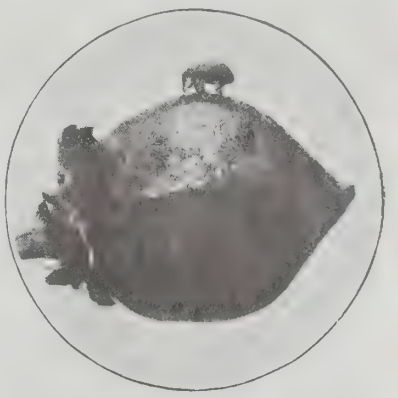
Horse-drawn poison dusting machine in cotton field infected with weevil.

The truly great accomplishment in heading off weevil losses has come since 1919. It is the use of calcium arsenate poison. It is the one outstanding and really the only method of fighting the weevil that the government's experts will say is bringing actual and paying results.

Calcium arsenate dust is sprayed in clouds on infected cotton fields at certain periods and certain intervals, not to eradicate the weevil but to hold him in check until the cotton can mature its fruit.

This system has been developed very largely through the efforts of B. R. Coad and T. P. Cassidy, experts in the southern field crop insect investigations of the Bureau of Entomology. They say frankly:

"It should be understood at the outset that the present system of boll weevil poisoning is not intended to eradicate the weevil. It is purely a percentage proposition, and the best that can be hoped under the present methods of operation is to reduce the weevils sufficiently to permit the maturing of a full crop of cotton."



The poisoning is done by spraying clouds of the dust over and through the plants by both hand "guns" and machine or power dusters. At present most of the dusting is done at night, when the plants are moist and when the air is calm, so that full benefit is obtained of all the poison.

Specifications of the preparation as now developed provide for not less than 40 per cent arsenic pentoxide; not less than 0.75 per cent water soluble arsenic pentoxide, with a density of not less than 80 nor more than 100 cubic inches a pound.

Quite a number of manufacturers now are turning out the poison and the dusting machines, but owing to the many uncertainties because of the newness of the system, farmers are being urged to avail themselves of the free analysis offered at the government laboratory at Tallulah, before they start poisoning work.

Properly made, the preparation does not injure the plants, nor is it injurious to man or animal, although excessive contact with the dust should be avoided, the experts say.

Five to seven pounds of the poison to each acre of ground at each application is advised. The work should start, it is suggested, when fields are 15 to 20 per cent infected, or when the first squares begin falling. Application should be made at four-day intervals until three or four have been completed, or until the bolls are well enough developed to escape injury, else kept up to prevent more than 30 per cent infestation. The cost of poisoning this year is estimated at from $6 to $10 an acre, but more efficient methods of manufacture of both poison and implements is expected to reduce these figures materially.

Boll Weevil attacking a cotton boll just before the boll matures.

For all his destructiveness and in spite of his enormous appetite, the cotton boll weevil is not without his good points. In some portions of the cotton belt he has forced the farmers to pay less attention to cotton and more to the growing of general farm crops, a thing for which the South's leading minds have been working for years. The one-crop system, they have said time after time, is ruinous. "Safe Farming" has been a battle cry in Dixie for fully 15 years, but it remained for the boll weevil to force the issue in many sections. Farms that had grown nothing but cotton were forced to grow corn, hay, live stock and other feeds and foods.

In one Alabama cotton city a monument was erected to the boll weevil recently. The farmers of that community abandoned an all-cotton farming system because of weevil damage and they were so elated with the safe farming system that a fund was raised, a monument executed, and it was erected in a conspicuous place in the town.

What the future will bring and what the developments will mean to the cotton producing states in the way of changed methods of growing cotton and in the agriculture of the region is a matter of speculation. Breeding and cross breeding to develop early maturing varieties of cotton that will get ahead of the weevil already is well advanced under the leadership of the Bureau of Plant Industry. Old methods are giving away in favor of methods that will aid in stemming the weevil tide.

3. Write clearly.

Arbuckle and the Newspapers

HOLLYWOOD always was a horror to those who really knew it. Long before the recent troubles of the fat so-called comedian, whose "party" is now the sensation of newspaper readers, there was always an accompaniment of horror in the whole commercialized motion picture business. It has always been tainted and now it is ruined, for reasons which are well known to readers of THE DEARBORN INDEPENDENT'S recent exposé of the control of motion pictures.

The attempt to centralize attention on Fatty Arbuckle and make him the sacrificial offering may succeed. But the Arbuckle party was not the first, nor the hundred and first; nor is it the first with tragic accompaniments. It is not the first evidence the authorities had of what was going on. It is not the first information the newspapers have had of what the life of the motion picture colony really was. What has happened out of the ordinary is that the victim this time was a rather well-known picture star. The case of Fatty Arbuckle and Virginia Rappe is only one of many eruptions upon a body wholly rotten.

It was rather amusing to observe how well-informed the newspapers proved themselves to be immediately following the Arbuckle-Rappe sensation. They knew the very same day, that life at Hollywood was rotten; they knew that Arbuckle was anything but what the deceived motion picture public thought him to be; they knew that decent entertainment could not come out of such an atmosphere as Hollywood fostered. But they had never before told their readers!

Only a few weeks ago, when earnest men and women were sounding a warning against conditions in the motion picture industry, these newspapers which became suddenly so wise, were printing the most scathing editorials against the "reformers" and were carrying on a cartoon propaganda against those whom they portrayed as propagating blue laws. If what they say now is true, what they said then was false; it was in direct obedience to the advertising influence exercised by the motion picture industry, and was not the expression of editorial conviction.

No one cares how much prestige the motion pictures lose, but the loss of confidence in the newspapers is a public calamity. Cannot the newspapers see how regularly they have been let in for just such reversals as the present one? No one believed that the defense of the motion picture industry previous to the Arbuckle trouble, represented the true feeling of the staffs of our newspapers, just as no one believes today that the propaganda patter in favor of liquor is the expression of honest editorial conviction. Both are "by order" and are considered as an unwritten but clearly understood part of advertising contracts. The newspapers who can afford to divulge their knowledge when bestiality and violence have torn the lid off, can more profitably afford to divulge their knowledge before the lid is torn off. Prevention is more useful than post-mortem denunciation.

The regrettable thing is not the San Francisco hotel tragedy. In the very nature of the case, these things must come, and have come, and will come again as long as present conditions last. The regrettable thing is that American newspapers permitted themselves to be apologists for the makers of the conditions, to the extent of palliating them right up to the eve of the Arbuckle case.

An Honorable Compromise

IT IS already apparent that if the Washington Conference for the Limitation of Armaments is to bring about the result for which the world hopes, the negotiators must have that flexibility of mind which makes agreement through compromise possible. For many Americans, the word "compromise" in itself has unfortunate and distasteful associations. We are a positive people. "Compromise" often suggests lack of moral fiber and some weakening of will in holding out for a principle. We think of William Lloyd Garrison's heroic declaration in his fight against chattel slavery: "To die prepared, but not an inch to yield."

There are, of course, occasions when compromise may imply surrender, and even betrayal, of principle. But oftener an attitude of extreme rigidity in the name of principle is simply a blind stubbornness that in reality imperils the triumph of the vaunted principle and sacrifices substantial gain. So entirely honest and high-minded a statesman as Gladstone once declared that all political progress came through wise and timely compromise.

Of this sort, possibly, is the compromise Lloyd George now suggests in regard to such a modification of the Anglo-Japanese Alliance as would make it a tripartite affair to include the United States. He finds himself in a difficult position as between the Conservatives in his coalition insisting on a renewal of the old dual alliance as of paramount importance to British interests, especially in India, and the more liberal opinion of leaders, like Viscount Grey and Lord Bryce, who sincerely regard a friendly, even if indefinite, understanding and co-operation with the United States as the more important desideratum.

The first view is supported not only by foreign office traditions, but also by British naval opinion, as represented by Winston Churchill and Lord Lee of Fareham. These leaders are much more impressed with the power of the Japanese Navy than with that of our own navy in Far Eastern waters. The second view, besides commanding Liberal and Labor support in Britain, is strongly urged by the spokesmen of the great self-governing Overseas Dominions.

An Anglo-American-Japanese understanding, such as the British premier now suggests, may make possible the successful steering of a middle course which will prove satisfactory all round. So with Japan's feeling that if she is to accept as a permanency the present inferiority of her naval strength to that of either America or Britain, then we should be willing to cease the virtual increase of armament involved in our program for the further establishment and strengthening of naval bases and fortifications in our Pacific insular possessions.

An hospitable attitude toward any proposition that will make distinctly for the prime object of the conference: the lessening of possibilities of future wars and of consequent need of armaments is the one essential in considering such compromises.

Government by Gunmen

EVIDENCE multiplies day by day that the anarchy in West Virginia is traceable directly to the displacing of government of, by and for the people by government of, by and for the coal and railroad corporations.

For all the orderly processes of law in a modern democratic community these corporations seem to have succeeded (in the regions that were in insurrection and controlled by the mine-owners) in substituting the rule of gunmen, of hired thugs and mercenaries, assassins and plug-uglies furnished by a private detective agency and imported from outside the state. In the districts in which the mine-owners play the part of dictators, the local governments are on record as pliant tools of their will and mere auxiliaries of the gunmen.

This on one side of the question. On the other it is charged that similarly anarchistic combinations of working miners inaugurated a reign of lawlessness in the regions that were actually in their hands. Any attempt to apportion blame between the warring interests of mine-owners and mine-workers is entirely beside the great main issue. This is nothing less than the imperative necessity of restoring an American form of government in the state of West Virginia. Now that the legally constituted state authorities have abdicated in favor of the Federal Government, opportunity and duty synchronize. It is high time, indeed, for a decisive cleaning up of the state.

We are asking the nations to disarm in the name of humanity and civilization. Let us be consistent enough to ban the irresponsible desperadoes to whom the disputants of West Virginia have delegated the task of settling with revolver and shotgun their differences. Let it be understood that the substitution of privately controlled armed forces for the law of the land, constitutes high treason.

Not until anarchy is ended and its chief cause and incitement abolished by the will of the people, backed and aided with all the resources of the Federal Government, will West Virginia once more vindicate its right to the proud motto of the state: *"Montani Semper Liberi"*—Mountaineers Are Ever Freemen.

Capitalism and Communism

THERE is much significance in the rapid abandonment of communism and the return to a régime of individual enterprise in Soviet Russia. Largely in consequence of the contracts made with the outside world for the facilitating of famine relief, even the Moscow theaters and picture shows are being turned over to private enterprise. Factories are being leased to individuals and groups. Just as soon as the bars began to be let down, applications for such leases poured into Petrograd by the score and they now number more than 100. Five per cent of the product is offered to the government by 35 former owners who want to re-establish stocking and glove factories. Agricultural machinery works have been leased in Odessa and sawmills in Gomel. Twenty-four small samovar makers have started up operations in Tula.

Parenthetically, American and English manufacturers would certainly consider a five per cent tax as light indeed. Our congressional committees, which are now wrestling with the taxation problem, may well wonder if they have not something to learn from Russia: The possibility, for instance, that it may not be an unalloyed blessing to rely wholly on taxes in providing government revenue.

As to the changed trend in the direction of "capitalism," observers long ago became convinced by the logic of events that those responsible for the Bolshevist bouleversement do not object so much to the capitalistic system as to Gentile control of capital. In fact, the very eleventh-hour change of front heralded in the opening up of Russia to trade with the world, and the concessions being granted by Lenin for the "capitalistic" exploitation of Russia's rich natural resources (always for a consideration), lend color to the suspicion that, with a certain racial subtlety, "communism" has been simply a tool for the transfer of the capital of that unhappy country from Russian to un-Russian control. Czarist absolutism was doomed to assassination not by reason of any Bolshevist hatred of absolutism, but because it blocked that transfer.

Man's True Inheritance

THE supposition that tuberculosis is an hereditary disease was long ago exploded by the medical science of our day. Some lingering vestiges of its long sway over the public mind appears in the current discussion in the European press anent the recent celebration of his eighty-sixth birthday by M. Camille Saint-Saëns, the French composer. It is recalled that his father died of consumption several months before the birth of the future celebrity on October 9, 1835. "What have the old-fashioned eugenists to say to this fact?" it is asked.

Undoubtedly, Francis Galton, the "father of eugenics," has much to answer for. Soon after the appearance of his book on "Heredity" English and American novelists were prone to utilize his theme for the construction of plots in which noble and self-sacrificing heroes or heroines refuse to marry because of a presumed taint in the blood derived from an ancestor who had died of consumption. The prevalence of this belief indeed caused many a youth and many a maiden to regard themselves as doomed because of such a "family history," and so mentally to magnify the symptoms of a cough or cold and to induce the very negative conditions of depression and despair in which a slight cough may be developed into a serious pulmonary degeneration.

The present concensus of medical opinion, based on extended study and research in actual cases, is to the effect that the direct "inheritance" of consumption is extremely rare; the existence of families especially liable to develop tuberculosis and to die from it is doubtful. At most, one may inherit general conditions of health or lack of health that indicate a "tendency" to tuberculous disease. Such a tendency means simply that special care in the matter of sanitation and diet is called for to overcome the tendency. Instances are numerous in which weaklings, facing and fighting the evil tendency, have developed into unusually strong, vital and long-lived men and women.

And a big help in the fight is remembrance that our greater inheritance in the matter of health conditions is derived from our earlier ancestors who roamed the hills and the plains and sailed the seas, living sane, normal lives, one with nature. Health is a more invincible fact than is disease.

Mr. Ford's Page

THERE never was a time when propaganda against the truth was so brilliant and efficient, and by that token there never was a time when the truth had a better opportunity. The evil that is about to disappear flares up in a burst of glory just before its collapse. The worst delusion of all is its delusion of success. Between ripeness and decay the line is too fine to be seen. Look at the glory of German imperialism in years preceding 1914!—it was but the early brilliance of a conflagration that reduced it to ashes. Look at the all-powerfulness of the liquor barons during the 10 years previous to the people's revolt; our governments were made at the bars of saloons and our national policies dictated by a whisky ring; no political party ever achieved such power as did the liquor barons. But that very power was already the beginning of the end. Baseball itself was a summer fever; in pennant time it became a sort of madness; it ruled the leisure of the country. But that flare of popularity was but the signal of a change.

Success is dangerous, because it is only on short-time plans that you can see success; and when you see it, you may know that the end has come. If it come in a good cause, you may know that the cause is about to be swallowed up in another or greater. But if success come in a bad cause—that is, a cause that trivializes, misleads, corrupts or exploits the people—then you may accept the success as a harbinger of collapse.

This is a principle to be firmly grasped by those who are amazed at the bold course which the propaganda of untruth takes in the world today. It is really a cause for rejoicing and not despair. The higher their balloon goes, the sooner will it burst. If you are to fear any propaganda, fear that which has existed for years and decades and centuries without success; fear that which has never won the brilliant and mighty to its cause; fear that which exists in the humility and tenacity of truth; fear that which is cursed with unpopularity, so that modern butterfly men and women avoid it—for that is the propaganda that is linked with truth, and it never succeeds, because its end is too great to be fulfilled in that trifling temporary thing which men call "success." The thing that is always living without succeeding, is the thing to fear. That which can live without success has its rootage in eternity; only that which is soon to disappear must have immediate success.

This is not a matter of faith, but of knowledge. All knowledge begins in faith, but faith, that does not settle down into sure knowledge to make room for deeper-digging and higher-soaring faith, is not performing the function of faith. Faith is first an inner sense of the way the world works, just as the inventor is led by an inner sense to do things that were never done before. But his inner sense does not lead him the second time; his faith has crystallized into knowledge, and his action the second time is dictated by knowledge.

Faith begins in hope; and hope when it is true ripens into belief; and belief when it matures is knowledge, and knowledge is power. They are all developments along the one line, and they never develop to their highest except in a spiritual atmosphere, that is, the atmosphere of ideas from the Good, and ideals toward the Good—name it how you will.

This old world, if we could see it essentially, is a field of contending forces—the forces of Light and the forces of Darkness. Incarnate in the bodies of men or in institutions, they are sometimes mixed in great confusion and are hard to identify; but the insight which comes by faith gives us ever a surer touch in these matters. Men whose intentions are founded in simplicity and good will have an inner sense by which they know the quality of a man or a movement, whether it be good or evil. The hardest man to deceive in all the world is a good man, not because he is smarter and shrewder than the other, but because faith is antiseptic and protective. He *knows* in a different way than the "wise" man of the world knows.

You see the world then, for what it is, a battlefield between contending forces, and if you pay attention to the appearances of things you begin to think that the evil forces have it all their own way and are bound to win. Have they not wealth on their side? Have they not wisdom, polish, shrewdness? Have they not the suave, refined, comfortable people? Have they not convention and respectability? Yes, and so has every cause that fell. Such things are the twilights of the dying.

What you see *with* the eye is not the truth; it is what you see *through* the eye, using the faculty of faith within. And you see then that brilliant as the autumn is, it is the time of stripping bare.

The propagandists of false things have their day. Their work is skillfully done. All mechanical, financial and political forces are at their service. With their work they seem to cover the earth and men take note of the flood of matter which they pour upon a patient humanity.

Yet with every planting a worm is planted. And when the plant grows and is about to fulfill the highest hopes, lo, it withers and decays. At the heart of every propaganda of falsehood there are fatal worms—insincerity, untruth, supreme selfishness; these kill whatever harbors them, kills outright after bringing a simulated fever of success. It is the law of the world.

In the hopeful archives of the truth there is a saying that it is always darkest just before dawn; in the experience of organized, aggressive and self-confident evil the saying is reversed—it is always brightest just before nightfall.

That is not hope, but knowledge. It *is* so; not it *may be* so. The last thing we have to fear is successful evil. The louder its songs of triumph roar, the oftener its glass of celebration is quaffed, the more swiftly is it fulfilling its doom. The Feast of Belshazzar is always being repeated. Success is death, when it comes in a wrong cause. Brilliancy of propaganda is the hectic flush of a fatal fever, when exercised in a wrong cause. Even that so-called popularity, the temporary tickling of the people's ear, is merely the preparation of the people for a terrific rebound in furious indignation against imposture.

We are now in a time when the inconvenience of previous impostures is being severely left by the rulers of the old scheme of things. There was a time when words did duty for things—words, words, words. How sick the people became of words during the period when we won the war and lost the peace. Words, words, words!—high cathedral-like words, soft promissory words, words of wide visionary range. They soothed the people because they were at least a recognition in vocal sound of what was silent in the people's hearts. But these words were excuses, not seeds. They were meant to satisfy the people with less than they asked. Thence has arisen a great distrust of words.

At a time when it would be most convenient for the rulers of the old order of things to pass words at their old-time value, they find a distrust of words everywhere. The exchange value is very low. The people prefer deeds. Words had great success several years ago. But it was another case where success was death—because the words were employed to deceive. A brilliant game, a successful game, but it is dead. When you push your evil game to the very apex of achievement, be sure of this—the game is over.

SUCCESS in an evil program is the harbinger of collapse. The bold course of evil propaganda, with its brilliant achievements, is a cause for rejoicing, not for despair; because the more hectic the popularity the more sure and swift the fall. Never fear the rise of insincerity, selfishness or deception to what seems to be success. Never grow sour because the false and unjust rise to power. It is the only way in which they can be destroyed. Success is death in a wrong cause. Even in a good cause, success may indicate a short-time program. Success is always the epitaph of something. But nowhere is the meaning of it more hopeful than when the wrong succeeds. That is sign of the end.

Making Weather Forecasts for the Nation

By C. F. MARVIN

Chief of the United States Weather Bureau.

TO THE general public the Weather Bureau probably is best known through the medium of its daily forecasts and weather maps. These forecasts are based on simultaneous observations of local weather conditions taken daily at 8 o'clock in the morning and 8 o'clock in the evening, 75th meridan time, at about 200 regular observing stations scattered throughout the United States and the West Indies, and on similar reports received daily from various points in other parts of the Northern Hemisphere.

The results of these observations are immediately telegraphed to the central office at Washington, D. C., and other forecast centers, where they are charted for study and interpretation by experts trained to forecast the weather conditions that may be expected to prevail during the following 36 or 48 hours.

A complete report includes such data as temperature, pressure (reduced to sea level), precipitation, direction of the wind, state of weather, current wind velocity, clouds, and maximum or minimum temperature since last observation. From this information the forecaster, by comparison with preceding reports, is able to trace the paths of storm areas from the time of their appearance to the moment of observation, and approximately determine and forecast their subsequent courses and the attendant weather conditions. A careful comparison of the forecasts with the weather for the periods covered show an approximate verification of 90 per cent.

Distributing the Forecasts

WITHIN two hours after the morning observations have been taken the forecasts are telegraphed from the forecast centers to about 1,600 principal distributing points, whence they are further disseminated by telegraph, telephone, wireless telegraphy and mail. The forecasts reach nearly 90,000 addresses daily by mail and are available to more than 5,000,000 telephone subscribers within an hour of the time of issue. This system is in addition to and distinct from the distribution effected through the press associations and the daily newspapers. The rural free mail delivery system and rural telephone lines also are being utilized to bring within the benefits of this system a large number of farming communities.

Today there is scarcely any important industry or activity of the nation which is not to a greater or less extent influenced by weather conditions, and therefore needs the advices, information and economic benefits which flow from the full and efficient administration of the Weather Bureau's duties.

These benefits are of great variety and the information, advices and warnings of the Weather Bureau serve the immediate needs of practically every interest in the nation. Great atmospheric disturbances visit with relative frequency one section of the country or another. Violent storms, cold waves, frosts, freezes, hurricanes, floods, heavy snows, and the like, repeatedly cause destruction of property, such as shipping on the Great Lakes and coastal waters of the nation, and, in recent times, the lives and property engaged in aerial navigation.

Crops and farms in flooded districts are laid waste. Lambs, live stock and meat animals in the stock ranges of the West are killed by blizzards and cold waves. Orchard crops, truck gardens, and vineyards everywhere are damaged by frosts and freezes. By forecasts and warnings, issued and disseminated well in advance, great economic benefits and saving accrue to the nation through the precautionary measures which can be taken on timely advices to minimize or ward off injuries which otherwise inevitably attend the great atmospheric phenomena mentioned.

All Depend on the Weather

THE benefits of the weather service have been readily appreciated by nearly every industry and every department of our complex civilization. Reports on climatic conditions have been demanded for farmers, and observations and warnings for the public and for railroad and water carriers. Hence the sphere of the meteorologist has been extended to cover the study not only of the dynamics and motions of the atmosphere, but of climatology—the prevailing temperature and rainfall—together with their effects on human life.

The importance of a foreknowledge of weather changes in the conduct of the daily affairs of life was early recognized. The invention of the telegraph made the dissemination of this information possible, and practical meteorologists soon began to formulate plans for the preparation and effective distribution of weather forecasts and warnings. These efforts led to the organization of weather bureaus, some of them antedating our own, in nearly every civilized country. The cordial co-operation of these national bureaus in the general interchange of data and knowledge has tended to marked increase in the value of the respective services to the community at large.

Obviously meteorology cannot be limited by either national or even continental boundaries. Its logical field must embrace the entire globe. Every success attained in great storm warnings and forecasts simply increases the confidence of those served and benefited, awakens great expectations, and imposes added obligations on the forecasters.

The greatest hope in meeting this situation comes through the collection of numerous reports from the vast ocean expanses and international exchange of observations. A circumpolar service of this character, but of small extent, which existed before the war, has not yet been restored, but happily agencies are at work which give promise that the future will ultimately bring about the realization of a daily weather map, first of the Northern Hemisphere and, possibly, later of the world.

While the mass of data available for land and continental areas is very great, the details of information available from the larger expanses of ocean areas are correspondingly meager and inadequate. Owing to the uniformity of conditions over ocean areas, as well as their tremendous extent, we should expect the sequence of atmospheric phenomena to be more simple and easy of investigation. The collection of more complete data from ocean areas and its intimate analysis and discussion are, therefore, most important.

The term "aerology" has come recently to be applied to the meteorology of the free atmosphere in contrast to observational data dealing specifically with surface conditions. The appliances and agencies for conducting observations in the free air have been improved, multiplied and made highly practical, and the attainment of practical navigation of the air has not only added to the observational possibilities but has imposed new and important obligations on the meteorologist to make applications of his science to the aid of aerial navigation.

Free air observations over the oceans especially are greatly desired, although very difficult to obtain. The whole field of investigations in the free air is relatively only recently occupied and appears to be fruitful of the most important developments. The organization of systematic studies of upper air observations to be carried on concurrently with the making of the observations is at once among the foremost problems awaiting consideration.

It is hoped that these and closely related investigations may lead to the further solution of problems in dynamic meteorology and give more detailed information than now available concerning the general circulation of free air. The value of this aerological work does not lie so much in the current use of the data, though many of the observations are individually useful, as in the light thrown on the whole subject of dynamic meteorology.

Forecasts for Airmen

CLOSELY related to this work is the new form of "flying weather" forecasts. The country has been divided into 13 zones, and a separate forecast made for each of them in the morning and certain of the eastern zones in the afternoon. A typical forecast, which explains their character, is as follows:

> Zones 1 and 2: poor flying weather today; local thunder showers probable; moderate to fresh south and southwest surface winds, becoming west and moderately strong above 3,000 feet.

The Weather Bureau is maintained and conducted in the interest of all the people, and officials of the bureau earnestly desire that the greatest possible use be made of the very large amount of meteorological data accumulated during 45 years. Information as to how data and publications of the bureau may be obtained and the steps necessary to procure the forecasts and warnings will be promptly furnished on request.

Certainly the activities of the Weather Bureau are comprehensive enough, as will be seen by the following summary:

Weather forecasts and warnings include daily forecasts and weather information, weekly forecasts, shippers' forecasts, storm and hurricane warnings, cold wave warnings; frost warnings for truckers, tobacco, cranberry and sugar growers; fire weather warnings, for the protection of forests; forecasts and warnings for stock growers; fruit frost warnings; forecasts for alfalfa growers, and fruit-spraying forecasts.

The highway weather service consists of the issue of bulletins giving the conditions of the main highways in the section in which the distribution center is located, and their passability as affected by rains, heavy snows and other conditions. Detours and other pertinent information are included. These bulletins are used by travelers in determining journeys and routes, in the dispatching of trucks, determining of loads, and so on.

Aerological investigations; forecasts and warnings in aid of aviation, involve the furnishing of reliable information as to free air conditions for the benefit of aviation in general. There is no authenticated instance in which an aviator has had an accident due to bad weather when favorable weather had been forecast.

Marine meteorology in aid of navigation and vessel reporting means much useful information and assistance to mariners. A full understanding of the meteorology of the ocean is of tremendous economic value in determining the safest and best voyage routes, the location of dangerous storm areas and other meteorological facts. Vessel reporting gives owners several hours' advance notice of the docking of ships and enables them to assemble stevedores and make other arrangements regarding loading and so on.

Evaporation and run-off investigations are conducted in certain arid and semi-arid regions of the far West to determine the loss of storage water by evaporation. These results are of value to engineers in planning city water supply systems and water and irrigation reservoirs. Another study is of the effect of forest covers on stream flow, erosion and run-off, which involves the making of continuous observations in two nearly similar watersheds in their natural forested condition for a term of years; then to denude one of the watersheds and continue the observations for a similar period of years for comparative purposes.

River and flood work is one of the most valuable and important activities of the Weather Bureau service. Gages are maintained at suitable intervals on all the navigable rivers of the United States, their tributaries and watersheds. When conditions warrant, warnings of floods are disseminated to all affected interests in the flood areas by the quickest means possible. The saving which results from this service consists in transferring goods, stores and other movable property to places of safety.

Mountain snowfall and water supply investigations are maintained in the western states to give dependable information relative to the seasonal snow cover, its depth and water content, by which may be determined the probable water supply that will be available both for irrigation and power purposes in those states having little or no rainfall in the summer months.

Advising the Producers

CLIMATOLOGICAL work consists of observations that are useful to commercial exchanges, farmers, engineers, home seekers and many other classes; and its value is incalculable. It affects and benefits the entire people; and is used even in the settling of damage claims, cases at law and for other purposes too numerous to mention.

Agricultural meteorology consists of a service of collection and dissemination of information relative to the effect of current weather conditions on farm activities, the growth of vegetation and the development of crops and their advancement as compared with an average season. Advice is given in the interest of various lines of agriculture and horticulture and stock-raising, and as to growing seasons and crop yields. It involves three classes of work; corn and wheat service, cotton region work and cattle region service.

Solar radiation, already alluded to, is to measure the intensity of the sun. Illuminating engineers have for a long time been asking for measurements of daylight or sunshine intensity expressed in light units. This information is of special value to them in connection with the designing of factories and other buildings to meet the requirements of state laws relative to natural light.

Seismological investigations are undertaken to determine how frequently on the average and how severely the various portions of the country are shaken by earthquakes. By this data it may be learned what sections of the country are seismic; just where the active cracks are, and their liability to further slips or movements. This information is of prime importance in enabling engineers to avoid the placing of aqueducts for city water supplies, dams and other structures on or across fault lines.

It can be easily understood, therefore, that the extent to which the work of the Weather Bureau affects the daily life of the people and becomes a factor in their various vocations and business enterprises, already very great, is increasing yearly.

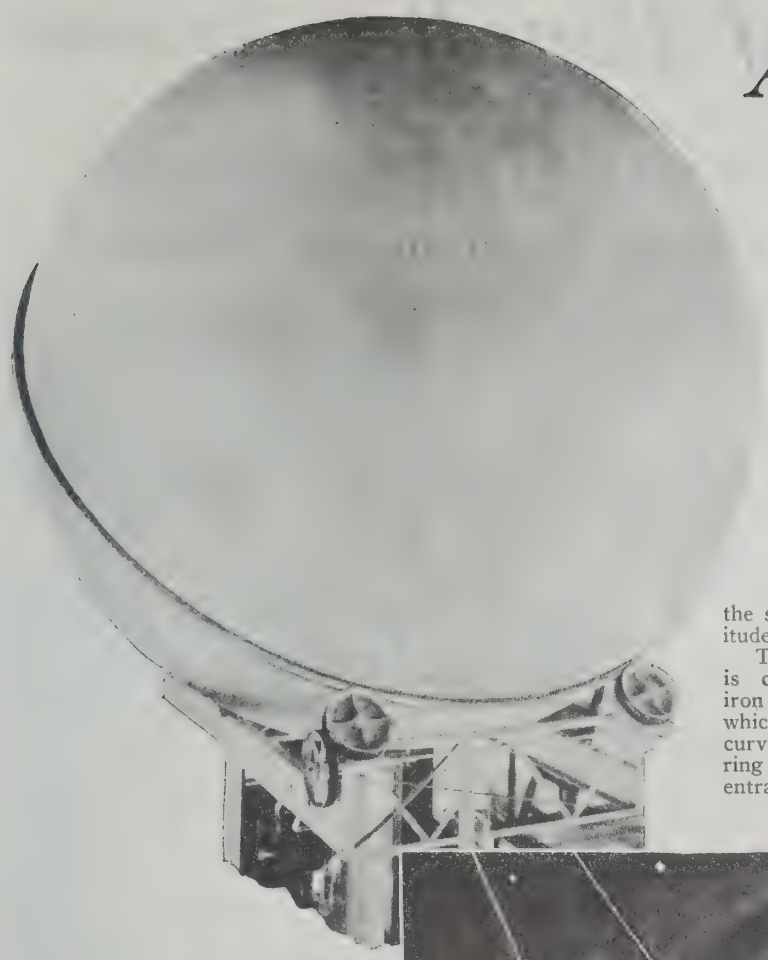
Storm Warnings Valuable

OF THE warnings, those of storms and hurricanes, issued for the benefit of marine interests, are the most important and pecuniarily valuable, and so nearly perfect has this service become that scarcely a storm of marked danger to maritime interests has occurred for years for which ample warnings have not been issued from 12 to 24 hours in advance. The warnings of those sudden and destructive temperature changes known as cold waves are probably next in importance. The warnings issued for a single cold wave of exceptional severity and extent resulted in the saving of more than $3,500,000 through the protection of property from injury or destruction. The warnings of frosts and freezing weather are also of immense value, particularly to the fruit, sugar, tobacco, and market gardening interests, as well as to the citrous fruit districts.

There are numerous special applications of the information to individual pursuits and industries that might not be suspected. An account of some of these may lead to an increased use of the data in quarters where the possibility of their application has not yet been recognized.

Transportation companies make continued use of the forecasts in all their shipments. Perishable goods are protected against temperature extremes by icing or heating, as conditions may require.

The uses made of temperature forecasts in the cities are more varied than is generally supposed. With notice of an approaching cold wave greenhouses are closed and boilers are fired; preparations are made by heating and lighting plants, whether gas, electric, steam, or hot water, to meet the increased demands that will follow. Fire plugs, exposed mains and general plumbing are protected. Gasoline engines are drained. Work in concrete is stopped. Merchants direct attention largely to cold weather articles and prepare their stocks accordingly.



In the agricultural districts these warnings are invaluable, especially in the spring, when the tender vegetables are protected by covering and fruit is safeguarded by smudging, irrigation, or other methods designed to maintain the temperatures above the danger point. Likewise these forecasts are utilized by farmers in the killing of hogs, by sheepmen at lambing and shearing time, and by stockmen in general.

Rain forecasts are of great value, too. They are especially utilized in the large fruit-growing districts to enable picking in advance of rains. Vegetables dug in dry weather are also shipped in better condition than those on which rain has fallen after they have been taken from the ground. Lime, cement, brick, drain tile and sewer pipe material all require protection from rain during the process of manufacture, and cement work must be protected from rain a day or two after it is laid.

A Miniature Firmament

Where All Can Study the Sky

By ROBERT H. MOULTON

TO GIVE Chicago people a simple and vivid instrument for studying the heavens, the Chicago Academy of Sciences has constructed a miniature universe on the inner walls of a 15-foot sheet iron sphere. This big, hollow globe, placed in the museum of the academy, can exactly and ingeniously depict all the celestial phenomena regularly visible to Chicago.

All the stars of the first, second, third and fourth magnitude, and a selected few of the fifth magnitude, are shown in the sphere. The full number of fixed stars thus shown is 692. Included in the exhibit are representations of the sun, moon, and four planets, Venus, Jupiter, Mars and Saturn, all of which are visible to the unaided eye. The celestial equator is also clearly marked in the interior of the sphere, and the ecliptic, or apparently yearly path of the sun among the stars is also shown.

The impression gained by looking out at night on a clear sky is that of a hemispherical dome of infinite size, studded with stars. The Celestial Sphere gives a miniature reproduction of this surface, which we call the sky and in which the stars are commonly supposed to be placed. Necessarily, the sphere is of almost microscopic size, as compared with the universe. If the earth were represented in proportion, it would be an infinitesimal ball located in the center of the sphere, while an observer standing on this ball would be correspondingly tiny.

The earth, as we all know, looks flat to any one standing on its surface, and we can see only one-half of the heavens at one time; the half which lies above the plane bounded by the horizon. The same effect is gained in the Celestial Sphere by providing it with a so-called horizon table, which extends out from the inner surface of the sphere almost to its center, surrounds the observer and lies in the same plane as the center. There is thus exposed to a person standing in the center of the sphere a complete hemisphere, corresponding to the one we see above the surface of the earth, the other hemisphere being hidden by the horizon table, just as the earth conceals the other celestial hemisphere.

Not only is the Celestial Sphere a perfect pattern of the firmament, but in every other respect, with the possible exception of shooting stars, the idea is carried out in detail. In it, the sun, moon and stars rise in the east and pass overhead, following certain definite paths, just as the real stars do in the real sky. Fortunately for the observer, however, the effect is produced in exactly the opposite way, since, if this were not so, he would at times be put to the inconvenience of standing on his head. We know it is the rotation of the earth on its axis that causes the stars to move across the heavens, and that the sky itself does not move. In the Celestial Sphere the sky actually does rotate, being so mounted as to turn about the miniature earth, which we have imagined as being placed at its center.

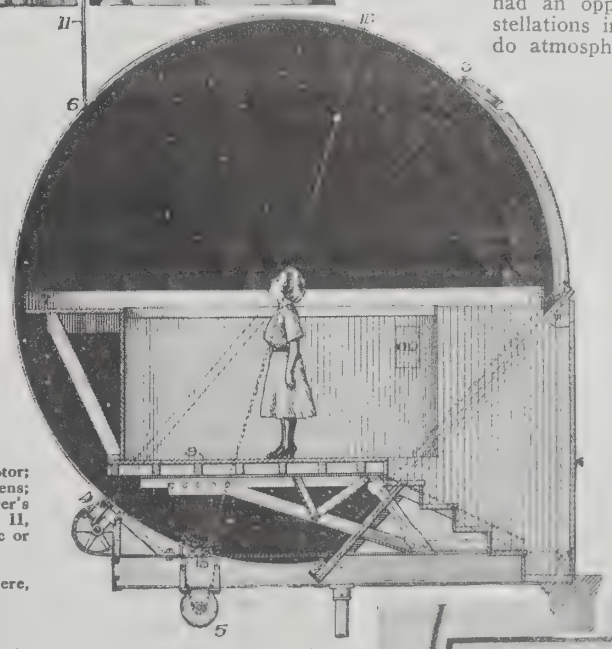
There are certain parts of the sky which are never visible to observers at any given point. At Chicago, for instance, because it is north of the equator, one can at no time see the stars in the South Polar region. If one were to stand in a level field near Chicago and look straight south just above the horizon, his line of vision would pass as close to the South Pole as is possible from this latitude. If he continued so to look for 24 hours, during which time the earth would make a complete revolution on its axis, his line of vision would describe a circle on the imaginary spherical surface called the sky. This circle would inclose that part of the sky which is never visible to an observer at Chicago. In the Celestial Sphere that part of the spherical shell coming within this circle was omitted, thus leaving an opening for the entrance of the observer, and for supporting trusses for the observer's platform. The omission of this part of the spherical shell in no way interferes with a correct representation of the sky for this latitude, since no part of the opening ever appears above the horizon. The diameter of this opening subtends an arc of 83° 40′ on the spherical shell, or twice 41° 50′, the latitude of Chicago.

The sphere is 15 feet in diameter and is constructed of very light galvanized iron one-sixty-fourth of an inch thick, which has been pressed to the proper curvature, and soldered to the equatorial ring and to a much smaller ring about the entrance to the sphere. Its total weight, exclusive of the wooden platform inside, is a little more than 500 pounds. This weight is carried by a two and one-half inch tube attached to the outside of the sphere along the line of the equator and resting on three wheels, two of which are under the lower side of the sphere, while the other is just above the entrance door. The greater portion of the weight is carried by the two lower wheels, the upper one being designed to resist a certain thrust due to the inclined position of the sphere.

As this sphere was constructed for observers at Chicago, who are located on the surface of the earth at North Latitude 41° 50′, it would not, of course, give an accurate representation of the firmament to observers in other latitudes. Similar spheres constructed for other latitudes north or south would be placed at other angles and would represent other constellations.

For example, a Celestial Sphere for Buenos Aires would be constructed to represent the southern heavens and would be so placed that an observer would enter from the North Polar region. He would see the southern constellations, which are not visible at Chicago, but, on the other hand, would fail to see any of the constellations about the North Pole which are visible from Chicago latitude.

The rotation of the two wheels on the under side of the sphere, which are propelled by an electric motor, attached to the steel structure supporting the sphere, causes the spherical shell in turn to rotate. This motor also supplies the light for illuminating the interior of the sphere, the power being controlled from within. The electric light necessary for representing the sun is received at the North Pole at a rotary contact, and carried by an insulated wire to the ecliptic, about which there is a wire on the side of the sphere. The fixed stars are shown by tiny perforations in the surface of the spherical shell, these perforations being of different sizes according to the magnitude of the stars which they represent. The size and location of each star was determined by an instrument especially constructed for this purpose. Even the shifting positions of the planets, Jupiter, Venus, Mars and Saturn, among the constellations have been provided for; a number of openings representing the different positions of each of these planets at different times of the year serve this purpose. When not in use these extra openings are very readily covered.



The sun is represented by a small electric light, to give it greater brilliancy than that possessed by the other heavenly bodies. The moon is represented by a similar light enclosed in a circular box, and by means of an ingenious device its different phases can be shown. The box inclosing the light is provided with a slot into which opaque discs may be inserted to cover portions of the moon's face, so that it can be exhibited at full, three-quarters, one-quarter, and so on, as desired. The lights representing the sun and moon are movable so that these bodies may always be kept in their appropriate places.

From an educational standpoint the Celestial Sphere undoubtedly will prove of the greatest value. For a long time the Chicago Academy of Sciences has appreciated the increasing interest in the stars, and the difficulty which every one meets in trying to become familiar with even the brighter stars and more commonly known constellations. The means heretofore provided for aiding students, such as flat star charts and globes on the outside of which stars are sometimes represented, are unsatisfactory and often confusing to the untrained observer.

Through the use of the Celestial Sphere it is possible to become familiar with all the constellations that are ever visible in the latitude, and, of course, the same thing applies to any other latitude for which a sphere may be specially constructed. Very few persons have had an opportunity of seeing all the constellations in any one latitude, for not only do atmospheric conditions serve to conceal many of them, but their apparent motion is so slow that it would require many hours of careful watching to see all those visible on a single perfectly clear night.

The use of the Celestial Sphere also makes simple many of the mathematical conceptions necessary for the study of descriptive astronomy, which so often discourage the beginner, as well as many of the fundamental ideas in mathematical geography necsesary in elementary education. There is now no reason why anyone, including school children, cannot become familiar with the chief constellations, their apparent movements, the brighter stars, and the real and apparent movements of the sun, moon and planets.

1—View of the Celestial Sphere, showing machinery for turning it.

2—Interior of the Celestial Sphere. Wallace Atwood, the inventor, is pointing out some of the constellations, his arm resting on the horizon table, which corresponds to the surface of the earth. The white spots represent certain stars.

3 Cross section of the Celestial Sphere. 1-2, South Polar ring at entrance to sphere; 3, Upper wheel supporting sphere; 4, One of the two lower wheels which support the sphere and are propelled by electric motor; 5, Electric motor; 6, North Pole of the heavens; 7-8, Horizon table; 9, Observer's platform; 10, Switchboard; 11, Electric wire; 12-13, Ecliptic or apparent path of the sun.

4—View of the Celestial Sphere, showing the entrance door.

The Jewish Associates of Benedict Arnold

Beginning the Story of the Part Played by Jews in the Treason of Benedict Arnold; the Principal Material Being Brought From Jewish Sources

AS THE Jewish propagandists in the United States cannot be trusted to give the people all the facts—even though these propagandists have the facts in their possession—it devolves upon some impartial agency to do so. The Jewish propagandists are accorded the utmost freedom of the newspapers of the United States—by reason of Jewish advertising being more than 75 per cent of all the advertising done in this country—and thus a wide web of false impressions is constantly being woven around the Jewish Question. The most recent is the widespread publication of a new "exposure" of the origin of the Protocols. This makes the sixth "final" and "complete" exposure that the Jews have put forth for public consumption. The Jews have still time to repent and tell the truth. Suppose they make the seventh the whole truth with a true repudiation of the Protocols.

It is THE DEARBORN INDEPENDENT'S purpose to open up from time to time new angles of the Jewish Question, so that the candid reader who would be informed of the extensive character of Jewish influence may obtain a general view of it.

Filling in Omitted Parts of History

THE part taken by Jews in the wars of the United States has been a subject of considerable boasting by Jewish publicists. It is a most interesting subject. It deserves the fullest possible treatment. It is not THE DEARBORN INDEPENDENT'S present purpose to challenge the Jewish boast; it is, however, our purpose to fill in the omitted parts of the story, and supply the missing links in several of the most interesting episodes in American history. This will be done on the basis of unquestioned historical authority, mostly of a Jewish character, and solely in the interests of a complete understanding of a matter which Jewish leaders have brought to the front.

The first subject which will be treated in this series is *the part of Jews in the treason of Benedict Arnold.*

Benedict Arnold, the most conspicuous traitor in American history, has been the subject of considerable comment of late. Among the commentators have been American Jews who have failed to make known to the American public the information which may be found in Jewish archives concerning Benedict Arnold and his associates.

To begin with, the propensity of the Jews to engage in the business of supplying the needs of armies and to avail themselves as far as possible of war contracts, is of long standing and notice.

An authority on this matter, Werner Sombart, says in his "Jews and Modern Capitalism" (pp. 50-53):

"The Jews throughout the sixteenth, seventeenth and eighteenth centuries were most influential as army-purveyors and as the moneyed men to whom the princes looked for financial backing . . . . we cannot attempt to mention every possible example. We can only point the way; it will be for subsequent research to follow.

"Although there are numerous cases on record of Jews acting in the capacity of army-contractors in Spain previous to 1492, I shall not refer to this period, because it lies outside the scope of our present considerations. We shall confine ourselves to the centuries that followed, and begin with England.

The Jews as Ancient Quartermasters

"IN THE seventeenth and eighteenth centuries the Jews had already achieved renown as army-purveyors. Under the Commonwealth the most famous army-contractor was Antonio Fernandez Carvajal, "the great Jew," who came to London some time between 1630 and 1635, and was very soon accounted among the most prominent traders in the land. In 1649 he was one of the five London merchants intrusted by the council of state with the army contract for corn. It is said that he annually imported into England silver to the value of £100,000. In the period that ensued, especially in the wars of William III, Sir Solomon Medina ('the Jew Medina') was 'the great contractor,' and for his services he was knighted, being the first professing Jew to receive that honor.

"It was the same in the wars of the Spanish Succession; here, too, Jews were the principal army-contractors. In 1716 the Jews of Strassburg recall the services they rendered the armies of Louis XIV by furnishing information and supplying provisions. Indeed, Louis XIV's army-contractor-in-chief was a Jew, Jacob Worms by name; and in the eighteenth century Jews gradually took a more and more prominent part in this work. In 1727 the Jews of Metz brought into the city in the space of six weeks, 2,000 horses for food and more than 5,000 for remounts. Field Marshal Maurice, of Saxony, the victor of Fontenoy, expressed the opinion that his armies were never better served with supplies than when the Jews were the contractors. One of the best-known of the army-contractors in the time of the last two Louises was Cerf Beer, in whose patent of naturalization it is recorded that '. . . . in the wars which raged in Alsace in 1770 and 1771 he found the opportunity of proving his zeal in our service and in that of the state.'

"Similarly the house of Gradis, of Bordeaux, was an establishment of international repute in the eighteenth century. Abraham Gradis set up large storehouses in Quebec to supply the needs of the French troops there. Under the Revolutionary Government, under the Directory, in the Napoleonic wars it was always the Jews who acted as purveyors. In this connection a public notice displayed in the streets of Paris is significant. There was a famine in the city and the Jews were called upon to show their gratitude for the rights bestowed upon them by the Revolution by bringing in corn. 'They alone,' says the author of the notice, 'can successfully accomplish this enterprise, thanks to their business relations, of which their fellow citizens ought to have full benefit. A parallel story comes from Dresden. In 1720 the Court Jew, Jonas Meyer, saved the town from starvation by supplying it with large quantities of corn. (The Chronicler mentions 40,000 bushels.)

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

From 1492 to 1776—the Same Business

"ALL over Germany, the Jews from an early date were found in the ranks of the army-contractors. Let us enumerate a few of them. There was Isaac Meyer in the sixteenth century, who, when admitted by Cardinal Albrecht as a resident of Halberstadt in 1537, was enjoined by him, in view of the dangerous times, 'to supply our monastery with good weapons and armour.' There was Joselman von Rosheim, who in 1548 received an imperial letter of protection because he had supplied both money and provisions for the army. In 1546 there is a record of Bohemian Jews who provided great-coats and blankets for the army. In the next century another Bohemian Jew, Lazarus by name, received an official declaration that he 'obtained either in person or at his own expense, valuable information for the imperial troops, and that he made it his business to see that the army had a good supply of ammunition and clothing.' The Great Elector also had recourse to Jews for his military needs. Leimann Gompertz and Solomon Elias were his contractors for cannon, powder and so forth. There were numerous others: Samuel Julius, remount contractor under the Elector Frederick Augustus of Saxony; the Model family, court-purveyors and army-contractors in the Duchy of Ansbach in the seventeenth and eighteenth centuries are well known in history. In short, as one writer of the time pithily expresses it, 'all the contractors are Jews and all the Jews are contractors.'

"Austria does not differ in this respect from Germany, France and England. The wealthy Jews, who in the reign of the Emperor Leopold received permission to resettle in Vienna (1670)—the Oppenheimers, Wertheimers, Mayer Herschel and the rest—were all army-contractors. And we find the same thing in all the countries under the Austrian Crown.

"Lastly, we must mention the Jewish army-contractors who provisioned the American troops in the Revolutionary and Civil wars."

Sombart's record ceases there. He does not go on to mention "the Jewish contractors who provisioned the American troops in the Revolutionary and Civil wars." That task shall be THE DEARBORN INDEPENDENT'S from time to time in the future.

It is in the study of Jewish money-making out of war that the clues are found to most of the great abuses of which Jews have been guilty. In the present instance, it was in the matter of profiteering in war goods, that the Jewish connections of Benedict Arnold were discovered.

"Wars are the Jews' harvests" is an ancient saying. Their predilection for the quartermaster's department has been observed anciently and modernly. Their interest being mostly in profits and not in national issues; their traditional loyalty being to the Jewish nation, rather than to any other nation; it is only natural that they should be found to be the merchants of goods and information in times of war—that is, the war profiteers and the spies. As the unbroken program is traced through the Revolutionary War, through the American Civil War, and through the Great War of recent occurrence, the only change observable is the increasing power and profit of the Jews.

Although the number of Jews resident in the American colonies was very small, there were enough to make a mark on the Revolutionary War; and while there was no wholesale legislation against Jews as there was in the Civil War, there were actions against individuals for the same causes which in 1861-5 obtained more extensively.

The Jews in the American Colonies

THE Journals of the Continental Congress contain numerous entries of payments made to Jews, as well as the records of various dealings with them on other scores. For drums, for blankets, for rifles, for provisions, for clothing—these are the usual entries. Most of the Jewish commissars were Indian traders (the extent to which the Jews dealt with the American Indians has not as yet been made a subject of research it deserves). The Gratz family of Pennsylvania carried on a very extensive Indian trade and amassed a vast fortune out of it. A most curious lot of information concerning the dealings of the Colonies with the Jews is obtainable by a search through the old records.

The Jews of Colonial New York were both loyalists and rebels, as the tide turned. They profited under loyalism by the contracts which they secured, and by buying in the confiscated property of those who were loyal to the American cause. It is interesting to note that some of the purchasers of the extensive Delancey properties were Jews. Delancey was a patriot whom New York City afterward honored by giving his name to an important thoroughfare. That same New York has recently by official action separated the name of Delancey from that thoroughfare, and substituted the name of Jacob H. Schiff, a Jew, native of Frankfort-on-the-Main.

We enter immediately into the limits of the Benedict Arnold narrative by making mention of the Franks family of Philadelphia, of which family several members will claim our attention.

The Franks were Jews from England who settled in America, retaining their English connections. They were in the business of public contracts, principally army contracts. They were holders of the British army contracts for the French and Indian wars, and for the succeeding Revolutionary War.

The Important Franks Family

TO GET the picture, conceive it thus, as it is taken from Jewish sources:

Moses Franks lived in England, doing business with the British Government direct. 'He had the contract for supplying all the British forces in America before military trouble between the Colonies and the Home Government was thought of. He was the principal purveyor of the British Army in Quebec, Montreal, Massachusetts, New York and in the country of the Illinois Indians. It was all British territory then.

Jacob Franks lived in New York. He was American representative of Moses Franks of England. He was the American agent of the Franks Army Purveyors Syndicate—for that is what it was.

In Philadelphia was *David Franks,* son of Jacob, of New York. David was the Franks' agent for the state or colony of Pennsylvania. He was at the seat of the colonial government, the center of American politics. He was hand in glove with many of the fathers of the American Government. He was an immensely rich

man (although but an agent) and carried a high hand at Philadelphia.

At Montreal was another Franks—*David Solesbury Franks*—also in the business of army contractor. He was a gay young man, described as "a blooded buck," who knew all the arts of turning an honest penny out of the needs of armies and the distress of nations. This young man was a grandson or grand nephew of the Moses Franks of England, as he was a nephew of the David Franks of Philadelphia.

Here and there were other Franks, all intent on business with the non-Jewish government, but the four here mentioned carry along the main parts of the tale.

A moment's digression will give us at once a view of the looseness of the liberalism of some of the Fathers of the Country, and a view of the equanimity with which David Franks, of Philadelphia, could pass from one rôle to another—a facility which cost him dearly when war came on.

A Side Light on the Early Times

JOHN TRUMBULL, an artist of considerable note at the time, whose paintings still adorn the National Capitol, was invited to dine at Thomas Jefferson's home, among the guests being Senator Giles, from Virginia. Trumbull tells the story:

"I was scarcely seated when Giles began to rally me on the Puritanical ancestry and character of New England. I saw there was no other person from New England present, and, therefore, although conscious that I was in no degree qualified to manage a religious discussion, I felt myself bound to defend my country on this delicate point as well as I could. Whether it had been prearranged that a debate on the Christian religion, in which it should be powerfully ridiculed on the one side and weakly defended on the other, was to be brought forward as promising amusement to a rather free-thinking dinner party, I will not presume to say, but it had that appearance, and Mr. Giles pushed his raillery, to my no small annoyance, if not to my discomfiture, until dinner was announced.

"That I hoped would relieve me by giving a new turn to the conversation, but the company was hardly seated at table when he renewed the assault with increased asperity, and proceeded so far at last as to ridicule the character, conduct and doctrines of the Divine Founder of our religion; Mr. Jefferson in the meantime smiling and nodding approval on Mr. Giles, while the rest of the company silently left me and my defense to our fate, until at length my friend David Franks took up the argument on my side. 'Thinking this a fair opportunity for avoiding further conversation on the subject, I turned to Mr. Jefferson and said, 'Sir, this is a strange situation in which I find myself; in a country professing Christianity and at a table with Christians, as I supposed, I find my religion and myself attacked with severe and almost irresistible wit and raillery, and not a person to aid in my defense but my friend Mr. Franks, who is himself a Jew.'"

This episode throws a curious light on the character of Thomas Jefferson's "philosophical unbelief," the unlovely fashion of that day; it also illustrates a certain facility in David Franks.

Relations between the Colonies and the Mother Country became strained. Political feelings ran high. The lines of division between "American" and "British" began to appear for the first time. At first there was a degree of agreement among all the population, except the government officials, that a protest against governmental abuses was justified and that strong representations should be made in behalf of the Colonists. Even loyalists and imperialists agreed with that. It was a question of domestic politics. But when presently the idea of protest began to develop into the idea of rebellion and independence, a cleavage came. It was one thing to correct the Empire, another thing to desert it. Here is where the people of the Colonies split.

The Franks Family Caught by War

MR. JACOB FRANKS in royalist and loyalist New York, was, of course, royalist and loyalist. As army contractor for the British Government, he had no choice.

Mr. David Franks, down in Philadelphia, was a little nearer the heart of the new American sentiment, and could not be so royal and loyal as was his kinsman north. In fact, David Franks tried to do what is modernly called "the straddle," attempting to side with the Empire and with the Colonies, too.

It was natural. His business was in Philadelphia. He may also have wished to remain as long as possible in the position of a spy, and send information of the state of public feeling to the royalists. Moreover, he was received in good society and his reputation for wealth and shrewdness won him attentions he could not otherwise have commanded.

So, in 1765 we find him joining the merchants of Philadelphia in the pact not to import articles from England while the hated Stamp Act was in force. In 1775 he favors the continuance of the colonial currency.

He was enjoying his accustomed life in the city—and his acquaintance with the Shippen family into which the dashing young Benedict Arnold married.

There is a strange intermingling of all the tragic figures of the play: Benedict Arnold marries the girl for whom Major André wrote a parlor play. Major André, during his period of captivity as an American prisoner of war and before his exchange, was often at the home of David Franks. And David Solesbury Franks, at his post as agent of the Franks syndicate at Montreal, is placed by a strange turn of the wheel of destiny in the military family of Benedict Arnold for a considerable period preceding and including the great treason.

So, for the moment let us leave the Jewish family of Franks—all of them still stationed as we first described them: Moses in England, Jacob at New York, David at Philadelphia, David S. at Montreal—and let us scrutinize the young American officer, Benedict Arnold.

These facts would most of them be lost, had they not been preserved in the Jewish archives, by the American Jewish Historical Society. You will read any history of Benedict Arnold without perceiving the Jews around him. The authors of the accepted histories were blind.

Benedict Arnold Heads Toward His Fate

THE principal defect in Benedict Arnold's character was his love of money. All of the trouble which led up to the situation in which he found himself with reference to the American Government and Army, was due to the suspicion which hung like a cloud over many of his business transactions. There have been attempts to paint Arnold as a dashing martyr, as one who was discouraged by the unmerited slights of the Continenal Congress, as a victim of the jealousy of lesser men, as one from whom confidence was unjustly withheld. Nothing could be further from the fact. He was a man to whom men were instinctively drawn to be generous, but so general was the knowledge of his looseness in money matters that, while admiring him, his brother officers acted upon the protective instinct and held aloof from him. He was tainted by a low form of dishonesty before he was tainted with treason, and the chief explanation of his treason was in the hard bargain he drove as to the amount of money he was to receive for his guilty act.

Arnold's own record makes this clear. Let us then take up his career at a certain point and see how the Franks strand and the money strand weave themselves through it like colored threads.

Extraordinary efforts have been made in recent years to extenuate Arnold's treason by the recital of his daring services. These services need not be minimized. Indeed, it was his great achievement of the winter march to Montreal and Quebec in 1775-6 that seems to begin the chapter of his troubles. To rehearse this feat of courage and endurance would be to tell a tale that has thrilled the American schoolboy.

Arnold's First Alliance With the Jews

IT WAS at Montreal that Benedict Arnold came into contact with the young Jew, David Solesbury Franks, the Canadian agent of the Franks army-purveying syndicate. And the next thing known about young Franks is that he returns to the American Colonies in the train of Benedict Arnold as an officer of the American Army.

How this change was effected is not explained in any of the records. There is a moment of darkness, as it were, in which the "quick change" was made, which transformed the young Montreal Jew from an army contractor for the British into an officer of Benedict Arnold's staff.

But as it is impossible for every fact to be suppressed, there are here and there indications of what might have been, what indeed most probably was, the basis of the attraction and relation between the two. It was very probably—almost certainly—the opportunities for graft which could be capitalized by a combination of General Arnold's authority and young Franks' ability in the handling of goods.

From the day they met in Montreal until the hour when General Arnold fled, a traitor, from the fort on the Hudson, young David Solesbury Franks was his companion.

In one of the numerous court-martials which tried General Arnold for questionable dealings in matters pertaining to army supplies, Franks, who was aid-de-camp to Arnold, and by rank of major, testified thus:

"I had, by being in the army, injured my private affairs very considerably, and meant to leave it, if a proper opportunity of entering into business should happen. I had several conversations on the subject with General Arnold, who promised me all the assistance in his power; *he was to participate in the profits of the business I was to enter in.*"

This testimony was given by Major Franks in 1779; the two men had met in the winter of 1775-1776, but, as the records will show, Major Franks was always General Arnold's reliance on getting out of scrapes caused by questionable business methods in which Arnold's military authority, was used quite freely. Major Franks admits that he was to enter business and General Arnold was to share the profits. On what basis this arrangement could exist, is another point not known. Arnold had no capital. He had no credit. He was a spendthrift, a borrower, notorious for his constant need of money. The only credible inducement for Franks to accept a partnership with him was on the understanding that Arnold should use his military authority to throw business to Franks. Or, to state it more bluntly, the "profits" which Benedict Arnold was to receive were payments for his misuse of authority for his own gain.

A complete opening of the records will show this to be the most reasonable view of the case.

Arnold's First Public Disgrace

IT WAS at Montreal that Benedict Arnold's name first became attainted with rumors of shady dealing in private and public property. General George Washington had laid down the most explicit instructions on these matters, with a view to having the Canadians treated as fellow-Americans and not as enemies. General Washington had cashiered officers and whipped soldiers who had previously disobeyed the order against looting and theft.

General Arnold had seized large quantities of goods at Montreal and had hurried them away without making proper account of them. This he admits in his letter to General Schuyler: "Our hurry and confusion was so great when the goods were received, it was impossible to take a particular account of them." This means only that Arnold seized the goods without giving the Canadian citizens proper receipts for them, so that he had in his hands a large amount of wealth for which he was under no compulsion to account to anybody. This mass of goods he sent to a Colonel Hazen at Chambley, and Colonel Hazen evidently aware of the conditions under which the goods were taken, refused to receive them. This disobedience of Colonel Hazen to his superior officer, especially in a question relating to goods, made it necessary for Arnold to take some self-protective action, which he did in his letter to General Schuyler. Meantime a very ugly rumor ran through the American Army that General Benedict Arnold had tried to pull a scurvy trick of graft, but had been held up by the strict conduct of Colonel Hazen. Moreover, it was rumored (and the fact was admitted by Arnold in his letter) that in the transfer the goods were well sorted over so that when they finally arrived a great part of them was missing. All the principal facts were admitted by Arnold, who used them, however, to throw blame on Colonel Hazen. He even went so far as to prefer charges against Colonel Hazen, forcing the matter into a court-martial. The court was called and refused to hear the witnesses chosen by General Arnold in his behalf, on the ground that the witnesses were not entitled to credibility. Whereupon General Arnold flouted the court, who ordered him arrested. General Gates, to preserve the useful services of Arnold to the United States Army, dissolved the court-martial, to that extent condoning the conduct of Arnold. Before the court-martial dissolved, however, it informally acquitted Colonel Hazen with honor.

Setting the Stage for Treason

HERE, then, almost immediately, as it would seem, upon his new connection with David Solesbury Franks, Benedict Arnold is involved in a bad tangle concerning property which had come into his possession irregularly and which disappeared soon after. His attempt to throw the blame on an officer whose disobedience was the factor that disclosed the true state of affairs, failed. It was his bold scheme to forestall an exposure which must inevitably have come.

While it is true that on this Montreal case, no verdict stands recorded against Benedict Arnold for the theft of goods, it is also true that the American Army became suspicious of him from that day.

Had Benedict Arnold been innocent then and had he kept his hands clean thereafter, the Montreal episode would have been forgotten. But as a matter of fact such affairs came with increasing frequency thereafter, all of them, strangely enough, involving also the Jew whom he associated with himself at the time of that first exposure.

The story of this Jew's relations with Benedict Arnold all through the period ending with the great treason, may now be taken up with greater consecutiveness, for now their formerly separate courses run together. In another article this relationship and all that it meant will be illustrated from the government records.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages, respectively, sent to any address upon receipt of 25 cents for each volume.

Can the Span of Human Life Be Lengthened?

By GEORGE HENRY HEALD, M. D.

IN THE first place, what is the span of life? Is there a period set by nature—a bound beyond which man may not pass? Is there something in his very being that determines that within a few short decades at most he must age and pass on? Is the "three-score and ten" of the Bible a limit beyond which the average man cannot expect to live?

These and similar questions have been asked of old, and are still being asked. The possibility of increasing indefinitely the span of life has long been an attractive theme. Only recently, Bernard Shaw has issued a series of five plays, entitled "Back to Methuselah," in which he attempts to teach how man may lengthen his life to 300 years or more. In the early days of this continent—the days of discovery and exploration—one Ponce de Leon traveled far and wide, searching for a fabled fountain of immortal youth, and his search was but the expression of the wishes and hopes of many of his day.

There are a number of seemingly well-authenticated cases of persons who lived to be 120, 130, or even 140 or more; but those who have studied most thoroughly into the subject are inclined to doubt the accuracy of such reports, for they do not succeed in finding any cases in which incontestable proofs of the great age can be found; and in those cases in which it is possible to get exact data, they always find that the age has been greatly exaggerated. Only recently an old Kentucky mountaineer was exhibited by interested persons as being more than 130 years old, and they seemed to have made a pretty clear case of it. But a New York physician, who had doubts as to the accuracy of the reported age, made the rough trip into the Kentucky mountains at considerable expense, and there among the old settlers, he obtained positive proof that the decrepit man, who was partially demented, was only about 100 years old. He had been coached by his exhibitors to say that he was more than 130. Students of longevity are inclined to believe that the instances of life much beyond the century mark are much more rare than the extant stories of extreme age would indicate.

Life tables are prepared by officials of the life insurance companies, based on the lives of their policy holders, and also by Government officials, based on mortality statistics, showing the life expectation at different ages, for different classes of persons. For instance, some insurance statistics show a greater expectation of life for those who are total abstainers from liquor than for moderate drinkers, and a greater expectation for moderate drinkers than for steady or hard drinkers. As fire insurance companies give a better rate on buildings of slow-burning construction than for ordinary buildings, so certain life insurance companies give better rates to abstainers than to drinkers. These better rates, usually in the form of return dividends, are based on the actual saving of life among the abstaining policy holders.

These insurance companies have shown that if one desires to live long he should abstain from liquor. It is true that occasional instances are cited of drinkers living to a great age; but the statistics computed from millions of individual lives show that such cases are exceptional. The average drinker is a short-lived person as compared with the average abstainer. Temperance, then, or rather abstinence, is one means of lengthening life. Are there others? It is the purpose of this article to discuss this question.

The Bureau of the Census has published a series of life tables based on the estimated population July 1, 1910, and on the reported deaths in 1909, 1910 and 1911, for the original registration area, and for the different states, for various classifications of the population. The accompanying abbreviated table gives figures taken from these official life tables, which show that the life expectation varies with sex, race, location (city or country) and nativity (whether native or foreign-born). For instance, women, except those in rural districts, are longer-lived than men; whites are much longer-lived than Negroes; and native-born are slightly longer-lived than foreign-born (the latter not shown in this table). Moreover, the tables prepared for different states show striking differences, due probably to the proportion of urban and rural population. For instance, the life expectation at birth for the different states studied and for the original registration states, is thus given:

Your Chances of Reaching a Ripe Old Age

Classification of population, original registration states. SEX	Life expectation at birth—average longevity	Of 100,000 born, number that reach fifth year	Number that reach twentieth year	Number that reach fiftieth year	Age at which half of original number are still alive
Both sexes	51.49	83,887	80,074	62,460	60-61
Males	49.86	82,718	78,792	60,118	58-59
Females	53.24	85,117	81,418	65,001	62-63
White Males	50.23	82,972	79,116	60,741	59-60
Females	53.62	85,349	81,750	65,629	63-64
Negro Males	34.05	68,589	61,426	35,427	34-35
Females	37.67	72,768	64,764	40,886	40-41
CITY					
White Males	47.32	81,185	77,122	56,913	55-56
Females	51.39	83,374	79,962	63,058	60-61
COUNTRY					
White Males	55.06	86,223	82,674	67,734	65-66
Females	54.70	86,536	82,648	66,735	64-65
NATIVE					
White Males	50.58	82,722	78,923	60,772	60-61
Females	54.19	85,121	81,526	65,723	64-65

Life Expectation at Birth

	Male	Female
Indiana	54.70	56.16
Michigan	53.86	56.24
Registration States	*49.86*	*53.24*
Massachusetts	49.33	53.06
New Jersey	49.08	52.80
New York	47.89	51.89

It would seem, then, that, notwithstanding the cities have done much to lower death rates, and that sanitation in the cities is much more perfect than in the country, it was safer to live in the country than in the city in 1910. It is possible that the improvement in city sanitation in the last 10 years may give a better showing for the cities in later life tables.

How are we to account for the better life expectation in rural districts than in the cities? Is it due to the fact that people in rural districts as a rule live a more simple and natural out-of-door life? Such an explanation would account for the paradox that the rural woman is an exception to the fact that females in general are longer-lived than males.

It will be noted from the table that Negroes are very much shorter-lived than the whites. Is this a racial characteristic, or is it incident to the fact that on the whole the Negroes, because of poverty or ignorance or both, live a much more unwholesome life than the whites? The Negro is peculiarly susceptible to tuberculosis, and the tuberculosis mortality among this race is exceptionally high. On the other hand, the Negro is comparatively immune to malaria and to the effects of hookworm disease. That is, these diseases are much lighter with the Negro than with the whites. These racial differences as regards different diseases suggest that there may be a racial difference in longevity, independent of the fact that the Negro as a rule lives under more unfavorable conditions.

In addition to racial differences in longevity, there are apparently also family differences. It is a matter of common observation that certain families are unusually long-lived. Physicians, when they desire to express opinion as to the outcome of a doubtful case, inquire into the family history. If the patient is of a long-lived race, or family, the outlook is better than if he is of a short-lived family.

In the city people commonly turn night into day, and possibly live through as much in five years as country people live through in 10 years. It is not at all surprising that an automobile that runs 10,000 miles a year, other things being equal, will wear out sooner than another machine that runs only 5,000 miles a year.

These are some of the factors that have to do with the problem of longevity. Then there is the general question of germs and infection. About 40 years ago, the discovery was made that disease is often caused by minute organisms, known as germs, or bacteria. Later, other microscopic organisms belonging to the animal kingdom, were shown to be the cause of certain diseases, such as malaria, yellow fever and sleeping sickness. For a time the germ theory overshadowed everything else, and disease prevention was reduced to the simple problem of swatting the germ. Latterly it has become apparent that swatting the germ is more than a man's job, and is practically impossible of accomplishment. That is, the tuberculosis germ, for example, is here with us to stay, and no amount of fumigation, or disinfection, or sterilization will get rid of it. We have also learned that this germ is not such a terrible fellow after all. It will take quarters with a person for a lifetime, and does in many cases, without doing much damage. We have learned that while it is important to limit the spread of disease germs as much as possible, and to prevent their propagation, the surest protection against germ invasion is a sound body. And a sound body is very largely a matter of proper nutrition.

The Future of Food Growing—By F. B. NICHOLS

DESPITE the economic ills with which agriculture is now confronted, it is evident that the business of growing food is on a secure basis. The farms are going to produce crops large enough to meet the demands of the cities, and at fair prices. Through the use of improved machinery and the growth of the co-operative movement in marketing, it will be possible for the producers to do this and get a fair return for their toil. We are just at the beginning of a great extension in the use of improved implements—the era of machinery is here! This movement, by the way, is typically American.

The man production from the farms of the Great Mississippi River Valley has long been the wonder of agricultural students the world over. It is, for instance, about three times the production of the average French farmer, and the contrast is even more encouraging when compared with the producers of India or China. But it is evident that it can be increased still further, through the use of good tools. For the farmer this will mean larger returns, and at a lower expenditure of physical labor. For the laborer in the industrial centers, it means ample supplies of food, at prices he can afford to pay.

In the production of grain the benefits of improved machinery have been especially evident. It is a long way in the economic evolution of the human race from the "man with the hoe" and the cradle, to the man with the tractor of today. In this connection it is evident that the artists who have been showing the farmer as merely one who toils with his hands should get more of a modern version of things. This progress which farming has made has been shown by a huge increase in production, that is steadily developing with the years, and which will continue to grow. More than that, the work is much easier. Man has been able to invent few forms of drudgery more difficult than harvesting grain with a cradle. What a contrast to the modern farmer, who "knocks down" 25 acres a day with a tractor hitched to an eight-foot binder! And the combination harvester-thresher, which harvests and threshes the grain all at one operation, makes an even more pleasing contrast.

As a rule, the farm implements of today have been developed with the best methods of soil management in mind. Take with tractors and wheat—the great bread crop—for example. If the best yields of winter wheat are to be grown, the soil must be plowed deeply and as soon as possible after harvest, which means in July in the great surplus grain-producing states like Oklahoma, Kansas and Nebraska. Naturally the weather is warm—perhaps hot would be a better term ——at this time of the year, and when the horses must supply the power the acreage which can be covered with each individual outfit is small. This is a tremendous handicap in the more important wheat sections, where the grain acreage on almost every farm is large. The net result is that where horses are used the plowing is continued until along in the autumn, and much of the crop is planted on seed beds prepared in a very inefficient way.

But how different it is when power work is the rule! The farmer gets the tractor started as soon as possible after the wheat is off the ground, and he makes some real speed. There is no stopping for a "breathing spell" as there is with horses; the tractor goes right ahead through the heat, with only an occasional stop for fuel, water and oil, for many hours every day. And this relieves the horse—man's friend—from one of the worst forms of killing work known. Many wheat growers put a headlight on their tractor and run it day and night, and naturally cover an immense acreage.

The work is done properly; six inches or more is a common plowing depth; and the conditions are made favorable by this early, deep plowing for the forming of available plant food, and, of course, the moisture is conserved, for the surface is broken. After the plowing is finished it is important that the soil be cultivated enough, usually with a disk, to keep the crust broken and the weeds killed. As a rule this work is done with a tractor when one is available; the lighter engines are especially well adapted for disking and harrowing.

When a field is handled in this manner, the soil usually is in ideal condition in the autumn for the crop, and the plants make a quick growth after sowing. They thus go through the cold weather with a minimum of winter killing. As a result they are in a favorable condition to make a quick start the following spring toward maturity and a high yield.

Then when the crop is sold in a co-operative way, either by a local association or as it will be largely in the future, through a powerful commodity marketing association, such as the proposed United States Grain Growers, Inc., we have almost an ideal production and sales system. Intelligent production and efficient selling are the two things which guarantee fair prices to the producer and buyer, in both country and city.

The general distribution of tractors because of the, real power supplied, has done much to encourage the use of other forms of big machinery, such as silage cutters, power cultivators, large binders, tile-ditching machines and the like.

When a State Goes A-Fishing in the Ocean

Government's Part in Industry Producing $25,000,000 in Food Yearly

HOW well it pays, in dollars and cents, as well as in industrial and commercial advancement, for a state to take charge of its resources, direct and develop them is shown this year in the taking of first place among all the states in the fishing industry, by California, with a production of sea foods valued at more than $25,000,000. How much more the development of trout and salmon streams and bass streams were worth in the advancement of the health and recreation of the thousands who fished them for sport, there is no means of estimating.

Working without salary for half a century, the various men, who have succeeded each other on the California State Board of Fish and Game Commission, appointed by the governor with the approval of the state senate, and serving at the pleasure of the governor, have established 22 fish hatcheries to maintain forever the supply of fresh and salt water food and game fishes. How many fish have been planted in the streams and lakes, bays and bayous of California it is impossible to estimate even approximately, but from these planted fish in 1920, $19,202,318 was received for canned and packed fish alone, while the value of the fish consumed in its fresh state is placed by the statisticians of the state government at more than $6,000,000 more. This total is approximately four times the total sum spent by the commission on the development of the state's fisheries, since it was established, with an appropriation of $5,000 fifty years ago.

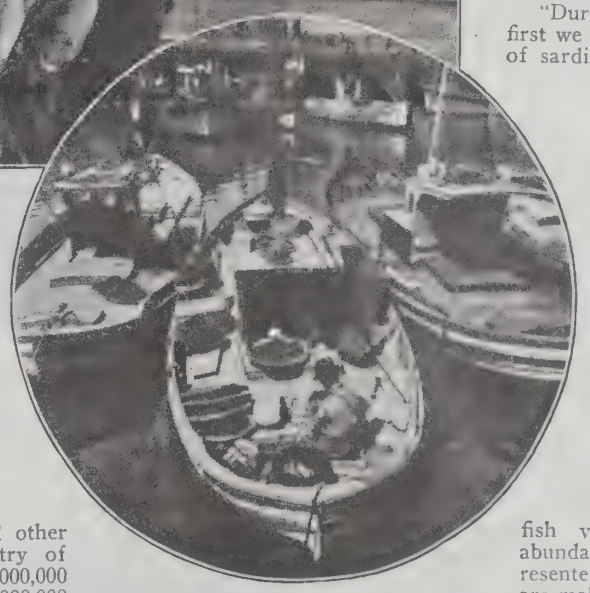
Since that first year, the commission has been self-supporting, and, in 1920, the year for which figures are now available, it handled $460,000, every cent of which went for the further advancement of the fishing industry, and the greater development of the fish supply of the state.

Seldom, if ever, has any state government developed for its people an industry which can be compared in practical returns to this, and it is estimated that, with the work of the fish hatcheries now going on and the careful supervision now being given to the commercial side of the industry, next year's figures will show that the 1921 "fish crop" was even more valuable than that of 1920.

Some idea of the extent of the industry, built up under the supervision of the commission and with its aid, may be gained from the fact that, in 1920, there were 106 fish packing plants in full operation in California. To man these plants, 7,097 employes were required, while 5,269 were engaged in the catching of the fish. At least 2,500 more men were employed in the handling of the fish and the office work of the business, so that the pay roll of the commercial fisheries of California for last year numbered not less than 15,000 persons.

Though the salmon was saved from extinction in California waters by the action of the state fish and game commission in years gone by, and is today a productive fish of Northern California waters, the sardine and the tuna take the lead in the commercial fisheries. The sardine has been made the subject of some interesting figures by Frank M. Newbert, of Sacramento, president of the commission, who, in making his report for 1920, said:

"There were 1,062,996 cases of sardines packed in California in 1920. These cases contained 55,462,738 cans, which, if laid end to end, would reach 4,097 miles, or one and one-half times across the United States at its widest part. To fill these cans, 463,055,924 sardines were hauled from the briny deep. If these little fish were laid end to end, they would form a line 3,877,193,016 inches long, or about two and one-half times the distance around the earth.



"The tuna packed in California during 1920, numbered 835,645 cases, containing 42,781,688 cans, which, laid side by side, would have reached 2,025 miles, or nearly from San Francisco to New Orleans, following the railroad route, while the tuna which went into these cans numbered 1,002 774, which, if laid end to end, would have reached from San Francisco to Los Angeles.

"We started this commission fifty years ago, with an appropriation of $5,000. Today, the income of the commission is more than $460,000 annually. We have 22 fish hatcheries and many stations, and these are being enlarged constantly, to meet the ever-increasing demands of the sportsmen who love lake and river fishing and the out-of-doors. To do this we have to keep constantly ahead of the automobile with the pack mule, to insure the anglers plenty of game and food fish in every stream and lake in the state."

Regarding the purposes of the commission, Mr. Newbert says:

"It is the aim of the Fish and Game Commission to increase the stocking of the lakes and streams with fish every year. We have 10,000 lakes in California, all of which one day will be stocked with game fish. We have 100 unnamed mountains, all of which are more than 13,000 feet in height. We have plenty of game and plenty of fish, and it is the purpose of the commission to insure the conservation of the fish for future generations of anglers, and, at the same time, to give the present generation plenty of health-giving recreation and plenty of fish food. The commission is self-supporting, and, contrary to some opinion, none of the commissioners, M. J. Connell, E. L. Bosqui, or myself, receive a cent in salary. Our expenses do not amount to more than $20 a month to the state, though I know that all the commissioners actually do spend more than this, but they do it out of their own pockets."

Upper left, circle—A corner in the harbor devoted to the sardine fleet in San Francisco Bay. Center—Unloading a catch of sardines at one of the several canneries at San Pedro, in Southern California, where are located the largest sardine packing plants in the world. Lower right, circle—Baiting 700 feet of line. A salmon fisherman in San Francisco harbor preparing for the next day's work. One of his lines has been baited and is coiled at the entrance to the cabin. Four other lines are seen coiled on their plates, ready to be baited, at the left of the fisherman.

It is estimated that between $8,000,000 and $10,000,000 of private capital is invested in the fish canneries, packing plants, boats, seines and other equipment of the fishing industry of California. More than 150,000,000 pounds of sardines and 30,000,000 pounds of tuna are taken every year, this total of 180,000,000 pounds of these two varieties being greater than the total of all other varieties of food fishes taken in the 12 months. It is, of course, impossible to estimate the amount of game fish taken by sportsmen in the streams and lakes and on salt water. There are 12 large and modern sardine canning plants on Monterey Bay, in Northern California, and 40 sardine and tuna canneries in Southern California, located at San Pedro, Wilmington, Long Beach, Newport and San Diego. All are prospering and are accounted among the most successful industries of the state. The 1921 output of these canneries probably will find a quicker and more eager market because of the fact that the Alaska salmon pack is reported as only about 60 per cent of normal, and will fall below the 4,500,000 cases packed last year, which was under the average annual pack by many thousand cases. In this connection, it is interesting to note that the California commission in the past two years has distributed 29,000,000 young Chinook salmon in the Sacramento, Klamath and Eel rivers. Incidentally, and so that the mountain-loving angler might not be disappointed in years to come, 34,000,000 trout fry were reared and planted in a number of streams in the same period.

So important is the Fish and Game Commission considered, and so great attention does the state of California pay to its commercial fisheries, that the commission has the power to compel the various packing and canning companies and all other corporations or persons engaged in the purchase of fish from the commercial fishermen, to keep an accurate record of all fish purchased, the source, condition, how caught, date; in fact, all data covering all the fish taken during a season. A state fisheries laboratory is maintained, in which all this data is filed, correlated and studied, in a vast general program of protecting, conserving and increasing the supplies of commercially valuable fish. Thus, for example, the sardine, the most valuable fish, commercially, in California waters, is known to have appeared in commercial quantities off the coast of California in 1914, and in the North Pacific was regarded as a curious stranger when caught occasionally among the herrings, up to two years ago. "Such data, carefully substantiated, leads to the belief," says W. F. Thompson, of the California State Fisheries Laboratory, "that the sardine fishery is subject to great fluctuations, because, if the sardines were lacking once in these waters, they well may be lacking again, not only in British Columbia, but in California. So, the most ordinary business sense dictates an energetic inquiry into the probability that such great changes will occur in California, and into the chance of foreseeing them. The great natural changes in abundance may be so overwhelming as completely to overshadow depletion. To the changes in abundance, then, we have addressed ourselves along lines suggested by the phenomena in the herring and other fisheries."

Thus, it will be seen that the state of California has found that not all the success of her $25,000,000 fisheries is due to the methods of taking them from the sea, but that the life histories of the fishes, their movements, their migrations, their food and their feeding, their spawning and their young, must be studied, and the harvesting of this crop so controlled that it may be of value not only to this generation, but to all generations to come.

One of the interesting problems now being considered in connection with this sardine fishery—which took, let it be remembered, 150,000,000 pounds, or 75,000 long tons, of fish from the California sea in 1920—is stated as follows by Mr. Thompson:

"During last season, the first we investigated, the group of sardines we may regard as being in their fourth year, predominated and made, at Monterey, a good pack for 'half-pound oval' cans, much as the dominating class in our diagram was in 1904. Will this year's catch be of fish one year older? And will next year's catch be of fish two years older? Or, will the catch continue to be of the same size, and equally good for packing such cans? In other words, do the age-groups of fish vary widely in their abundance, as we have represented in the diagram we are making, and will the fishery vary between success and failure with their growth in size, and with the presence or absence of a successful year? The packer, wondering whether the fishery is to remain good, and whether he will be able to pack 'quarter-oil' sizes, or obtain good 'half-pound oval' sizes, naturally wishes to know the answer. Perhaps, when we know the exact rate of growth, we may be able to prophesy very exactly the character of the catch. So we are concentrating on age and rate of growth of the sardine."

To solve this problem which, to the layman may seem rather simple and uninteresting, yet which is of vital importance to an industry worth $25,000,000 every 12 months and growing by leaps and bounds, two men are stationed on the California coast, one at Monterey and one at San Pedro, centers of the sardine fisheries, whose duty it is to do nothing but take samples of every boatload of sardines brought in to the canneries. These samples must show the average age and size of every cargo of sardines taken from these waters, and are turned over to the state fisheries laboratory for comparison, tabulation and analysis, so that, eventually, the California State Fish and Game Commission will be able to say to the sardine fishermen and canners: "This year you will get fish of such-and-such size, in such-and-such quantities; therefore prepare yourselves accordingly for the catch."

Taking Health to Kansas in a Railroad Car

By FRANK M. CHASE

PULLMANS have carried many persons to health, but one doesn't need an adding machine to count those that are taking health to the people. There are only four of these. One is the Warren, the health car of Kansas.

In 1915 the Pullman Company presented an old observation car to the State Board of Health. An appropriation for remodeling and equipping it was obtained, and maintenance funds have been granted. Its name is in memory of the son of Dr. S. J. Crumbine, secretary of the board, who died in China in 1916. The car has been in use five years, during which it has literally taken health to thousands of Kansans.

Yearly itineraries for the car are arranged. The first four of these consisted of rough loops into each corner of the state, the plan being to reach the remaining communities by a series of shorter trips. Formerly the car stopped at almost every station, and the stay varied from one day to two weeks, according to the size of the place. Owing to the increased cost of mileage and moving the past year, stops were limited to towns of 500 population or more. It has made two small towns or one large town a week.

At least two attendants always accompany the car, one of whom is a public health nurse. During the first two years the force consisted of two nurses and one helper, one of the nurses being contributed by the State Tuberculosis Association. Lack of funds prevented the continuation of this arrangement, a woman physician and one helper then operating the car. The helper sometimes has been a student of social service, sometimes a nurse, sometimes only a capable woman. The past year the car was conducted by a public health nurse and a social worker, Miss Edna Burch.

The management of the health car, so as to present its message most effectively, suggests the method and directness of a circus organization. Advance publicity is obtained by letters to the mayor, city and county superintendents of schools, a leading club woman or two, health officers and newspapers. These letters explain the purpose of the car, give the itinerary, and solicit co-operation. Data are provided for newspaper publicity. On arriving at a town one of the workers calls on the editor of each local paper, to determine what publicity has been given and to ask and aid him to continue it during the stand. Attractive framed posters are placed in the store windows, while to reach the rural people the telephone operator often gives a line ring, then tells them of the car. But the most effective means of bringing persons to the car is provided by the children. Special attention is given to seeing that the school children of the community have an opportunity to see the car. The city superintendent always is instructed by correspondence to send the pupils, by grades, in charge of their teachers. Each grade spends one school period at the car. The exhibit is explained, and usually all the children are weighed and measured. When time and the size of the group permit, the mouths also are examined. Then, before leaving, they are urged to tell every one they know about the car and to bring their parents.

And the parents come. One-half the visitors are adults. One farmer brought his family 25 miles purposely to see the car. A rural school came 18 miles in a truck. While the schools are in session, the mornings are reserved for them, while in the afternoons, and often the evenings, the car is open to all who wish to come. Usually it is kept open one or two evenings at each stand. Often from 600 to 800 persons visit the car in a day, it being well filled from nine in the morning until late at night. The average attendance for the seven months in which the car was in actual operation last year was about 350 a day.

As the work of the car is mainly with and through the children, its exhibits have been adapted to the understanding of young minds, the aim being to make the object lessons intelligible and interesting to the child of the fourth or fifth grade. For the same reason little attempt is made to operate the car while the schools are closed. The appeal of the exhibit to the children is remarkable. They grasp every lesson of the car, whether of personal, school or community interest, and then go home and tell their parents about it.

At one town, the car arriving on Saturday, it was found that the principal of the school had neglected to advertise the car. As the school was closed, it was impossible to reach the children. But the 10-year-old son of the mayor, who evidently was well schooled in civic matters, rose to the occasion. At intervals he came to the car, carrying one or two children on his bicycle, while several more followed in his wake. The car physician taught him to measure and weigh. With an assistant he took down the weights of the children. When he found one underweight he would say, "March over to the doctor and open your mouth. She'll see what's the matter with you." Throughout the day the youngster worked at his self-appointed task. And many of the parents, interested by the enthusiasm of the children, came out in the afternoon to view the exhibit.

In another case where the car arrived in town Saturday morning and there had been no publicity, the first visitors were a group of boys idling in the railroad yards, whose curiosity got the better of them. Once inside the car, however, their eyes opened wide with interest. "Go and tell every boy you can find to come to the car," said Miss Burch, seizing the opportunity. The boys left and soon, by means of the freemasonry of a town's boyhood, groups of youngsters were trailing through the car, listening to Miss Burch's explanation of the exhibits and permitting the nurse to weigh and measure them and examine their

Upper, left—General interior view of the Warren, the health car operated by the Kansas State Board of Health. Upper, right—On entering, numerous lessons on what and how to eat greet the visitor. This is the front end of the car. Lower—Mother's conference. More than 60,000 persons saw the health car last year.

mouths. But they were not all. Again their mothers and fathers and aunts and uncles came in the afternoon, and before nightfall the car and its attendants, despite the lack of advance notices, had done a very creditable day's work.

"Health, Strength, and Joy for all the children of all the people." This motto, displayed conspicuously at the rear of the car, expresses the spirit of the exhibit, as in it are health lessons for every one. Along the left side, as one enters, are seen graphic studies in foods, milk, teeth, tonsils and adenoids, child care, weighing and measuring, school hygiene and sanitation. Coming back on the other side, are found the quarters for examining mothers and babies, then the sections devoted to tuberculosis, communicable disease, personal hygiene, infant and prenatal care, exercise, posture and clothing, homemade play grounds and fresh air—a thorough course in health, all making for the welfare of childhood.

In the food section the child and its mother see several samples of well-balanced rations. Passing on to the milk exhibit, it is learned that milk is indispensable in the child's diet and that a quart of it is equal in body-building ability to two and a half pounds of chicken or a pound and a quarter of beef.

Under communicable diseases it is shown that 312 deaths from measles—"nothing but measles," as the uninformed often say—occurred in Kansas the preceding year, and that the state lost more residents through whooping cough in the same period than by scarlet fever, diphtheria and smallpox combined.

Let one of the eighth grade girls of Goodland describe the exhibit, as she did in some written work at school after the car's appearance at that town:

"Upon entering the car you are under the impression that you are visiting a display of doll houses. But they are miniature tuberculosis cottages. They show how those afflicted with this disease should live. In these houses or on the porches are miniature cots such as tubercular patients should sleep on. Fresh air, nourishing food and rest are the best cures for tuberculosis. A map showed the number of cases of this disease in Kansas. It was very strongly impressed on us that tuberculosis is a curable disease and a preventable one.

"We passed on and were warned as to the danger of the many contagious diseases. We learned that there have been many more deaths from measles than from scarlet fever in Kansas, though scarlet fever is much more feared. People do not use enough precaution with measles or other diseases that are catching.

"On the other side were foods both helpful and injurious. One thing which attracted our attention was a quart of milk which had ribbons fastened from it to different plates of meat, to show that one should get as much nourishment from one quart of milk as from all these meats.

"We then saw where they had displayed best amusements and comforts for children and babies, also proper clothing for babies. We were then weighed, and found we have one perfect girl and one perfect boy in our class."

A fourth grade boy, showing that the car's message was not lost on the younger visitors, wrote:

"This was a health car. Dr. Crumbine sent it out into Kansas to prevent people from getting diseases. We should get plenty of fresh air by sleeping on the porch and leaving our window open at night so we won't get tuberculosis. I do not want to have tuberculosis. The germ might live in an old dirty house. If we let tuberculosis go too long it cannot be cured, and if you eat healthy foods and get plenty of fresh air and right kind of exercise it can be cured.

"We should breathe through our nose. If we breathe through our mouth it will make our teeth crooked. We should wash our teeth to get all the food from out of between our teeth. We should be careful of the water, because it may have germs in it.

"A well should be placed on a high place, because the germs won't get in the well. Flies carry many germs. We should poison a fly. Milk is our best food. Our food tables should be clean. We should eat less meat and more vegetables. You should keep your body warm in the winter."

The exhibit elicits many questions, in the answering of which the car workers give much personal service. Whenever possible, the requested information is supplied directly; otherwise the visitor is referred to the proper state department. Questions concerning diet lead in number. "I am asked how to get thin a dozen times a day," said Miss Burch, "while a great deal of interest is shown in sanitation, tuberculosis, communicable diseases and shoes for women."

Mothers receive help with their individual difficulties which otherwise they could not obtain. Many instances of pathetic ignorance on the part of mothers and tragic handicap to their children come to the car. Parents sometimes drive miles to get this coveted advice. To accommodate them the car is open in the afternoons especially for the mothers and fathers with children of the pre-school age. A special effort is made to examine these children and to confer with their mothers. The car physician or nurse attends to such examinations, while the assistant is explaining the exhibit to the other visitors.

Results often follow swiftly the appearance of the car. This is not wholly accidental. Usually a conference of leading citizens is held on the car the first evening of its stand, at which the local situation is discussed and it is determined how the car can best serve that particular community. Public meetings frequently are held, a speaker or a film being sent from the board of health office, or one of the car workers is invited to address a club gathering.

At home the lessons of the health car are promptly translated into better habits. A father once reported that when he and his wife retired to the second floor for the night, a blast of cold air struck them. "Mercy," he said, "what's the matter up here?" "Oh, nothing," replied his wife. "The children have been to the health car."

The health car traveled 1,000 miles last year, and more than 60,000 persons saw the exhibit. And it cost the state of Kansas less than six cents to deliver the powerful message of health to each of the visitors.

Can a Woman Go a Journey?

By GEORGIA JACKSON

IN THOSE otherwise delightful "Walking Stick Papers" of Robert Cortes Holliday, there is, alas, one flaw. A woman, he says, cannot "go a journey," and he makes this masculine mispronouncement casually, even amiably, with an air of finality. Now, as a matter of fact, of course, a woman can go a journey, and joyously. Many a holiday have I taken à la carte on the highway or bypath. And, moreover, a woman may be the most humdrum person in the world, but the moment she puts on a khaki suit and takes to the open road, whimsical adventures flock along her trail and swoop down on her at every turning.

For instance, there was my first visit to Tarrytown along the Old Post road, past heavenly mansions and still more heavenly grounds, on a Saturday afternoon quite in tune with my high spirits. No sooner had I arrived in the pleasant streets of the town than I happened on the statue commemorating the capture of Major André, and stopped to look it over with what I considered due reverence and curiosity. All of a sudden I became conscious of another gazer—a diminutive individual. When he caught my sympathetic eye he raised his hand and exclaimed with some histrionic ability, "This is the most sacred spot in American history!" And in the next breath he told me he had come all the way from Boston to see it. I should have guessed that, anyway.

An amiable idler set me on my way to Sleepy Hollow. There was the church, right where Ichabod Crane had left it so precipitately. The sunshine made a smile on its plain face. The slats in the quaint shutters were open enough to let me peek in at the white, brown-trimmed pews and curious wooden pulpit with its winding stair. The grave stones in the old churchyard were crumbling red and white, and I prowled around among them, reading their dried-prune poetry.

I discovered a hospitable pump, filled my little aluminium dish-of-all-work, and looked about for an appropriate mess hall. There it was, some little way from the churchyard—a clump of trees shading an old two-wheeled affair that might have carried a cannon in the Revolution and again might not. It looked rather too young and agricultural. But it suggested itself as a proper place to cook coffee, so I carefully deposited my dish of precious water at the wide end of its tongue and then seated myself on the tongue. You would have thought that in all the time since the Revolution or the last harvest somebody else must have sat on that very evident resting place. But no. The tongue promptly swung down and dumped me and the water on the ground. Before very long, however, my can of solidified alcohol was spluttering, and the coffee proved entirely tractable. Is there anything in this world, I wonder, so good as coffee cooked—and drunk—in the open air? After two chicken sandwiches I felt so energetic I started on again. I had been figuring that it would be amusing to sleep in Sleepy Hollow churchyard if I could manage to do it without being caught, and then attend the services in the old church Sunday morning. But, luckily for me, as it proved, when I got to the railroad path along the very river edge, I decided that the evening was too lovely to be spent idling about Tarrytown. Tarrytown would wait, and the sunset wouldn't. I tramped along the solitary path for some time, consuming quantities of balm. Who am I that I should try to tell what the Hudson and the hills can do in the way of a sunset, with rain clouds gathering and sun rays streaming over their gilded edges into the blueness?

The clouds rolled up heavier, and the lightning began to slit them with gold. One has to be sensible. Thunder storms are so beautiful and exhilarating—it's too bad they are so wet. I crossed one of the frequent bridges over the railroad—they all looked alike to me—and followed a road into the woods.

Well, it turned out to be one of the most alluring roads I have ever seen. Great slender trees, a gurgling, tinkling brook with little rustic bridges crossing it, shrubs and bushes lining the way, lightning flashes above the trees, where the sky showed dimly, and, best of all, deep within the dusky aisle, among the bushes, over the spring, down the road—fireflies! Such tiny wisps of light! It was a good world. A short distance beyond I came to a small lake with ducks and swans swimming in it. Presently I noticed a small house and a big gate. I went up to the householder.

"Is that a private estate?" I asked, pointing to the gate.

"No," he said. "That's the road. This is a private estate you're on."

"Oh," I said. "There were no trespass signs."

"No, there aren't any."

And I thought it was very pleasant that at least one rich man didn't show people out, but shared his treasuries with stragglers like me.

The kind gateman was worrying. "I'm afraid you're going to get wet," he said. It did look that way. He hurried me off to a wide stone arch over the road and told me the bus to Ossining would soon pass right under it. So I sat down on the floor under the arch, and the rain began to pour. It was dark by that time. Automobiles passed occasionally. It was interesting to watch them come. First a slender streak of light picked out the wet stone edge of the gutter at the curve of the road; it crept slowly along, then a glow followed, growing sudden and vivid, and finally breaking into a glare, a whir, and a whiz past me. Soon a red light announced the bus, and I climbed in.

At Ossining I found a pleasant little inn, more than a century and fourscore years old, a cool, pink-papered room, and the most restful sheets imaginable.

I was on my way early Sunday morning. There was a sharp curve and a worried traffic cop. He didn't know when there would be another bus. He turned from me and deliberately stopped a passing automobile.

"Here," he said to the driver, "take this woman to Peekskill with you," just like that! And to me, dumfounded, he said, "It's all right. He's a friend of mine. You'll be perfectly safe."

I was likewise very happy as we sped along over the picturesque road, the gentleman pointing out spots of interest. I noticed that the country seemed to be thickly populated—or rather thinly populated—with many playwrights. The man was a winsome person with eyes that crinkled at the corners. I thought he was a westerner by the honesty of his r's and the frank unconsciousness and friendliness of his manner. Surely enough, he told me presently that he was from Wyoming. He dropped me at Peekskill, and there I found a small launch going over the river to Bear Mountain. It was a lovely run in the sunny blue morning, a fine bright breeze blowing and little moving white clouds casting deep green shadows over the mountain tops.

The climb up the mountain was stiff, because, as usual, I followed the wrong trail. But it was fine, anyway. If I had gone the right way I should have missed something. There was a reservoir marked 'Preserved for drinking water, keep it clean." That water did look clear. There was a board about two feet long drifting in it, and on the board were seven green frogs sitting cheek by jowl in nicely graduated order gazing at the universe. They were as calm and meditative as seven little Buddhas. I stayed with them for a minute.

My hat began to be troublesome. I stuck it in my belt, and the first thing I knew, it wasn't bothering me any more. Going back to look for it didn't appeal to me. Up and up I went, in sunshine and shade, stopping to rest and breathe, to look at the view, or to pick a handful of black raspberries or huckleberries that were loud in their demand for appreciation. Then a fortress of rocks to scale, and I was at the top. It was a rocky plateau girdled with trees.

I had been mourning all to myself that I shouldn't be able to have coffee for dinner, for, of course, there wouldn't be any springs on the top. But what do you suppose I found? It's an ill rain that drips nobody good! In some half dozen little depressions in the rocky surface were tiny clear pools of water, the deepest not three inches. By taking the cover of my tin coffee box I had no trouble in ladling out all I wanted and had enough left to wash my hands and face. There were three stones in a cluster that made an ideal stove, and I built a fire of dry pine needles and bits of bark that crackled and raged in the wind, and I felt like a real gipsy. I found plenty of huckleberries for dessert.

After dinner I had just stretched out on a bed of thick moss to rest and look at the sky, when I heard voices. Evidently I was to have callers. So I reluctantly put my shoes on again and fixed my hair shipshape—just in time! They were two nice men—the sort who go in for athletics in college and never get over it, wholesome Americans, pleasant to have for husbands or fathers or uncles. We compared notes. They had passed my hat, and said it seemed patiently intact. They sat down and began to smoke. It was a delightful party.

They went on, finally, and as the afternoon was waning, I broke camp and packed my knapsack and started homeward. I got one more chuckle. There was a boy with a handsome head and brow and with the direct serious gaze characteristic of one type of our best young scholars. In a moment of abstraction he cleaned his fingernails with the corner of his Phi Beta Kappa key.

It was dark when we reached New York. Though tired, I was happy. Mr. Holliday to the contrary notwithstanding, I had gone a journey.

Striving for Perfection in Production

Government Bureau of Standards Helps Industry to Solve Problems That Are of Great Concern to Mankind

By S. W. STRATTON

Director of the United States Bureau of Standards

DESCRIBING in detail the various scientific and technical problems in which the Bureau of Standards at Washington is engaged would be so vast an undertaking it would lead to a discussion of about every related subject brought to the attention of mankind in the course of the world's progress.

Although many of these problems are highly technical and frequently experimental, there are other problems of very practical and intimate nature whose solution is of the very greatest importance to the public. A better acquaintance on the part of the public of the work involved is therefore desirable.

The subject of standardization in its broad and modern sense involves functions that relate to our general well-being, and concerns more or less directly countless articles and objects that are used by or are of use to every man, woman and child in the country.

Mentioning only a few articles, such as shoe leather —soles and uppers—collapsible tin tubes, sterling silverware, paper, woolens and cotton, satins, baseballs, glues and pastes, printing and writing inks, carbon papers, paints and enamels, optical glass, sirups, incandescent lamps, steel, celluloid, glass, building materials of all kinds, fireproofing and waterproofing, rubber and rubber tires, canning jar rings, spark plugs, motor truck wheels, storage batteries and dry cells, gears, saw blades, knitting needles, oils and dyes, it will be seen that the list is quite diversified. Investigations of electrolysis, radio engineering, building materials tests, acoustic properties of building materials, to say nothing of special military and scientific investigations for the public defense, are constantly being undertaken. But while this work is confined almost exclusively to government needs, the results of the investigations are even more important to the general public and the information is distributed in the form of suitable publications.

Serves as a Testing Bureau

THE Bureau of Standards, serving as a testing bureau for the various departments of the government when called on, as such, is assisting to place Federal purchases on an economical and businesslike basis. The example of the government in such matters has a far greater influence on the public than is generally supposed. The government can do no greater service to the country than to place its own purchases on a basis which may be taken as a standard by the public at large.

Generally this work is to ascertain whether miscellaneous materials when delivered comply with the specifications. This is especially important since such materials are purchased by means of competitive bids, a method resulting in much fraud and injustice unless suitable standards are established and successful bidders held absolutely to this standard in making deliveries.

The standards with which the bureau is authorized to deal may be conveniently classed as standards of measurement, standard value of constants, standards of quality, standards of mechanical performance, and standards of practice. Behind each standard there is a purpose worth understanding and worth remembering.

A sketch of the problems involved reveals at once that the bureau studies about everything that can be of use, and that it is brought home to us, in dollars and cents generally, and in comfort or ease of mind in other instances.

The scientific and technical staff is organized according to the nature of the expert service involved rather than on the class of standards. In the case of the more important technical fields, divisions have been formed dealing more specifically with large and important classes of materials, but many of the purely scientific questions would be handled by respective scientific divisions or jointly with them.

Some of the Problems

THERE are nine such divisions.

The one dealing with weights and measures—probably the subject with which the public is most familiar —deals with length, area, volume, mass, density, pressure and time, including researches on units and standards, measuring methods and instruments, specifications and tolerances, and the standardization incident thereto for inspectors of weights and measures, manufacturers of measuring appliances, scientific and technical laboratories, government bureaus, engineers and the general public.

Electricity: Electromotive force, resistance, current, inductance, capacity, conductivity, insulation, magnetic permeability and hysteresis, radio activity and radio communication, including researches on electrical units and standards, measuring instruments and methods of measurements; co-operation with standardizing committees of technical societies, with testing laboratories, the electrical industries, public service companies, public utility commissions, municipalities and engineers on problems of standardization, including standards of adequacy and safety of service.

Heat and Thermometry: Establishment of the standard scales of temperature throughout the range of measureable temperatures; testing and standardization of thermometers, pyrometers and other temperature-measuring instruments; determination of specific and latent heats, heats of reaction, melting and freezing points, and other properties of materials in the determination of which precise heat temperature measurements are the principal requirements; standardization of calorimeters; production and distribution of standard heat and temperature samples; industrial applications of heat and temperature measurements; determination of fundamental engineering data involving thermal constants; determination of the fire-resistive properties of structural materials; investigations relating to automotive power plants, fuels and lubricants.

Light and Optical Instruments: Spectral analyses; measurement of standard wave lengths; aerial photography; standards and testing of sugar and other materials by optical means; general polarimetry; color measurement and specification of color standards; spectral transmission and reflection of dyes and other materials; design and testing of optical instruments; testing of optical glass; radiometry; investigation of dispersoids; interferometry.

Chemistry: Chemical composition and purity of materials; chemical properties and constants, including researches on methods of analysis, specifications for technical materials, and preparation of pure materials for standardization work for the government and for industrial and scientific laboratories.

Engineering Research and Testing: Operative efficiency of mechanical appliances, accuracy of engineering instruments, conditions affecting their effective use, for example, structure and design as related to durability and efficiency; methods of standardization and tests, standards of performance and fundamental researches on the scientific principles involved in speedometers, pressure gauges, water current meters, anemometers, tachometers, gasoline and other motors, propellers and other airplane parts and materials, and so on.

Structure, Miscellaneous and Engineering Materials: Investigation of properties, use, fabrication and design of structural, miscellaneous, and engineering materials; development of specifications covering the use of such materials; improvement of processes of manufacture; improving present and developing new methods of testing; development of testing apparatus.

Metallurgy: Thermal analysis and structure of metals, heat treatment and its effects on the properties of metals and alloys, including the researches involved in determining the causes of metal failures; cooling and heating curves; the investigation of hardening, annealing, tempering, cementation; the determination of critical ranges; and the preparation of pure metals and alloys.

Studies Automotive Problems

CERAMICS: Development of new uses for clays; replacement of imported by native materials; improvement of quality products; designing and conducting tests for quality; standards of quality; routine tests for government purchases; acting in advisory capacity as to conservation of fuel and transportation for ceramics; acting as clearing house for collection and dissemination of information.

Let us examine a few of the many activities.

An increasing demand on the part of the automotive industry for research in fundamental problems of this industry has developed. This involves the scientific and technical problems related to the design and operation of internal combustion engines and accessories, and the qualities and characteristics of fuel, lubricants, and so on, for use in such engines.

A knowledge of the phenomena which accompany the burning of fuel in engine cylinders is of importance in the design and improvement of such engines. A study of some features of the problem has been in progress for several years. The situation of the country as regards motor fuels is such as to demand greater efficiency and economy in their use. As a part of this program a special research was undertaken to determine what effect of intake manifold temperature and mode of heating on fuel economy and acceleration of typical automobile engines burning commercial gasoline. Results of this research have been made public.

The amount of paper used by the government departments is approximately 50,000 tons annually, and, as it is necessary for this material to be tested to see that it conforms to the specifications under which it was bought, standard methods of testing paper have been developed. This class of work is called routine testing and consists of chemical and physical tests and microanalysis. Paper is tested for bursting, tensile and tearing strength, as well as—in the case of certain papers—for penetration of ink.

Tests have been made to determine the comparative resistance to water of chrome-tanned and bark-tanned upper leather used in making (army) shoes; or the wearing qualities of a number of specimens of satins by means of an abrasion machine recently constructed; or the method of construction, composition, resilience, endurance under wear, and other properties of representative samples of baseballs; or tinned plate intended for export trade for the canning industry but rejected by the purchasers as unsatisfactory; or "non-scatterable" glass—a protective glass, suitable for aviators' goggles and airplane windshields, and so on.

Unusual attention has been, and is, being given to the investigation of textiles. Textiles is rather a broad term and somewhat hard to define, but in general it may be considered to refer to such manufactured articles as fabrics, hosiery, knit goods, felt goods, cordage, twine, laces, braids and embroideries, which are made from a number of different raw materials, including cotton, wool, silk, flax, hemp, jute, and so on. Tests are made to determine their physical, chemical, microscopic, and esthetic properties, the development of new materials, preparation of specifications, investigation of manufacturing processes, and aid in the establishment of a scientific basis for textile testing.

The subject of electrolysis of underground pipes, cables, and other metal structures is one which has been given more attention in recent years than formerly, but it still does not receive the attention in many quarters that its importance deserves. When one considers the enormous value of the pipe and cable properties buried in the streets of cities and forming in many cases transmission networks between cities throughout the country, and considers further that there are very few water, gas, or lead cable systems which are not more or less subject at some points to electrolysis damage from stray currents, it is possible to form a better judgment of the practical importance of the subject.

A Billion Dollars in Pipes

THE water and gas pipes systems of this country alone have an aggregate value at the present time in excess of $1,000,000,000, and, in addition to this, there is a vast extent of underground lead cable systems belonging to telephone and electric power companies and to municipalities. There also are possibilities of trouble in the case of bridge structures, portions of steel-frame buildings, and piers, which are occasionally exposed to damage from this source.

It is not alone the property loss, however, that makes the electrolysis problem one of importance. An important fact is the inconvenience to consumers of water, gas and telephone service due to the interruption of the service when repairs are made necessary by electrolytic damage. Possible interruption of the service of police and fire alarm systems is also one of considerable importance to almost every municipality.

Another important field is the investigation of fire resistive properties of structural materials. The standardization of fire tests is studied; fire tests of structural materials and structures are carried on, as well as investigations to develop engineering data relative to the fire resistive features of building construction; tests of fire retarding devices, and investigations of building codes and fire codes. The object of the investigation is to furnish architects, construction engineers, builders, state and city building bureaus, insurance interests and others with fundamental engineering data relating to the behavior and safety of various types of building material and construction when exposed to different conditions met with in fires.

Every process which is improved through the investigations of the scientific staff of the bureau results in conservation. Thus, if the section concerned with the investigation of internal combustion engines can discover a means for rendering automobile engines even ten per cent more efficient on the average than they are today, it will result in a tremendous saving in the amount of gasoline consumed and will lengthen the time during which this fuel is available for our use. Similar arguments apply to improvements in the making of textiles, paper, rubber and in metallurgical work.

Helps to Improve Quality

IT MUST not be inferred that the Bureau of Standards devotes its activities principally to the interests of the user or consumer. The fundamental facts regarding standards of measurement, quality and performance, for instance, are the very things which most deeply concern manufacturers; they are concerned, either directly or indirectly, with the improvement of methods of production or the quality of the output. And it is on quality as well as on price that competition must finally depend, whether in domestic or foreign commerce.

The use of exact methods and scientific results is the greatest factor in the improvement of quality, efficiency, or the development of new industries. The educational value of the bureau's work in this respect is almost entirely unknown to the general public, and yet hundreds of letters are received, as well as many personal visits from interested parties, seeking information that eventually redounds to the public's interest, economic or otherwise.

In conclusion, I wish to state that the bureau does not compete with private testing laboratories, but endeavors to assist them by the development of standard specifications, methods of measurement, and other matters where uniformity is desirable. In fact, the bureau has the hearty co-operation of manufacturers, engineers and technical societies.

The Bureau of Standards is willing to extend the use of its technical facilities to qualified investigators paid by technical societies and industrial organizations. The plan contemplates that such investigators will work on problems of particular interest to the organization concerned.

Fighting the Devil in Modern Babylon

Over-Emphasis on Sex—The Main Menace to Modern Morals Following in the Wake of the World War

By DR. JOHN R. STRATON

Pastor, Calvary Baptist Church, New York.

IN A FORMER article I related some of the striking and significant facts about New York, giving a cross section view of this, the greatest melting pot of the world. In this article my desire is to diagnose the main disease from which we are suffering in the world's metropolis and also throughout America.

Every war is followed by a wave of immorality, and now, following the greatest war in the history of the race, the widest wave of immorality that the world has known is sweeping the nations. Nothing but a silly and spurious optimism dares to deny this fact. Anatole France, Sir Philip Gibbs, Sisley Huddleston, George Bernard Shaw, Harold Begbie and many other thoughtful observers, frankly and fully confirm this fact.

The main moral menace, in my opinion, is a wrong relationship between the sexes.

To give it a brief biological name, we might call it "sexitis." It is the undue stressing of the entire sex idea in all the relationships of human life. God created man and woman with beneficent purposes. He established certain relationships between the sexes and gave to each sex its appropriate functions and powers, not only for the promotion of individual happiness, but for the propagation of the human race.

And the relationships between the sexes as purposed and planned by God are the holiest, the most beautiful and the most blessed that this world knows. These great forces, springing from congeniality and love, were designed of God to move along lines of innocence and beauty. But the sad truth that we are a fallen race is proved by the fact that even the lower animals are more obedient to God and his righteous laws than men are at all these points.

Now, sexitis is simply a distortion of the high and holy relationships which God has established, and their perversion to base, selfish and unholy ends. We see illustrations of this malady on every hand. We find it in the literature of the day. Many of the novels which attain to the dignity even of "best sellers" are not only full of sickly sentimentality, but of such sordid realism that they ought not to be allowed in the hands of any pure girl or any developing boy.

We find a manifestation of this modern malady in an acute and extreme form in the theater—both in the so-called legitimate drama (now a misnomer) and in the movies. The bedroom farces, the display of lingerie and the risque dialogue of the modern stage are the outward manifestations of this disease. And, when it comes to the movies, the playhouses throughout the land are simply reeking with it. Here, for example, is an up-to-date paragraph written by Benjamin B. Hampton, president of four film-producing companies, and one of the movie men who deplores the downward tendency in his own business. He says, writing in the *Pictorial Review* for February, 1921:

> "Compared with the conditions now, the old-time sex appeal (in Trilby, Zaza and Sam T. Jack's sex lure) is gentle as a bottle of milk. To put over a play simply filled with the sex appeal under the guise of uplift drama is the farthest point north in motion picture strategy, and therein lies the dangerous subtlety of present-day tendencies. Nearly all our leading sex appealers manufactured movies of clean domestic grade until competition forced them into sex stuff. Children everywhere are receiving more 'education' in crooks' methods and in other phases of manners and morals in a month than adult humans formerly received in a lifetime. A spoken play that might be presented to an audience of educated, experienced grown-ups without serious danger may become dangerous when shown in a motion picture house to school children and to young sweethearts sitting in the dark."

What are we going to do about it? If the old saying is true that "Eye Gate is the way to Child Soul," what sort of souls are being developed in the children of today by the things that are passing before their eyes in the movie houses and the theaters?

Ellis P. Oberholtzer, in a recent article in the *World's Work* magazine, said:

> "The producers of such films, as every one at all familiar with the facts knows full well, are not acting in the interest of any dramatic end. They select a theme and give it settings with the object, principally, of lining their own pockets without regard to the public welfare. A picture which is made to bear the name 'Tainted,' 'Hell Morgan's Girl,' 'The She Devil' (I know of two separate pictures of this name), 'Shackled Souls,' 'The Scarlet Woman,' 'The Mortal Sin,' 'The Courtezan,' 'The Libertine,' 'The Littlest Magdalene,' 'The Gutter Magdalene,' 'The Sin Woman,' by its very title appeals improperly for public support. Even when a film story is adapted from a well-known play, opera or book, it may be given a new name selected for commercial purposes. I have in mind 'La Gioconda,' which, when it was 'picturized,' became 'The Devil's Daughter'; 'La Tosca' made into 'The Song of Hate,' and 'The Jewels of the Madonna' which was offered us as 'Sin.' More recently Barrie's 'The Admirable Crichton' has been filmed as 'Male and Female,' Clyde Fitch's 'The Bachelor' is 'The Virtuous Vamp,' and a story founded on the play, 'DuBarry' is 'Passion.' The picture may be unobjectionable; it may, indeed, have positive value. The disheartening, really disquieting symptom, when we diagnose the case, is that those who are in close touch with our amusement business and follow it for gain feel that they must resort to such contemptible devices to attain success."

In other words, they are victims of sexitis, and they are spreading its germs far and near.

Yes, the stage is suffering from acute and chronic sexitis, and the noble dramatic art has just about been strangled in the house of its friends by these unwholesome and distressing conditions.

The extreme styles in women's dress are manifestations of sexitis. The exposure of the female form through modern styles has come to the point of positive indecency. Yet many good women allow themselves to be driven by the slave masters of style because of their desire to be considered "smart."

The true purpose of dress is utility and beauty, and it would be just as legitimate and just as logical for men to begin to dress with a view to sex appeal as it is for women so to do.

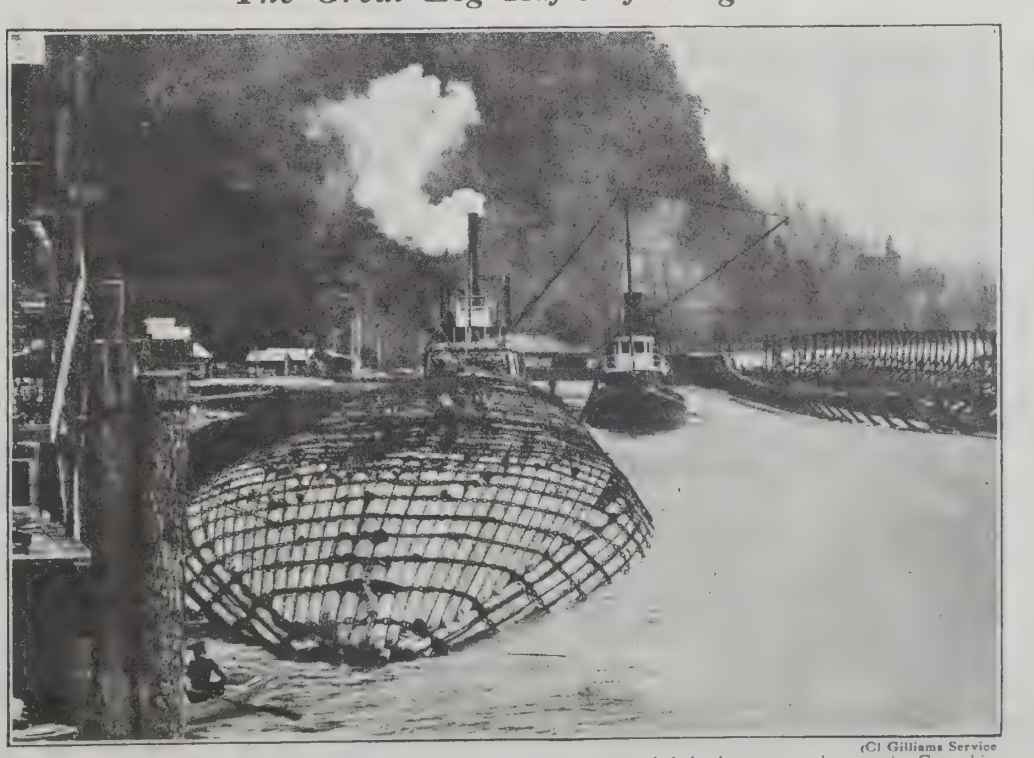
The modern dance also is a manifestation of this disease. These popular dances of today that have crept now even into the upper social circles, and, in some places, are being danced even in the churches, have come up from the underworld. They take their very names and movements from the lower animals, and they were originated in the slums of New York, Chicago, New Orleans, San Francisco, London, Paris and the degenerate cities of the Orient.

That thoughtful and talented Englishman, Harold Begbie, in his book, "The Crisis of Morals," exclaims: "Think what it means that these filthy and lascivious dances are tolerated in private houses, and that they are laughed at and caricatured in the newspapers as though they were merely an absurdity of fashion!"

It is encouraging, however, to note that even some secular papers are at last waking up to the real menace in these evils. The *Times-Picayune*, of New Orleans, in an editorial said:

> "The trouble with questionable dancing is that there is nothing questionable about it—it is unquestionably bad! There has been a gradual undermining of the sensitive feelings of a large element of the public, until today actions are tolerated and moralities accepted in connection with social functions which until recently, would have subjected those who gave them to instant ostracism. The characteristic, as we see it, of the present period of dance degradation is that it attacks most virulently the very young. *It is striking at our boys and girls, our young women and men, and thus at the very roots of our future society.*"

Even *Broadway Brevities*, the New York amusement magazine, gives unexpected support. The editor wrote me a personal letter thanking me for my fight on the dance, and in the course of an editorial in this magazine, he said of the dance:



> "Dr. Straton might have gone on to say that its licentious insipidities must, sooner or later, react on our civilization, and undermine and annihilate it. To get down to copper tacks—its mad devotees regard dancing principally as a medium for 'landing' chickens. Dancing, therefore, not only is a fraud but a social menace of the most frightful magnitude. *Brevities* is continually in receipt of complaints against the dancing halls, especially since Dr. Straton made his memorable visit. *We do not fear to state that in our opinion most of these places are notorious incubators of vice.* Young girls are in profusion among the patrons, often unaccompanied, and thereby exposed to the tender mercies of cubs to whom neither virtue nor pocketbooks are sacred. It is not our desire to pose as a moral censor, but some sympathy is certainly due to the mothers of these silly creatures."

The increasing number of divorces and the terrible fact of race suicide are also manifestations of this same malady—sexitis.

Sexitis is a serious disorder because it carries with it the shadow of racial degeneration and social decay. There has never been an age in the past where the conditions were more favorable for the development of a wrong relationship between the sexes than they are today. The shocking congestion in our great centers of population, the throwing of the sexes together helter skelter by commercialism, the stress of modern life, with its strain on the nervous resources and its consequent weakening of the powers of resistance, the curtailment of home life and the lack of adequate inculcation of ideals as a consequence, all these things are making for a breakdown of the barriers of safety, and they will plunge us into a moral quagmire within another generation unless these evils are corrected. Every great civilization of the past has decayed first and fastest precisely at this point.

These, therefore are no light matters with which we are dealing. The very life of the race is at stake in these tremendous issues, and instead of rebelling against rebuke and justifying ourselves in pride and haughtiness, we need to bow in the very dust of repentence and turn back, in humility to God and His truth. The sanctity of the marriage relationship, the integrity of the home, the proper rearing of childhood, the success of the church, and the health and very life of the race are all at stake in the menacing malady—sexitis!

The Great Log Rafts of Oregon

(C) Gilliams Service

These log rafts, known to the people of Oregon as the cigar rafts, on account of their shape, are unique to the Columbia River. Huge logs are bound together in a "cradle" by great chains and then launched by the river along which they are towed by powerful tugs to the Pacific ocean and down the California coast to the cities where the logs are cut into lumber. During the trip every precaution is taken to see that the raft does not break up nor come to harm. This is not remarkable when it is remembered that every raft when completed represents a large fortune in money. This photograph shows a raft starting on its voyage to the sea. To the right is the cradle from which it was launched.

BRIEFLY TOLD

Chauncey M. Depew deposited the first $100 he ever earned in the Peekskill Savings Bank, Peekskill, New York, at interest, more than 60 years ago. It has been there ever since and has multiplied to $800. The bank considers it as its star account because of its venerableness.

Autumn blossoms on several fruit trees near Omaha and Council Bluffs, Iowa, present a strange sight. The early spring frosts, with the drouth that followed, then excessive rain and hot weather, caused the fruit trees to blossom, it is believed.

A politeness contest has been organized by a Paris newspaper. Five thousand francs weekly for six weeks will be paid to the most polite persons in France. Chauffeurs and horse cab drivers, telephone operators, employes of the post office, railways and other transport services, department stores and policemen will be included in the category.

The first alligators ever found in Shanghai were brought out during the great heat of July and early August, according to authentic records.

Hand-woven cloth made from banana fiber in East Africa has been brought to Australia. There are several grades of this fiber, and it is believed that portions can be used in the manufacture of artificial silk. Experiments are being made to obtain cloth, rope, twine and paper from the banana by-products.

The hydroscope is a clever instrument by which the sea bottom can be examined with a clearness hitherto impossible. It is similar to a huge telescope, with a complex system of 12 lenses. A newspaper lying on the sea bottom at a depth of 360 feet from the surface can be read by means of the hydroscope by daylight.

A jack-tar, dressed as if he were living in Nelson's day, is placed at the door of the Royal United Service Museum, in Whitehall. He wears a blue jacket edged with white, a green striped shirt with a black silk tie, a shiny black hat, white stockings, and black buckled shoes.

Coated with barnacles and oysters and provided with an electrical firing device, a three-foot mine recently was washed ashore at Oceanview, Virginia. The mine bore the letters K-1.

Twenty million persons attend motion picture theaters daily, paying in the aggregate $4,000,000 each 24 hours.

The seven-year-old ban on the French language in Berlin has been broken. A Chicago opera star has received permission from the German Government to sing the rôle of Mephisto in French. The rest of the cast will sing in German.

A one-million volt electrical current has been transmitted over a wire, a triumph ending 30 years' experimenting by the General Electric Company.

One man in every 25 in the United States is a coal miner.

A fortified watermelon patch near Parker, South Dakota, is believed to be the only one of its kind in the United States. Armed guards patrol the patch, assisted in their work by a powerful searchlight, which has been installed on an elevation. The searchlight rays shoot in every direction continually throughout the night

The oldest harp in the world is preserved at the Louvre in Paris. It is nearly 4,000 years old and was found in an Egyptian tomb. Harpers were held in such high regard by the ancient Celtic races that they were treated with veneration, their persons being sacred and their lands being free.

The oldest university known to history is the White Deer Grotto University in Kiangsi province, China. It was founded in 960 A. D.

The largest ruby in the world, the great Moson Tarsca ruby, was carried around, in its rough state for nearly 20 years by a Hungarian laborer of Omaha as a lucky pocket piece. The Hungarian found the stone near a little stream in Hungary and brought it to this country in 1903. The stone weighs 23.9 carats and is valued at $125,000.

With the recklessness of a cowboy, Albert B. Fall, Secretary of the Interior, joined in with "cowpunchers" and assisted in stemming a buffalo stampede at the buffalo farm in Yellowstone Park. Only an expert horseman would attempt this, as stampeded buffaloes become blind with fright and fury and charge at anything.

Pigeons of the capitol park in Madison, Wisconsin, are doomed to extinction on orders of the superintendent of public property. It is costing the state hundreds of dollars to keep these birds and expert riflemen are posted in the capitol to exterminate them.

Natural resources of Spitzbergen in the frozen North are commanding attention. It is estimated there are nine billion tons of coal and much iron ore on the archipelago. It also has extensive deposits of zinc, copper, asbestos, gypsum, molybdenum, oil shale and possibilities of free oil.

Northern Scotland in early July has no dark nights. The track of the sun's passage from northwest to northeast is marked by a crimson glow above the horizon, which links the long summer days together in an unbroken chain. On the shores of the Moray Firth one can easily read a newspaper at midnight and play golf. The birds twitter and sing continually.

Walrus hunting for the ivory is depleting the large herds that formerly existed among the ice floes of the Arctic Ocean and in Bering Sea. The walrus is helpless against the high-powered rifles of the hunters and enormous numbers are slaughtered for their hides and tusks.

Of every 1,000 persons in the United States, 837 are white, 99 black, two and one-quarter red and one and three-quarters yellow, according to the latest figures compiled by the Census Bureau.

The most perfect Venus hitherto come to light has just been discovered in the Thermal, or Baths, of Cyrene, where extensive excavations are being carried on. The statue is perfectly preserved and is somewhat larger than life-size. It belongs to the Greco-Roman period and bears a strong resemblance to the Venus of the Capitol.

A singing motorman is winning the hearts of many car riders on a Seventh avenue surface line in New York City. He sings only the old songs in a clear, melodious tenor voice. He was once a member of a famous minstrel troupe and despite the many warnings of inspectors he continues to sing at his work.

Hull-less oats have been raised by the South Dakota Agricultural College after four years' work. The new oats this year yielded 30 bushels to the acre. The ordinary white oats with hulls yielded only 35 bushels to the acre. The new grain is exceptionally valuable for hog feed.

The bite of a cobra or deadly Russell viper of South America is no longer dangerous if the victim is vaccinated with the serum of the snake biting. Snakes are compelled to strike aseptic gauze depositing their poison there. The poison is diluted with sugar or milk and injected into a horse. More than 5,000 tubes of the vaccine have been distributed in South America.

A device which rings a bell if water is found in gas recently has been developed by the National Bureau of Standards.

Petaluma, California, is the egg city of the United States. A large plaster chicken stands at the railroad station and the chicken population is more than 6,000,000.

Beavers saved the pear crop in the Enitia district of the state of Washington. When the water for irrigation purposes became low and threatened to dry up, two beaver dams in the mountains were opened up and enough water released to save the entire crop. The dams were then repaired to save the lives of the little builders.

Fires have been burning continuously for more than 130 years near Fort Norman, not far south of the Arctic circle. They feed on great seams of lignite that have ignited spontaneously. Alexander Mackenzie, the explorer, reported them in 1789, and it is likely that they had been burning many years before he saw them.

Gold and silver alloyed copper spikes were found by wreckers of the old American frigate, Granite State, built in 1812, and burned at New York for the metals. The Granite State served in four wars, but no gun was ever fired from her deck at a hostile vessel, so far as is now known.

John G. Neihardt, Poet Laureate of Nebraska

By FRED L. HOLMES

THERE is only one poet laureate in the United States. This title that takes one back to the days of John Dryden, William Wordsworth and Alfred Tennyson, of England, has just been bestowed on John G. Neihardt by the Nebraska legislature. Not only is he the first man who has such an honor conferred on him by any state in the Union, but he is the only poet since the days of the Cambridge group to have one of his long epic poems dealing with American life published in a volume by itself for use in the schools. Two editions were exhausted in a single year.

Up to 1914, John G. Neihardt was an obscure poet, who made his home at Bancroft, Nebraska. For more than 20 years he had been making a study of the hardships of the early pioneers, the fur traders and the trappers who came into the plains region following the famous expedition of Lewis and Clark in 1804. These men he has immortalized in a poem, "The Song of Hugh Glass." Instant recognition came. Teachers demanded it for use in the schools. Then the Nebraska legislature, in the spring of 1921, caught the inspiration and passed the following joint resolution:

"Whereas, There is the closest connection between the growth of civilization and the developments of literature, and

"Whereas, wise commonwealths in all ages have recognized this relation by lifting the poet to the same plane as the statesman and military chieftain, and

"Whereas, John G. Neihardt, a citizen of Nebraska, has written a national epic wherein he has developed the mood of courage with which our pioneers explored and subdued our plains, and thus has inspired in Americans that love of the land and its heroes whereby great national traditions are built and perpetuated, and

"Whereas, our people wish to exalt such gifts of the human spirit, therefore be it

"Resolved and enacted, by the house of representatives, the senate concurring, that John G. Neihardt be, and hereby is declared poet laureate of Nebraska."

JOHN G. NEIHARDT

Laureate was the name first applied to poets who were honored by the gift of a laurel wreath. It is now a title of an official of the royal household of Great Britain and has been recognized there for more than 500 years. The ceremonies conferring the laureate honors on John G. Neihardt were held at Lincoln, Nebraska, June 18, 1921. They were conducted by the Nebraska University faculty, and the presentation was made by Dean L. A. Sherman.

"This is an auspicious day and date for Nebraska," said Dean Sherman. "No other state, it appears, has by legislative recognition, a poet laureate. No other state, we may fairly say, has such a reason. Nature has not shaped for us, in this paradise of prairie country, mountains that might become by myth of fancy the home of gods and muses. There is, there can be, no Olympus, no Parnassus here. But we have that which has given fame to all the sacred groves and mountains and fountains of spiritual history. We have the poet's informing vision, and shaping hand.

"The ceremonial that we assembled to witness is by no means a novel one. In the days when Parnassus was, in the youth time of the arts, sons of Apollo were crowned publicly with his laurel. And so at the close of the Middle Ages was Petrarch crowned at the capitol in Rome. Were our own great new capitol finished, it would have been fitting that the first poet laureate of Nebraska should have been honored at its portals."

Before the audience which came to witness these coronation ceremonies, came a slender man just 40, whose heavy hair and large head would mark him conspicuous in any audience. He was simple of address—simple as had been his life. The Poet Neihardt was born in an unplastered one-room structure on a rented farm near Sharpsburg, Illinois, January 8, 1881. Shortly after the birth of this son the family moved to Northwestern Kansas, where pioneer conditions prevailed and the family residence was a sod house. Five years later the family went to Kansas City, Missouri, and in 1892 to Wayne, Nebraska, where Neihardt was educated at the Nebraska Normal School. He was so poor that he earned his tuition by ringing the chapel bell hourly to announce the convening of classes.

Even in his youth there was a noticeable mysticism and melancholia in the nature of Neihardt. As a little boy he wanted to become an inventor and the back yard of the Kansas City home was strewn with cable line systems, tunnels and grades and turbine engines. When the boy was 10 years of age his father died and his mother supported herself and children by working for 50 or 75 cents a day. It was while living in Kansas City that the awe and pervading atmosphere of the West settled with all its subtle meaning into his nature. The Missouri River as it comes sweeping down through the plains at Kansas City touched him with a feeling of loneliness and insignificance, later to be portrayed in the poem, "The River and I."

"I remember well the first time I looked on my turbulent friend, who has since become as a brother to me," said Mr. Neihardt in explaining this hushed feeling and a sympathy inspired by the river. "It was from a bluff at Kansas City. I know I must have been a very little boy, for the terror I felt made me reach up to the saving forefinger of my father, lest this insane devil-thing before me should suddenly develop an unreasoning hunger for little boys.

"For the summer had smitten the distant mountains and the June floods ran. Far across the yellow swirl that spread out into the wooded bottomlands, we watched the demolition of a little town.

"Many a lazy Sunday stroll took us back to the river; and little by little the dread became less, and the wonder grew—and a little love crept in.

"If in a moment of despair I should reel for a breathing space away from the fight, with no heart for battle cries, and with only a desire to pray, I could do it in no better manner than to lift my arms above the river and cry out into the big spaces, 'You who somehow understand—behold this river! It expresses what is voiceless in me. It prays for me!'"

At 11 years of age Neihardt forgot his toys, his sailboat, his engines and machinery, and, following a dream, decided to become a poet. It was not unnatural, for his father had scribbled many unpublished lines.

"It was as if a voice called me from my mechanical inventions, saying: 'Come away. This is not the thing,'" explained Mr. Neihardt. "That was the first feeling which I had and it is this compelling influence which has guided my life since."

Shortly afterward Neihardt wrote the first of his verses, "The Stubble-Haired Boy." At once he began to collect a library of good books in cheap bindings. The first volume of poetry he owned was "Idylls of the King," obtained as a premium for soap wrappers. His first verses were published in the Cook County (Illinois) *News,* when he was nearly 14 years old. His first poem for which he received pay was printed by the *Youth's Companion.* It was written in 1900 in a potato patch with the back of his hoe for a desk and was called "The Song of the Hoe."

For nearly six years, 1901-7, Neihardt lived among the Omaha Indians, studying their character, history and legends. He had taught country school two years at Hoskins, Nebraska. When this desire came to know more about the world than the ordinary human sees, he spent his summer tramping through Kansas and Missouri and between the ages of 16 and 20 he engaged in the occupations of farm hand, hod carrier, office boy, marble polisher, stenographer and teacher.

Neihardt has always been poor. When he had finished the normal school he wanted to go to the state university, but was without funds. Carrying in one pocket a copy of Tennyson and in another Browning, he went back to work in the beet fields for 50 cents a day, and as he crawled on his hands and knees, weeding and thinning the beets, his brain was busy with the great dream. It was called "The Divine Enchantment," and was finished in 1900. As soon as the beets were harvested he began the composition of the poem and continued work on it for more than two years.

It was while as a boy living in a sod house in Northwestern Kansas that Neihardt conceived the greatness of the West, the compelling beauties of the prairie, the immensity and boundless sweep of its vast untrammeled acres. The Greek and Latin poems which had inspired him in his college course now awakened in him a desire to picture this western advance of civilization as an epic.

A SNAPSHOT OF MR. NEIHARDT

"The four decades during which the fur trade flourished west of the Mississippi River may be regarded as a typical heroic period, differing in no essential from the many other great heroic periods that have made glorious the story of the Aryan migration," said Mr. Neihardt in explaining how he conceived the idea of writing western epics. "The heroic spirit, as seen in historic poetry, we are told, is the outcome of a society cut loose from its roots, of a time of migration, of the shifting of populations. Such conditions are to be found during the time of the Spanish conquests of Central and South America; and they are to be found also in those wonderful years of our own West, when wandering bands of trappers were exploring the rivers and the mountains and the plains and the deserts from the British possessions to Mexico and from the Missouri to the Pacific.

"We lack the sense of racial continuity. For us it is almost as though the world began yesterday morning; and too much of our contemporary literature is based on that view. The affairs of antiquity seem to the generality of us to be as remote as the dimmest star, and as little related to our activities. But what we call the slow lapse of ages is really only the blinking of an eye. Sometimes this sense of the close unity of all time and all human experience has come on me so strongly that I have felt, for an intense moment, how just a little hurry on my part might get me there in time to hear Aeschylus training a chorus, or to see the wizard chisel still busy with the Parthenon frieze, or to hear Socrates telling his dreams to his judges. It is in some such mood that I approach that body of precious saga-stuff which I have called the Western American Epos; and I see it, not as a thing in itself, but rather as one phase of the whole race life from the beginning, indeed, the final link in that long chain of heroic periods stretching from the region of the Euphrates eastward into India and westward into our own Pacific Coast."

Out of this study of the advance of the pioneers, the establishment of trading posts, the rise and decline of the fur trade, the depredation of Indians, the founding of military camps, and the picture of the plains has come the epic poem, "The Song of Hugh Glass." It is the story of a pioneer trapper who enters the West and who in searching for food is caught by a grizzly and left prostrate on the plain. His friends discover him, but after two days of watching, the unconscious man was left alone to die. But Hugh Glass, a mountain of a man, the embodiment of sinew and brawn and adventure, revives, and crawls a hundred miles back to civilization, subsisting on berries and the fruits of brush and thicket the while.

Founded on historic facts, this poem is not a story of colorless and naked straight lines, but is a rich mosaic made up of a thousand historic incidents, pictures of shades and light, of waste changing every hour from dawn to midnight, the odorous ozone of rain-drenched land, the soughing of the winds in the cottonwoods, the nickering of horses in the corral, the disturbing voices of wild life, the blistering heat of summer, the blinding snow of the blizzard and the loneliness and solitude under the judgment of stars twinkling in the night.

Deserted by friends in the drear and waste of a land then desolate, Hugh's memory paints the picture of days at home, the twilight and evening:

It was the hour when cattle straggle home.
Across the clearing in a hush of sleep
They saunter, lowing; loiter belly-deep
Amid the lush grass by the meadow stream.
How like the sound of water in a dream
The intermittent tinkle of yon bell.
A windlass creaks contentment from a well;
And cool deeps gurgle as the bucket sinks.
Now blowing at the trough the plow team drinks;
The shaken harness rattles. Sleepy quails
Call far. The warm milk hisses in the pails
There in the dusky barn lot. Crickets cry.
One hears the horses munching at their oats.
The green grows black. A veil of slumber floats
Across the haunts of home-enamored men.

It is not alone the colorific portrayal of Hugh Glass which the Poet Neihardt would canvass, but it is the story of that body of adventurers, their characteristics and their aspirations, who from 1822 to 1829 opened a way of expansion of the nation beyond the Missouri found the southern pass through the mountains and the overland route to California, which thousands were to travel in a mad rush to the gold fields 20 years later. It is the story of westward expansion in America told in its relation to the whole race movement from the beginning. It is the humble achievements of ordinary men, not the official leaders.

"History as written in the past, has been too much a chronological record of official governmental acts, too little an intimate account of the lives of the people themselves," said Mr. Neihardt in explaining the basic inspiration back of this poem. "Doubtless, the democratic spirit that now seems to be sweeping the world will, if it continues to spread, revolutionize our whole conception of history, bringing us to realize that the glory of the race is not the glory of a chosen few, but that it radiates from the precious heroic stuff of common human lives. And that view, I am proud to say, is in keeping with our dearest national traditions.

"I dreamed of making those men live again for the young men and women of my country. The tremendous mood of heroism that was developed in our American West during that period is properly a part of your racial inheritance; and certainly no less important a part than the memory of ancient heroes. Indeed, it can be shown that these men—Kentuckians, Virginians, Pennsylvanians, Ohioans—were direct descendants, in the epic line, of all the heroes of our Aryan race that have been celebrated by the poets of the Past; descendants of Achilles and Hector; of Aeneas; of Roland; of Sigurd, and of the Knights of Arthur's Court. They went as torch bearers in the van of our westering civilization. Your Present is, in a great measure, a heritage from their Past."

(*Concluded on page 11*)

Our Floating White House

Top, left—President and Mrs. Harding and friends waving goodby from the deck of the Mayflower; right—Commander Balston L. Holmes, of the President's yacht, the Mayflower. Center, left—The Mayflower; right—Smoking room. Bottom, left—Dining room; right—Reception room.

NO PRESIDENT nor Mistress of the White House ever has had so much rest and pleasure out of week-end yatching as the Hardings. Scarcely a week goes by that they do not embark on the beautiful government-owned boat, the Mayflower, known everywhere as the President's yacht, and cruise down the historic Potomac into Chesapeake Bay, visiting here or there as fancy dictates.

There's nothing selfish nor exclusive about these Mayflower trips. Neither the President nor Mrs. Harding are the sort of people who like to herd by themselves in lonesome aloofness. Being real, genuine, whole-souled human beings, they thoroughly enjoy the good old-fashioned art of being neighborly and sociable as practiced in typical small American towns where everybody knows each other by his first name. In this delightful respect the Hardings haven't changed the least bit since leaving the little town of Marion, Ohio. The elevation to the position of chief executive, and America's first lady, has not, in the leastwise, turned the heads of Mr. and Mrs. Harding. They never dream of starting out on a yachting trip without inviting as many friends to be their guests as the boat will comfortably accommodate.

The frequent use of the Mayflower during the past spring and summer has given it unusual prominence in the press of the country, arousing the curiosity of the public as to the history, general appearance and details of the noted craft.

The Mayflower, originally, was the property of Ogden Goelet, a New York business man of great wealth. It was constructed for him at Clydebank, Scotland, in 1896. Two years later, at the breaking out of the Spanish-American War, the United States Government purchased it from the Goelet estate for $430,000. During the exciting days of our little scrap with Spain, the Mayflower, in command of Captain M. R. S. Mackenzie, was one of the busiest vessels connected with the American Navy.

It was during the days of the Roosevelt régime that the Mayflower was converted into a pleasure yacht for the exclusive use of the President of the United States.

The boat is of fair size, the water line being 275 feet, the breadth 36 feet, and draft 17 feet 4 inches. Her water displacement is 2,690 tons. She makes an average speed of 14.2 knots an hour. It requires a large crew of officers and men to keep the Mayflower in readiness for sailing at any hour of the day or night. It is always spick and span in appearance, the decks and every nook and corner being as clean and shiny as a bride's kitchen or a nurse's collar. Many a present-day wife could get some valuable housekeeping pointers in the way of neatness and cleanliness from the sailor methods aboard the Mayflower. It is quite evident that there is never any stinginess in the use of soap, water, scrub-brushes, brooms and elbow grease.

The reception room is as cozy and comfortable as any to be found in a private home. There is an abundance of big cushiony chairs and couches. For the musically inclined there is a beautiful piano and a victrola. It is quite evident, however, that the Hardings and their friends have little or no patience with the jazz junk with which the world is so sorely afflicted. On a little table near the piano are half a dozen hymn books and a large volume of old-fashioned songs, such as "Silver Threads Among the Gold," "The Old Oaken Bucket," "Dixie," "Swanee River," "Annie Laurie," "Good Bye My Lover, Good Bye," "My Old Kentucky Home," and "Home, Sweet Home." Both the hymnals and the popular song volume look very much the worse for wear, clearly indicating that many a happy afternoon and evening have been spent in the reception room.

Just one glance at the dining room is enough to make anyone feel as though he had been mealless for a week or more. It is, by all odds, the most fascinating part of the boat. This room extends the full width of the yacht and is as richly furnished as the best hotel in the land. The smoking room is as comfortable and palatial as the ones to be found on popular ocean liners.

Taking it all in all, the Mayflower makes it possible for the President to have a floating White House that is virtually as comfortable in its appointments as the celebrated mansion in Washington.

The man who is responsible for keeping the Mayflower in deep water and away from jutting rocks or shoals is Commander Balston L. Holmes, of the United States Navy. Commander Holmes saw much active service during the World War.

Let Us Have Peace!

IT MAY be that Senator Borah is right in declaring that the Treaty of Versailles without the League of Nations is "a militaristic document." Senator Williams may not be far from accurate in his characterization of the new treaties as "an ignominious and inglorious postscript to American war history." But all this is crying over spilt milk.

Congress and the country face pressing tasks in connection with the economic rehabilitation of America and the world. The people are a thousand times more concerned at this time with the tremendously vital issues to be decided in the immediate future by the Disarmament Conference, than with party politics or the revision of history.

Let us honor the fallen, succor the needy, cheer the brave—but for heaven's sake let us get on!

A Costly Port for Business

THE movement for a lakes-to-ocean waterway via the St. Lawrence River should be helped by recent revelations as to the use New York makes of her virtual monopoly as a seaport. In the Meyer committee hearings, it has been brought out that profiteering and graft implicating both city officials and steamship companies have been practiced on a colossal scale in the matter of pier leases. Over and over it is shown that Tammany officials have been enriched through connection with firms favored in the original letting of the piers that they might sublease them at an advance of 100 per cent or more.

That New York is a very costly port to do business in has long been known to shippers and that plain "graft" has had much to do with this costliness has been more than suspected. But even to taxpayers hardened to exposures of this sort the recent testimony in regard to the cost of policing the piers given by Major George W. Knight, formerly in charge of Army Traffic Service in New York, caused a rude shock of utter amazement. He testified that the cost of pier policing alone was $30,660,000 in 1917; $33,850,000 in 1918; $41,610,000 in 1919; $35,850,000 in 1920. This year, he said, basing his estimate on the number of men employed and the prevailing wage, it will be a little less, but only "on account of the slump in tonnage."

The municipal police department budget allowance this year is $28,349,407, so it has cost the Federal Government and private interests much more to guard the piers than it does to police the entire city. War emergencies may account for some of this stupendous expenditure, but the burden was actually increased after the armistice. And this burden, of course, is imposed on New York commerce, and the country's commerce passing through that sea-gate, on top of the actual and very considerable loss from thefts and fires, as well as the scandalous profiteering in pier leases.

One curiously illuminating item in this policing cost is, despite the fact that dodging and circumventing the desperate and cunning New York wharf rat is rather a man-sized job for its danger, difficulty and exposure, many veterans of the city police department, pensioned for age and disability, are engaged in it, drawing half-pay from the city and whole-pay from private employers!

The Bombed Battleships

IT IS going to be hard to convince people who have no interest in steel production or armament manufacture or in perpetuating the provocation to war (and naval or military promotions) which big navies really constitute, that the day of the dreadnought has not ended in view of the sinking of the battleship Alabama in the bombing tests off Tangier Island. Aviation enthusiasts declare that their most hopeful predictions have been confirmed, pointing out this latest demonstration of the deadliness of the airplane as a weapon of attack.

The flying men, despite the limited means at their disposal, have practically proved to a certainty that they can sink any warship afloat. In fact, the conclusion is now inevitable that the heaviest armor-clad vessel is at the airman's mercy when he rains high explosives upon it.

In the case of the sinking of the Osfriesland, it will be remembered that the naval experts tried to throw cold water on the value of the experiments made off Hampton Roads. They protested that the bombing airplanes were favored by conditions wholly unlike those prevailing in war time, when a battleship might do some shooting on its own account. There may be some reason in this; but it can no longer be denied that armor-clads are extremely vulnerable to overhead attack.

Within the last few months, boys who had never before tried to sink naval vessels, and working against the mossbacks, succeeded in sinking every sort of craft at which they had a chance. Our new superdreadnoughts cost $40,000,000 each and the airship that sunk the Osfriesland cost $23,000. The bigger the battleship the easier it is for an airplane to sink her. We could build 1,800 airplanes for what the Massachusetts will cost. In war, perhaps ten of these airplanes and 20 men would be lost in sinking a battleship with probably 2,000 men—a battleship that took three years to build sunk in a few minutes.

What use is a battleship, anyhow? This is one big question that the Disarmament Conference will have to take into account.

Miracles Do Happen

MORE than ordinary food for cogitation is offered by the marvelous recovery of the Rev. Dr. Daniel A. Poling, associate president of the United Christian Endeavor Societies of the World, whose back was broken in an automobile accident near Worcester, Massachusetts, some three months ago. He is now able to walk about and on the road to complete recovery, although at the time of the smash in which he was hurt it was at first thought that he had been killed and later that his injuries would cripple him permanently.

More than that, it is related, on the authority of eyewitnesses, that he was virtually called back from death to life by his wife who, despite the protests of bystanders, flung herself beside what seemed the lifeless corpse of her husband and for 15 minutes kept calling on him to come back, bending her entire thought to the work of reviving him, until at last she was rewarded by the fluttering shut of the opened eyelids and the sighing of the unconscious man.

"The hair on the back of my hand is miracle enough for me," said Walt Whitman, "and a mouse is miracle enough to stagger quintillions of infidels." It is all very well for the cynical and sophisticated to insist that miracles are impossible; but facts speak louder than opinions. Despite his compulsory recantation, Galileo could declare that the world did move.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1921. State of Michigan, County of Wayne, ss.

Before me, a Notary Public, in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:
Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, W. J. Cameron, Dearborn, Michigan; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding more than one per cent of the stock are:
The Ford Motor Company of Delaware, Henry Ford, Dearborn, Michigan; C. J. Ford, Dearborn, Michigan; E. B. Ford, Dearborn, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 30th day of September, 1921.

[SEAL] J. EMMET HALL,
(My Commission expires September 29, 1924.)

"It Must Succeed!"

THIS, according to H. Wickham Steed, editor of the London *Times* and Lord Northcliffe's right hand man, is the slogan that the powerful Northcliffe press has adopted in regard to the Disarmament Conference. In a *World* interview, Mr. Steed went on to say that the calling of the conference is "the most important initiative ever taken by any government in the history of mankind." This is one reason why it must succeed. The American and British peoples must make it succeed because "it is so vital to humanity the world over that its failure would mean world disaster."

As to how the English speaking peoples shall score the tremendous victory for humanity which an agreement for the limitation of armaments would mean, Mr. Steed is luminously specific. Quoting a speech by Lord Northcliffe at Vancouver in which he said, "We must disarm our minds before we can reduce our fleets," the great British editor declared: "If the British and the American delegates approach the conference with a sense of concordant good will, without prejudice or prepossessions, taking care to know all the facts, ready to consider them dispassionately and ready to give each other the benefit of any doubt that may arise, it will succeed."

Voicing the belief that President Harding and Secretary Hughes are already animated by this essential spirit and that delegates from other nations must respond to the influence of the favorable position in which it places the United States, Mr. Steed voiced the tremendously encouraging impression gathered in the course of his American tour that "even in quarters which consider themselves anti-British" in California, in the West and Middle West, as well as in the East, "there is a keen intuitive feeling that if the conference succeeds it will be because the representatives of the English-speaking peoples trust and support each other from the beginning to the end." In England, the masses of the people, he affirmed, are animated by the same feeling.

That this broadmindedness shall be expanded and emphasized on both sides of the Atlantic is therefore of the utmost importance.

New Use for Poets

THE University of Michigan is this year offering a novel attraction to its students. They will enjoy the advantages of personal contact with a real live poet. President Burton "believing that university students should get something immeasurably greater and more valuable out of a college course than all that textbooks and lectures offer," has arranged to have Robert Frost, the New England "poet of the common life," accept a fellowship in poetry with a salary of $5,000.

The arrangement is an ideal one for Frost. He will not have to conduct any lectures or classes; just living in Ann Arbor according to his own fancy in perfect freedom and shedding upon the students, so to speak, the light of his countenance and the inspiration of his splendid personality. He will not even have to fulfill an equivalent of the English poet laureate's function of celebrating academic glories and traditions on occasion. In President Burton's own words: "the poet will simply be a lovable human being, unhampered and unharrassed." And the popular "Prexy" foresees "how this freedom from worry and routine duties will tend to inspire him to do his greatest work." That was also probably the idea of giving the laureate a butt of malmsey.

We live in a utilitarian age. The utilization as by-products of what used to be considered waste is one of its marked features. An old-fashioned notion regarded the poet as fulfilling his chief end in life when he wrote poetry; but hereafter all the sweetness and light, the grace and beauty generated in the process will not be left to be distilled out of his writings by chance readers or partial critics contemporary or posthumous. It will fall on freshman and sophomore, junior and senior, alike, as he mingles with the boys and the co-eds while they meander in academic shades. New luster will be taken on by gridiron and baseball diamond. Lyric grace will deck the campus and "exams" will take on true epic qualities.

We remember, of course, that both Longfellow and Lowell did much of their best work while acquitting themselves of the duties of Harvard professorships. What a fine thing it would have been for Robert Burns if this new sort of fellowship had been his at Edinburgh! Yet there is the awful example of Thomas Bailey Aldrich who, in mid-career, was freed by the bequest of an admirer from any care about pleasing publishers or public—and who wrote never another line worthy of his genius! Still the experiment is one that will be watched with interest.

Mr. Ford's Page

THE human race is not a brotherhood as yet. It may become so at some future time, but it is not so now. For one thing, there is no sentiment of brotherhood throughout the world. For another thing, there is a very strong and well-established sentiment of stranger-hood, which education, civilization, contact and understanding have been powerless to diminish.

We so commonly accept as possible facts, the things that we wish to be true, that it was once our habit to say that if the peoples of the world only understood each other, the reign of perfect amity would arrive. But there is no lack of suggestion that, in some cases, the better some of the peoples understand each other, the more they dislike each other.

It is not so very different in individual matters: we accept the majority of people because we do not know them; the majority of those we avoid are the ones whom we know.

If it be true that there are in the world two or more opposite and antagonistic elements which can never be reconciled without doing violence to the very nature of things, then it follows that until the superior element arrives at mastery and the inferior element is disposed of, such a thing as unity is not to be thought of.

Our present times are times of break-up. Many people stand aghast at the opening seams which appear throughout society. There are rips and fissures where apparently all was cemented into a solid whole. "What does it all mean?" the people cry in their anxiety. It simply means that where we thought there was unity, there was no unity at all—it was all veneer; society has been "kidding" itself into believing that it could ignore the profounder principles and secure a superficial sort of unity by the process of back-slapping and glad-handing and general meaningless chatter about human unity.

A suspicion of this is always with mankind. "Let sleeping dogs lie," is a common proverb, but it does not describe a secure state of things. If security depends upon our keeping certain dogs asleep, then it is not security. For sleeping dogs will wake, and then security will be gone. If dogs awake are dangerous, the only possible security is in taming them so that asleep or awake they may be friendly, else remove them from any possibility of doing harm.

Anyway, no matter what may appeal to us in the form of theory, the fact is present and indisputable, that there is in the world a new consciousness of differences between groups, and that this consciousness is most felt and is most manifested in countries which most profess democracy. It is a popular manifestation, that is, it appears among the people, growing up out of them, not imposed upon them from above or from without.

It must be very clear to anyone who thinks about it that the present situation could not have arisen if the previous situation had been what we supposed it to be. That is, if everything had been as lovely as we supposed it to be, if the "sleeping dogs" were really not dangerous, then what has happened within the last year could not have occurred. There were sores left unhealed, there were differences left unsettled, there were rival claims left undecided. And there never will be peace until the sores are healed and until the differences are settled and until the rival claims are finally and rightly adjudged.

Now, what does this mean, practically? It means this: there will be division and strife until the naturally and eternally superior thing is acknowledged in its superiority.

"The survival of the fittest" is more than a term of science, it is more than a statement reeking with the sense of universal struggle, it is the declaration of the method of history and the objective of destiny—only the fit does survive.

The main difference in human thinking arises with reference to what constitutes the fitness of the fit. One side says that might makes right, and the other side says that right makes might. One side says that the brute will reign, the other side says that the angel will reign. To common sight it looks as if power would win, and money, and influence, and force, and majorities. That is the way flesh-minded men figure it. But faith-minded men see it differently and more truly. They see that there is an essential element of superiority without which money, majorities, force, influence and prestige are failures already. The flesh-minded men are always saying that the swiftest wins the race and the strongest wins the battle. But history is sufficiently long for us to confirm the truthfulness of the faith-minded man's declaration that "the race is not to the swift, nor the battle to the strong."

But we must not be misled by this term "the survival of the fittest" into the delusion that the fit survives by struggle. Not so. If there is a "struggle for life" it is on the part of those elements which are already passing away; they struggle to retain their place. The superior elements of life do not have to struggle to maintain their place nor to retain their superiority. Not at all; their whole strength is to be what they are; "he that believeth shall not make haste;" struggle belongs to the defeated.

All of which has a side light on tolerance. Some people do not like the word. Nevertheless it stands for a real elemental fact in our civilization. Tolerance is possible only to the superior; the lower elements are always intolerant. The nearer right a man is, the more tolerant he is; his tolerance is in ratio to his immersion in error. Good grows and multiplies of itself and crowds wrong to the corners; it is wrong that struggles and fights; the good does not have to.

What is occurring in the world today is this: under a false notion that vital differences could be patched up by a specious attempt at "good fellowship," the world has gone along for many years trying to pretend that nothing mattered much so long as nothing interfered with our fun or our pursuit of money. It has been mostly pretense, a rosy cloud of words without meaning.

Well, reality has overtaken us again, as it always will. There are strains of blood that will not mix, there are great group ideas and ideals that will never agree, there are great contrary claims that will never be reconciled. We have been pretending that it doesn't matter, but life is teaching us that it does matter; the differences are rolled back upon the consciousness of humanity once more, to be dealt with more wisely than we dealt with it during the miscalled "era of good feeling," which was only an era of camouflage.

A great deal of mushy sentimentalism has gone by the board. Some people, mistaking the matter, say that it is "idealism" that has disappeared. No, only sentimentalism. Sentimentalism is mushy, and soft, and polite, and likes a nice book in a cozy corner. Idealism is willing to fight, and be unpopular, and rouse nasty language and get its head cracked, if need be, for the honor of an idea.

In the meantime, let every man be true to his own position, if he is honestly convinced it is the true one. And let us give room and liberty for everyone to profess his own loyalty. The world is breaking up into its component parts. Every man must line up with the group to which his inmost soul gives its vote. It is a time of taking sides, and a man must take his own side. Afterward, when once again the position is made clear, we may find a better plan of working and living together in spite of our differences, and yet without denying them.

THERE is not less unity in the world; there is only the discovery that what we called unity was mere pretense. We pretended that certain differences did not matter; we are learning that they do matter. We were trying to bring in brotherhood by putting out loyalty to principle; we have found it would not work. There are deep and irreconcilable differences which will never be healed until the inferior disappears in favor of the superior. Society is now going back to its component groups; men are lining up with their own side; and when we get our various positions clearly defined, we shall be better able to work and live together. But it is not Unity, it is only camouflage that is disappearing now.

Is There a Shortage of Ministers in America?

The Other Side of the Widely Discussed Question

By a Practical Minister Who Is Working at It

THE recent announcement by one of our widely circulated reviews (*Literary Digest*, July 16, Page 30) that *"Ten thousand Protestant pulpits are expected to be vacant next year because of the lack of students for the ministry, as displayed by records of attendance at theological seminaries,"* is startling to church people who are satisfied with mere headlines for final authority.

Before entering into the discussion, and giving some facts as they really are, it is well to remember:

(1) That church news is the most incorrectly reported news in America. It is always big news in every way and too many reporters are like the blind men who went to visit the elephant and each brought back his own version of what an elephant was like. All denominations suffer greatly from badly reported news by those who are too busy to get all the facts, or who try to interpret the report through terms of their own denomination. Even among the leaders in the denominations we still find men who at times are not unlike Elijah under the juniper tree.

Jesus Chose Workingmen

(2) In this particular case the secular journals were partly excusable, for they got their information from statistics of theological seminaries which are specially set aside for training of ministers. For the comfort and consolation of the learned professors in theological schools, I refer them to their own historical departments to find that theological schools have never been a reliable thermometer or barometer of religious conditions or growth. What the theological schools have really revealed is that they are failing to get the students, and instead of suspecting the students are at fault, they might well look to their own work. They should at least remember that God raised up judges in Israel from unexpected quarters; Jesus did not select his disciples from either the schools of the Pharisees or Sadducees, but plain everyday workingmen, and many of our foremost bishops and leaders in all churches never completed a theological course in a high-grade seminary.

(3) Five years ago, after visiting several theological schools, I wrote an article published in one of the leading magazines, "Do Our Theological Seminaries Meet Modern Needs?" I found seminaries unpopular with many men even attending them. The complaints I heard were such as indicated restlessness among the students, and chafing under old rules and standards and regulations. They were splendid places to polish fossils, but not suitable places to awaken and inspire red-blooded men who had to meet real conditions as they are in real life today in the ministry. The schools were a generation behind their times, as many students looked at it, and men are going into the ministry direct from colleges and secular universities without three additional years at a theological school. Statistics will show that in the largest Protestant denomination in America—the Methodist Episcopal—more than 75 per cent of the ministers go directly into the ministry without entering a theological school. I am disposed to believe that similar conditions exist in the next largest Protestant denomination—the Baptists.

Many Never Graduated

SINCE the Methodist Episcopal church began work in the United States it has elected and ordained 93 men to the high office of bishop. Foremost among these were men who were schooled for law, like Bishop Emory and others, or medicine or educational work. Probably half of them never graduated from a seminary. I need not add that our foremost evangelists, like Mr. Moody and Mr. Sunday, never graduated from a theological school. I would not call attention to these facts except that constantly in almost every alarm sent out about a shortage of ministers, theological schools are taken as barometers and thermometers of religious conditions. Understand me, a close student myself, I believe in theological schools, although they did not do God's work and were no criterions in the days of Jesus, Martin Luther, John Wesley or D. L. Moody.

The real test of preacher shortage is the work needed and men to do it. Times change. Methods of work change. Amount of work required changes with generations. God does not need nor call men like so many fossils to fill places others have filled when the work others did is finished.

Church work, like all other work, is in a period of readjustment. Where the minister was the sole religious worker in the days of our grandfathers, we have today a Young Men's Christian Association with several workers in almost every town. A single denomination has nearly 500,000 trained Sunday school teachers and workers, giving each scholar as many minutes of religious instruction a week as the old-fashioned preacher once gave in a month to the entire congregation. Almost every newspaper carries as much religious news and sermon matter in some form as a minister once carried in a single church service.

The automobile and improved roads have made it possible for one minister to do as much in many places as two ministers could do 10 years ago. As it has made possible the consolidation of schools, so it has done with churches. Quite a few small struggling churches which never did more than maintain an existence have consolidated, or closed their churches entirely, and the congregation now goes to the town church to the profit of all concerned. A still larger number will do this within the next decade.

The automobile has made it possible for one minister to serve several weak country churches formerly requiring several ministers. The growing intelligence of the congregations themselves helps to this. Almost any congregation has several college graduates and school teachers and persons who can hold a prayer meeting, to the profit of themselves and others.

In still other cases where four preachers have been quartered in a town of 300 persons to gratify denominational pride, or the contrariness of local church officials, some of the preachers are having religious sense and judgment enough to go elsewhere, to fields which need them more. Much of the constant cry about vacant pulpits might be spent on churches which should never have been built, or which have served their day. Almost every little country town in America 50 years old has one or more such churches. Except where they are preserved for historic associations or social use, liquidation should take place at once and we should charge them off the ledger.

Present-day economics and business will not much longer run churches for the sake of running. They must show profit for God and His Kingdom or get out of the way. The church is God's Factory, its members are the workmen and the preacher is the foreman. Each factory must show profit for God or close its doors. The church as a whole is rising to this conception and individual congregations must do so. The Protestant churches of America have done more for world salvation in the last three years than in 10 previous years, shortage or no shortage of ministers. Religious leaders of every denomination concede this.

This directs attention to the fact of efficiency of the average preacher and that it is far greater than a decade ago. That is, he is turning out more goods whatever may be his preaching ability.

The reported causes offered for the shortage surprise me more than the alleged shortage of ministers. I have preached for 20 years and in the last decade have tried to keep close contact with church conditions in the East. Five years ago I took a whole year to study them in New York, Boston, Philadelphia, Baltimore, Washington and smaller cities. In 1919 I took a trip through Pittsburgh, Cleveland, Toledo, Detroit, Chicago and other western towns and cities. I have personally known more than 300 ministers since I began preaching 20 years ago. With this knowledge I confess nothing but surprise when some editors are constantly assigning starvation pay as the cause of few recruits. To this they add old age, poverty, hard times for family, and lack of social prestige.

Not After Big Pay

IN ALL my life I have never known a recruit who entered the ministry for big pay or was kept out of it by poor pay. Not a single case have I met. It is more a matter of consecration than compensation. Big consecration forgets compensation. No compensation can draw a man to the ministry if he has no consecration. Many men have had to abandon the ministry after entering it to support or educate large families, but this did not affect new recruits of consecrated young men.

It is almost a safe guess that 90 out of every 100 Methodist or Baptist ministers who started to preach 10 years ago or more, did so on less salary than $500 a year. Many of them have since become bishops and church leaders. The kingdom of Christ first, and the Kingdom will support every worker who is worth it if he is really needed.

Moreover, the quality of preachers is more important than the number. Quality is determined almost entirely by consecration and common sense. Eleven disciples—not one of them a graduate of a theological seminary of their day—started out after the elimination of the traitor among them, and the death of their Lord, and they changed world conditions in government, living conditions and religious life, because eleven of them were willing to die for their faith and consecration to Him "who had not where to lay His head." Nor do I read that our Lord promised them anything except a chance to work for Him and His Kingdom.

But where is the poor pay? A minister myself, I have never served a congregation in my life which did not give me a better home, better food, better clothing, better opportunity for self-expression, better social prestige than was enjoyed by one-half of the congregation that gave it to me. Lest I may be an exception I challenge all the editors in America to show me a preacher in good standing of any standard denomination who does not have a better home, better food, better clothing, better social surroundings than one-half of the congregation he serves. Is not that more than their Lord had? Then why the cry? What more should a follower of Him "who had not where to lay His head" expect? Moreover, the experience I have quoted above is the experience of every preacher to whom I have put the question.

True enough, some preachers do not become millionaires. Neither do some of their flock. The fact is, I have buried a few lawyers, doctors and business men who did not leave enough money to pay their debts, which causes me to add that ministers should create no debts but live on what they get if they have to wear overalls and work with their hands at times as did Paul—a thing that few of us have to do.

There are some real obstacles to obtaining recruits for the ministry. Among them I have found the following:

1. Growing autocracy of government in church work in all denominations.
2. Growing helplessness of the minister who is becoming a cog in church machinery.
3. Educational requirements some cannot meet.
4. Ecclesiastical politics and politicians.
5. Favoritism in denominations, which claim to be free of ecclesiastical politicians.
6. Unsatisfactory lives of men higher up.
7. Selfish ambitions among men, where they are not expected.
8. Constant money hunting required of ministers.
9. Money drives, which, I am persuaded, caused many efficient ministers to retire from the active work because they were unable or unwilling to stand the pressure.

While the above list is long, it probably is no greater than at any other time in the history of the church. Human nature is human nature everywhere and in all times.

Minister Growing Helpless

THE growing helplessness of the minister because of the growing autocracy above him which he dare not displease, and the same in his congregation which he must consider lest he be ground between, the upper and under millstone, is quite serious to men who have been in the work, but not considered by those who are entering it. The chief damage it does to recruiting ministers is when it cools the enthusiasm of the old preacher acting as enlistment officer.

However, the tide is turning. There can be no denomination without the preacher in the pulpit. There can be no bishops, church boards, church offerings, church drives without him; and he has it in his power to correct every evil named above. The pendulum seems ready to swing the other way and it may restore the preacher in the pulpit to his former power and glory.

But why argue the case of "preacher shortage" before the facts and evidence are submitted? Simply because so much has been said by so many editors about it from the standpoint of theological seminaries, past pay and other false viewpoints. In addition, readjustment in church work and church conditions may make an apparent decrease within the next generation. However, that time is not yet. Let us look at the facts and figures and evidence as given by statistical authorities in all standard works.

In spite of the fact, that fewer ministers are needed to do the same work as in former times;

That church membership is constantly growing;

That slavery and saloons have both been abolished;

That religious knowledge is disseminated through newspapers, graphophones, summer schools, and books as never before; let us see if 10,000 pulpits will be vacant next year or the year after.

Statistics show the following conditions in America for 30 years:

	1890	1900	1910	1919
Total number of ministers..	111,036	143,201	170,153	193,769
Total communicants	20,618,307	27,383,804	35,332,776	41,491,989
Total number population	62,947,307	75,994,575	91,972,266	(1920) 105,683,108

In 29 years the church communicants have more than doubled.

In 29 years ministers have nearly doubled.

In 29 years the population far from it.

Where we had one minister for every 560 persons in the United States in 1890 we now have one for every 528 of the population.

Denies There Is a Shortage

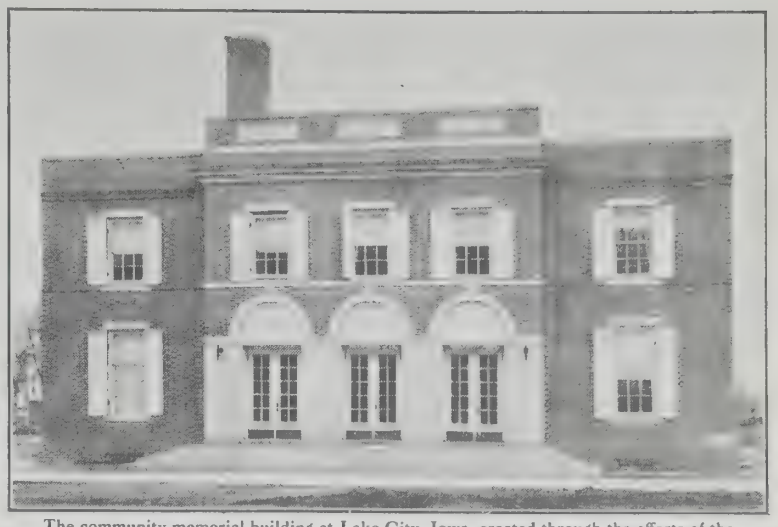
THE average church membership for each minister has increased from 185 members to 205.

The ministerial efficiency per minister has more than doubled in 30 years.

Nearly $500,000 has been raised for world salvation in the last three years. All this has been done in World War conditions which took 4,000,000 young men from home and home churches and left more than 50,000 dead in France.

All this has been done in spite of the fact that thousands of ministers were taken out of pulpits to serve as chaplains and in Y. M. C. A. work in the army.

All this has been done in spite of the fact that in former wars in our history there were terrible losses for the churches.



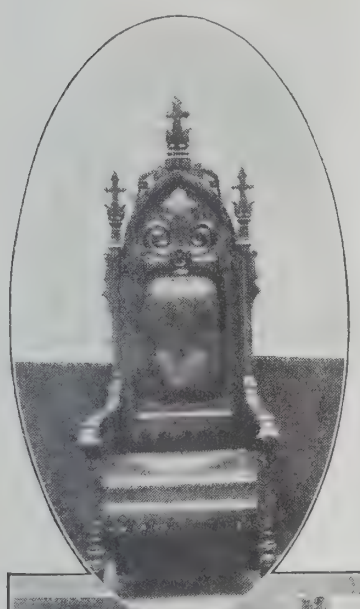
But is there a real shortage of ministers in any part of the country which did not exist before? I challenge any editor in the United States to find a community of 200 persons which has been settled permanently for two years and is five miles from a minister of some kind. There probably are such, but also there are consecrated men who would like to serve them.

In the days of President Roosevelt he was reported to have said that he could address a letter to "The Methodist Minister" at any post office in the United States and some Methodist minister would reply. And there are good Baptist, Presbyterian, Congregational and Lutheran ministers and ministers of all kinds in addition to Methodist ministers.

Civic Dream Comes True

What a Unique Women's Society Has Done for a Small Iowa Town

By R. P. CRAWFORD



The community memorial building at Lake City, Iowa, erected through the efforts of the Lake City Civic Improvement Society, a women's organization, as a crowning achievment to many civic improvements.

FOR a long time the town of Lake City, Iowa, had dreamed of a memorial that would fittingly commemorate the services of its soldiers and sailors, but it remained for the women of the town to engineer the project that resulted in the erection of one of the finest community buildings, not only in the Middle West, but perhaps in any town of the size in the country. This building is unique, for it fills the needs of the small town in a remarkable way, from affording the council a place to meet, to furnishing an auditorium and hall for social events. There are a women's rest room, handsomely furnished, a room for the American Legion, shower baths and gymnasium equipment. It is a theater, town hall, women's club, gymnasium, banquet hall, young people's club—all in one. There is nothing that concerns the community as a whole that does not have its center here.

But along with the story of this building goes the story of the Lake City Civic Improvement Society. A men's organization? Not a bit of it. There are nearly 250 members of this society from the town and surrounding country, and the strange part of it is, they are all women. One must remember, too, that Lake City is a town of only about 2,500 population. This society is not a study club nor a federated women's club. It is just what its name implies, an organization which spends all its time and efforts on improving the community. It is very democratic. An effort is made to enlist every woman in the town, and the woman from the country is welcomed just as much as the woman from the town. Its dues are only 50 cents a year.

Not long ago I sat in the home of Mrs. W. H. T. Shade, wife of the editor of the Lake City *News*, and heard her tell some of the inner secrets of this society, which grew to its present membership from 40 or 50 women who were the charter members.

"You don't need to have me tell you that every small town has certain things that need to be done," said Mrs. Shade. "The men are good workers, once they get started, but they always have their business worries and cares. You see," explained Mrs. Shade with a smile, "sometimes a man dislikes to say anything about a needed improvement to another business man, because he feels that his attitude may be considered as a critical one, and provoke a little resentment. But we women can go ahead and do things, and not be criticized, or when we are, it doesn't matter anyway."

I had been assured beforehand that the Lake City Civic Improvement Society was the peppiest organization in town, and when I began to learn some of its accomplishments, I agreed that such a characterization was true. The first thing the women discovered was that the town park had never been kept up. Of course, that was not much of a discovery, since every one knew that anyway. Perhaps it should be said more properly that the women discovered here an opportunity and an outlet for their club's efforts.

The first thing for the women to tackle was the hitching post proposition. Around the edges of the park were numerous hitching posts, almost gnawed into kindling wood, relics of the day when everybody came to town with horse and buggy. Six years ago there were still a great many who drove in with a team and a number of direful things were threatened the town if the posts were touched. But by working through the town council, the posts were finally removed and relegated to the side streets. The dire threat from a few farmers to boycott the town if this was done did not materialize, and everybody was happy. In fact, today, about a third of the improvement club's membership is composed of country women.

The next job was to clean up that park. The men of the town donated their time and the women served sandwiches and coffee all day.

A humane society was formed within the civic society and soon the latter took over the lyceum course, and saw that through. The next thing a public rest room for the women was established in the basement of the public library. Baby beds were provided and a matron was employed, so that women could leave their children there while they went shopping.

But finally came the big project. Long hours the women of the civic society had worked on Red Cross supplies during the hard days of the war, and the question had often arisen as to what should be done for the boys when they returned. It had frequently been suggested that a suitable place should be provided where the boys might talk things over; in fact, where the entire community might get together and talk things over. And that was the beginning of the community building.

Facing the park, which the women had so effectually brushed and combed, was an old hotel, an eyesore to the town. The owner had agreed to remove the hotel, provided some one would buy the lot for $1,750. The civic improvement society took him at his word and bought the lot. The women pledged the first $1,000 toward a community memorial building, provided the town would see it through. It was decided that the project must be paid for by public subscription. This was a big proposition, and it was necessary to obtain the co-operation of every one; and, of course, when it came to giving large sums of money, the men folks were taken into consideration. There were, of course, many large subscriptions from well-to-do business men, but there were also unique entertainments for raising money. Pigs, calves, horses, furnishing goods donated by merchants, were auctioned off, even doughnuts bringing $1 each. Individual organizations and clubs in Lake City pledged themselves to raise money. Finally virtually the entire $80,000 necessary for erecting the building had been raised by public subscription.

It was but a short time ago that I visited this community building and saw what had been accomplished. Facing one corner of the park is the memorial building, constructed of a light reddish brick with white cut stone trimmings. At the very top of the building are three stone slabs with the inscriptions, "Soldiers," "Sailors," "Marines." Over each of the three doors is a stone arch. One of these is inscribed "San Juan, Santiago, Manila Bay." The second arch is inscribed "Shiloh, Antietam, Gettysburg." The third arch has the inscription, "St. Mihiel, the Argonne, Chateau Thierry." The structure is not only a memorial to the soldiers and sailors who served in the World War, but to the veterans of the three great wars of our last century.

The doors open into a foyer and then into a spacious lobby. On one side is the council chamber, reserved for the meetings of the town council. A cloakroom is at the other side of the lobby. From the lobby one enters the auditorium. The seats are movable so that the floor can be used for dancing or other entertainments. There is a large stage. This theater has been one of the most delightful features of the building, for it makes it possible to have outside as well as home talent performances.

Stairways lead to the second floor from both sides of the lobby. There is a large hall on the second floor. This is the trophy room, and here all relics of the war and community keepsakes are on display. The service flag hangs along one side of the hall. This hall opens into the balcony of the auditorium. At one side is a room for the American Legion and at the other side is a men's smoking room.

Across almost the entire front of the building on the second floor is the women's rest room. Directly off the rest room is a nursery, where women may leave their babies while shopping. The rest room is always in charge of a matron. It is here that the women of the town are always free to come and talk, and this is where the different women's organizations hold their meetings.

The building itself is under the management of a community congress, composed of three members, including at this writing Fred Boldes, George Pearen and Mrs. I. D. Weirick. They, in co-operation with the town council, have supervision of the building. In fact, the state of Iowa now has a special law providing for the erection and maintenance of buildings such as this. It even provides that communities may issue Liberty Memorial bonds for the erection of these memorials, which may take the form of a library, assembly hall, gymnasium, or include any of these features. Club rooms and rest rooms may be provided, and the building also may contain offices for any county or municipal purpose. A tax levy of three mills is provided for maintenance. Gifts and bequests also are authorized to be received for such buildings.

The Lake City building, perhaps the first community building of its kind to be erected in Iowa, probably will have the benefit of the three mill levy for maintenance, although it was erected by public subscription. At the present time the profits derived from the use of the building are used to extinguish a small debt. The building can be made practically self-supporting without any recourse to the levy. As much as $800 has been taken in from a two-day entertainment.

Probably the greatest reward from this community project is the good feeling that it engenders. Anybody in the town or surrounding country feels perfectly free in making use of the building.

There is something doing at the building nearly every day in the week. The Farmers' Club has the auditorium for its dance and big dinner every Monday night. There also is a women's club from the near-by country that holds its meetings at the community club regularly. The high school finds it a great place for its class plays.

Nor does one forget that this is a memorial building. The coziness of the American Legion quarters suggests something of the good feeling that will bind the boys together, while the trophy room will become a source of unending inspiration to young people, with all important accomplishments of the community and its citizens recorded therein.

Above—In the trophy room on the second floor. In this room will be kept all of the trophies and community relics. Insert—The nursery where women leave their babies while they go shopping. Below—Quarters for the American Legion in the memorial building.

Benedict Arnold and Jewish Aid in Shady Deal

Narrative of Conspiracy Between Maj. Franks and Gen. Arnold to Loot Americans Under Cover of Military Authority; Speculating in Contraband

WHILE Benedict Arnold was in Canada and David Solesbury Franks, the Jew of Montreal and a British subject, was serving as quartermaster to the American troops, David Franks, of Philadelphia, a member of the same Jewish family and of the same Jewish syndicate of army-contractors, was also engaged in an interesting business.

It has already been shown that this David Franks, the Philadelphia Jew, had gone part way with the colonists in their protests against British colonial rule. That this was not sincerity on his part, his subsequent actions proved. He first comes into the purview of this narrative in 1775, the year in which Benedict Arnold performed the remarkable feat of marching into Canada, whence he was sending back into the colonies numerous Canadian prisoners. These prisoners were kept in the New England colonies for a time, but were later collected into Pennsylvania, some of them being quartered in the city of Philadelphia.

An Early Jewish Traitor to the U. S.

HOW inspired it is impossible now to tell, but presently a committee of the Continental Congress proposes that Mr. David Franks be commissioned to feed and otherwise care for these British prisoners, and be allowed to sell his bills for as much money as may be necessary for the purpose. Of course, in accepting this proposal, Franks was only pursuing the course for which he and his numerous relatives had come to America. He was really doing business with and for Moses Franks, the head of the family syndicate in London. Shortly afterward we read of David under the mouth-filling title of "Agent to the Contractors for Victualing the Troops of the King of Great Britain," and to check him up, a British officer was allowed to pass the lines once a month and spend a few hours with David. That this was a dangerous practice may be deduced from his further story.

In the records of the Continental Congress is a request from Franks that he be permitted to go to New York, then the British headquarters; and such was the power of the man that his request was granted on condition that he pledged his word "not to give any intelligence to the enemy" and to return to Philadelphia.

In January, 1778, six months before Benedict Arnold took command of Philadelphia, David Franks got himself into trouble. A letter of his was intercepted on its way to England. The letter was intended for Moses Franks, of London, and was concealed under cover of a letter to a captain in a regiment commanded by a British general who had married Franks' sister. It appears on the record of the American Congress "that the contents of the letter manifest a disposition and intentions inimical to the safety and liberty of the United States."

Whereupon it was "Resolved, that Major General Arnold be directed to cause the said David Franks forthwith to be arrested, and conveyed to the new gaol in this city (Philadelphia), there to be confined until the further order of Congress."

Thus Benedict Arnold comes into contact with another member of the Franks family, whose name was to be so closely associated with the great treason.

A Slippery Gentleman of Much Influence

AND now begins a serpentine course of twistings and turnings which are so delightfully Jewish as to be worth restating if only to show how true the race remains to its character through the centuries. It is in October, about the eleventh day of the month. Franks is imprisoned and remains a week. Then by strange reasoning it is discovered that the United States has no jurisdiction over the charge of treason against the United States (!) and that the prisoner should be handed over to the Supreme Executive Council of the state of Pennsylvania. It follows that the state of Pennsylvania has nothing to do with the crime of treason against the United States either, and in spite of the contents of the letters and the findings of the Congressional Committee thereon, David Franks smiles pleasantly and goes free! It was a time, of course, when much money was lent by Jews to public officials. The Jew, Haym Salomon, was credited with having most of the "fathers" on his books, but he did not charge them interest nor principal. He grew immensely wealthy, however, and was the recipient, in lieu of interest and repayment, of many official favors. David Franks, likewise a wealthy man, charged with treason, has his case transferred and finally dismissed. It is a trick not unknown today.

The Jewish records give much credit to Mr. Franks for not being daunted by this experience. Whether he is entitled to particular credit for his courage when he was master of so much influence, is a matter for the reader to decide, but that he was undaunted his subsequent actions show. He is very soon on the records again with an appeal for permission for his secretary to go again to New York within the British lines. He appeals to the Council of Pennsylvania. The Council refers him to Congress. Congress says it has no objection, if the secretary will be governed by General George Washington's orders in the matter. Washington's aide-de-camp gives permission, and the secretary gives sufficient bonds and sets out for New York.

Arrived in New York, the secretary discovers that Mr. Franks' presence is necessary and has made all arrangements for his master to go to New York, having even secured British permission to pass the lines. It was made very easy for Congress, it had only to say yes. But this time Congress said "no." The former escape of Franks made people aware of an un-American influence at work. After his first arrest he was regarded as dangerous to the American cause. He apparently succeeds in living well in Philadelphia in spite of his difficulties, living even gayly with the society of the city.

Up to this time, David Franks had come into contact with the two principal figures in Arnold's treason. As purveyor to the captured troops, Franks had met and entertained, in 1776, the young and engaging Major André, who in 1780 was to become the tragic victim of Arnold's perfidy. And in 1778 Franks had been the subject of an order of arrest given to General Benedict Arnold. Jacob Mordecai "mentions that it was at Mr. Franks' house that he met Major André, then a paroled prisoner, who was passing his idle hours and exercising his talents in the most agreeable ways by taking a miniature likeness of the beautiful Miss Franks." (American Jewish Historical Society, Vol. 6, page 41.)

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

A Bit of Important Neglected History

IN THE meantime, Benedict Arnold was pursuing his career, a career strangely checkered with brilliant bravery and subtle knavery, a career sustained by the confidence of noble friends who believed in Arnold even against himself. Except for this strange power of holding friends in spite of what they knew of him, Arnold's career would have terminated before it did. That psychic gift of his, and the desperate need of the Continental cause for military leaders, held him on until his moral turpitude matured for the final collapse. As before stated, there is no intention to minimize Arnold's services to his country, but there is a determination to show what were his associations during the period of his moral decline, and thus fill in the gaps of history and account for the distrust with which the American Congress regarded the young general.

David Solesbury Franks, the Montreal Jew, who was an agent of the Franks army-contractor syndicate in Canada, came south to the American colonies with Arnold when the American Army retreated. In his own account of himself, written in 1789—eight years after the treason—he makes so little of his association with Arnold that were it not for the reports of certain courts-martial it would be impossible to determine how close the two men had been. In his record of himself, as preserved in the tenth volume of the American Jewish Historical Society's publications, he admits leaving Canada with the Americans in 1776 and remaining attached to the American Army until the surrender of Burgoyne, which occurred late in 1777. He then lightly passes over an important period which saw the command of Philadelphia bestowed on General Arnold. He mentions simply that he was "in Arnold's military family at West Point until his desertion," which was in 1780. Reference to the first court-martial of Arnold, in which Colonel David Solesbury Franks was Arnold's chief witness, will show, however, that Franks and Arnold were more closely associated than the former would care to admit after Arnold's name had become anathema. Indeed, as the Jewish Historical Society's note correctly observes, the account of this court-martial "is of much interest, as it bears directly upon the relations of General Arnold and his aid, Major David S. Franks, before the traitor's final flight in September, 1780."

There were in all eight charges preferred against Arnold, the second one being—"In having shut up the shops and stores on his arrival in the city (Philadelphia), so as even to prevent officers of the army from purchasing, while he privately made considerable purchases for his own benefit, as is alleged and believed."

Follows a supporting affidavit, printed in the style of the original, with emphatic italics added:

The Deal Between Arnold and the Jew

"ON THE seventh day of May, A. D. 1779, before me Plunket Fleeson, Esq., one of the justices, etc., for the city of Philadelphia, comes colonel John Fitzgerald, late aid de camp to his excellency general Washington, and being duly sworn according to law, deposeth and saith: That on the evening of the day on which the British forces left Philadelphia, he and Major David S. Franks, aid de camp to major Arnold, went to the house of miss Brackenberry, and lodged there that night; and *the next morning, major Franks having gone down stairs, the deponent going into the front room of the said house,* to view colonel Jackson's regiment then marching into the city, *saw lying in the window two open papers;* that on casting his eye on one of them, he was surprised *it contained instructions to the said major Franks to purchase European and East Indian goods in the city of Philadelphia, to any amount, for the payment of which the writer would furnish major Franks with the money, and the same paper contained also a strict charge to the said Franks not to make known to his most intimate acquaintance that the writer was concerned in the proposed purchase;* that *these instructions were not signed,* but appeared to the deponent to be in the hand-writing of major general Arnold, whether or not there was a date to it the deponent doth not recollect; that the other paper contained instructions signed by major general Arnold, directing major Franks to purchase for the said general Arnold some necessaries for the use of his table; that *the deponent compared the writing of the two papers and verily believes that they were both written by major general Arnold's own hand;* and *soon afterward major Franks came into the room and took the papers away,* as the deponent supposes. And further the deponent saith not.

"Sworn, etc. John Fitzgerald."

That such a charge involved as much the trial of Major Franks as General Arnold, will at once appear. The statements in the charge argue close association between Arnold and Franks. Yet in Franks' written record of himself in 1789 he passes over this Philadelphia period thus lightly: "In 1778, after the evacuation of Philadelphia by the British Army & on the arrival of Count D'Estaing I procured Letters of recommendation from the Board of War . . . . and joined him off Sandy Hook, I continued with that Admiral until he arrived at Rhode Island, where on the failure of the Expedition I returned to Philadelphia where my military duty called me."

The Jew "Explains" for Arnold

NO REFERENCE here, nor anywhere in his record, to a closeness of bond between the two which his testimony, now offered from the records, amply proves to have existed.

"The judge-advocate produced major Franks, aid-de-camp to major General Arnold, who was sworn.

"Q. On General Arnold's arrival in Philadelphia, do you know whether himself or any person on his account, made any considerable purchases of goods?

"A. I do not.

"Q. At or before general Arnold's arrival in Philadelphia did you receive orders from general Arnold to purchase goods, or do you know of general Arnold's having given orders to any other person to make purchases of goods?

"A. *I did receive from general Arnold that paper which colonel Fitzgerald has mentioned in his deposition.* There are circumstances leading

to it which I must explain. I had, by being in the army, injured my private affairs very considerably, and meant to leave it, if a proper opportunity *to enter into business* should happen. *I had several conversations on the subject with general Arnold,* who promised me all the assistance in his power; *he was to participate in the profits of the business I was to enter into.* At that time, *previous to our going into Philadelphia, I had several particular conversations with him, and thought that the period in which I might leave the army with honor and enter into business (had come). I received at that time, or about that time, I think several days before the enemy evacuated the city, the paper mentioned in colonel Fitzgerald's deposition that was not signed, as well as the other.* Upon our coming into town we had a variety of military business to do. I did not purchase any goods, neither did I leave the army. That paper was entirely neglected, neither did I think anything concerning it until I heard of colonel Fitzgerald's deposition. General Arnold has told me since, which is since I came from Carolina some time in August last, that the reason for his not supporting me in business was, supposing that I had left the army, it was incompatible with his excellency's instructions and the resolution of Congress."

The Undisputed Facts in the Case

THIS testimony, seemingly straightforward in form, is rather damning to the characters of both the men involved. Arnold, upon taking command of Philadelphia, ordered the stores and shops to be closed and no goods sold. He stopped business outright. It was a most unpopular order, because it prevented the merchants profiting by the new order of things, the return of the Americans.

The very first day the closing law is in force, Arnold writes an order to Franks to make large purchases of European and East Indian goods "to any amount" and to keep the transaction secret from his most intimate acquaintance. That is, Benedict Arnold and the Jewish major on his staff, have an understanding that under cover of the military closing, they will loot the city of its most profitable goods at the enforced low selling prices—for the obvious purpose of selling at higher prices when the military order was rescinded.

These are the undisputed facts. Colonel Fitzgerald saw the papers and knew the unsigned one to be in Arnold's handwriting, even as the signed one was. They were both addressed to the Jewish Major Franks. In his testimony, Major Franks admits the existence of the unsigned order as Colonel Fitzgerald saw it, and admits also its character.

Even Benedict Arnold admitted the order, but he endeavored to show that having exhibited General Washington's orders to him (Arnold) to command Philadelphia, that fact would be a sufficient countermand to the order given to Franks to load up on valuable goods.

> "General Arnold to Major Franks. Did you not suppose my showing you the instructions from general Washington to me, previous to your going into the city, a sufficient countermand of the order I had given you to purchase goods?
>
> "Major Franks. I did not form any supposition on the subject."

Guilty of Intention if Not of Act

THIS admission that he wrote the order, and the fact that no large purchases of goods could be shown, constituted Arnold's defense. It requires no keen legal mind to show its weakness. If the order was countermanded several days before they entered the city, what was it doing in Miss Brackenberry's house in Philadelphia on the first morning of Arnold's command and the first morning of the operation of his order to close the stores? And why did Franks come in search of it? Discarded orders are not thus carried around and preserved.

Probably no purchases were made. Probably the order was not carried out. When Colonel Fitzgerald walked into the room early in the morning and saw the papers, and when soon thereafter Major Franks walked into the room and saw both Colonel Fitzgerald and the papers, there was nothing else to do than to call the plan off. It had become *known.* Colonel Fitzgerald waited in the room to see what became of the papers. He saw the Jew Franks come and get them. He saw him go out with them. He knew what those papers directed the Jew to do, and he knew that the directing hand was Benedict Arnold's. Doubtless with this clue he kept his eyes open in Philadelphia during the operation of the closing order. And doubtless Franks lost no time in transmitting to General Arnold the fact that he found Colonel Fitzgerald in the room where the papers had been left. The inadvertent visit of Colonel Fitzgerald is the key-fact in that phase of the matter.

But the Jewish major, becomes talkative in his effort to explain the situation. "There are circumstances which I must explain," he says. And then, in words that were frequently in the mouth of Arnold, he represents that his service in the army was injuring his private affairs very seriously, and that he was contemplating retiring from the army and going into business.

It is worth noting at this point that numerous opportunities were given Franks to retire, both before and after the Arnold treason, but he developed into a persistent clamorer after official jobs. In spite of his testimony, he could not be shaken loose from public employment.

Evidence of Arnold's Intimacy With Jew

AND then Franks revealed the whole secret of his relations with Arnold. They were in close association in profiteering matters. "I had several conversations on the subject with general Arnold . . . . he was to participate in the profits of the business I was to enter into." Arnold was to remain a general in the army; his aide was to get out of the army and work with him privately, sharing the profits.

But what had all this to do with the orders to close the stores at Philadelphia? What had this to do with the papers found by Colonel Fitzgerald? For after all, this was the "circumstance" which Major Franks had set out to explain. At last he reaches it: "At that time, previous to our going into Philadelphia, I had several particular conversations with him . . . . I received at that time, or about that time, the paper mentioned in Colonel Fitzgerald's deposition which was not signed, as well as the other."

The paper authorized him to get the most merchantable goods out of the closed stores. It followed upon "several particular conversations" about the business of which Arnold was to "participate in the profits." But, apparently, the deal did not go through. Colonel Fitzgerald's untimely appearance, and the carelessness of someone in leaving the papers about, were most unfavorable to the Arnold-Franks project.

There can be no question of the intimacy of the relations between the Jew and Arnold and the use that both made of their relationship. There can be no question, either, that these relationships must have been the result of continuous acquaintance and testing.

Merely to show that a Jew once crossed the path of Benedict Arnold and was implicated with him in a discreditable scheme that probably did not fully mature, means nothing. But that this Jew was involved in Arnold's fortunes from the time the two first met in Canada until the day that Arnold betrayed his country, may mean something. And that is the case. From the time of their first meeting, their lines run along together—Franks always being relied upon by Arnold as the credible witness who extricates him from his scrapes, and Franks usually doing it with a sort of clumsy success, as in the instance just cited.

They Both Desire the Sea at Same Time

THE reader may refer now to the reference made above to Franks' record of himself in which he mentions having joined Count D'Estaigne, the French admiral, at Sandy Hook. This was just a month after Arnold took command at Philadelphia, just a month after the events on which the above charge was based. Evidently Franks got out of town for a little while. He would notice the coolness of his fellow officers among whom reports of Colonel Fitzgerald's discovery must have circulated. There would be no prejudice against him because he was a Jew, it would be solely due to the suspicions concerning him. Indeed, readers of the ordinary history will never learn that Arnold had Jews around him. There were David Franks, moneyed man and merchant in the city, and David Solesbury Franks on Arnold's staff—both outstanding figures, yet wholly passed over by the historians, with one or two exceptions, and even these have never caught the Jewish clue. In that day there was no prejudice against Jews as Jews, even as there is none now.

Franks, then, easily gains letters which permit him to join the French fleet of D'Estaigne, within a month after the Philadelphia business. And strange to relate, at precisely the same time, Benedict Arnold conceived the notion that he too should go into the navy, and a month after his appointment to Philadelphia he writes to General Washington suggesting nothing less than that he be given command of the American Navy! —at precisely the time Major Franks takes to the water.

". . . . being obliged entirely to neglect my private affairs since I have been in the service," Arnold writes to General Washington, "has induced me to wish to retire from public business, unless an offer, *which my friends have mentioned,* should be made to me of the command of the navy . . . . I must beg leave to request your sentiments respecting a command in the navy."

So far as the historians have been able to discover, no one ever proposed such a thing as making Arnold the admiral of the American Navy. But, then, the historians did not know David S. Franks. He, a landsman, had gone for a few weeks with the French ships. Perhaps he was the friend who "mentioned" the matter. At any rate, when Franks came off the ships again, it was to serve as witness once more for Benedict Arnold.

The charges against Arnold were such as these: Permitting an enemy ship to land, and buying a share in her cargo; imposing menial service on soldiers (a charge brought about by an action of Major Franks); issuing passes unlawfully—the case in point being that of a Jewess, named Levy; the use of army wagons for his private affairs, and so forth.

This is Major Franks' testimony concerning Arnold's permitting "The Charming Nancy" to land at a United States port, contrary to law:

"Q. (by the court) Do you know whether general Arnold purchased any part of the Charming Nancy or her cargo?

"A. I do not know of my own knowledge, but I have heard general Arnold say he did, and I have also heard Mr. Seagrove say he did.

"Q. Was it previous or subsequent to general Arnold's granting the pass?

"A. It was subsequent."

Trading in Contraband Under Washington's Nose

HERE is a complete admission of all the facts, but the defense consisted in laboriously showing, by means of quite leading questions addressed to Franks, that the owners of "The Charming Nancy" were indeed good Americans though residing and doing business in enemy territory. Franks was rather useful in this part of the business, and the court, overlooking the other elements, simply found that the permission which Arnold gave to "The Charming Nancy" was illegal. The fact that a major general of the United States Army speculated in the cargo of the ship which had come into port in violation of law and on his military permission, was not considered at all. Neither was the fact, stated in the charge, that he gave this permission while he was in camp with General Washington at Valley Forge, whom he did not consult in any way.

But here again the fact is established that Major Franks was privy to the whole matter, and was the chief witness for Arnold's defense.

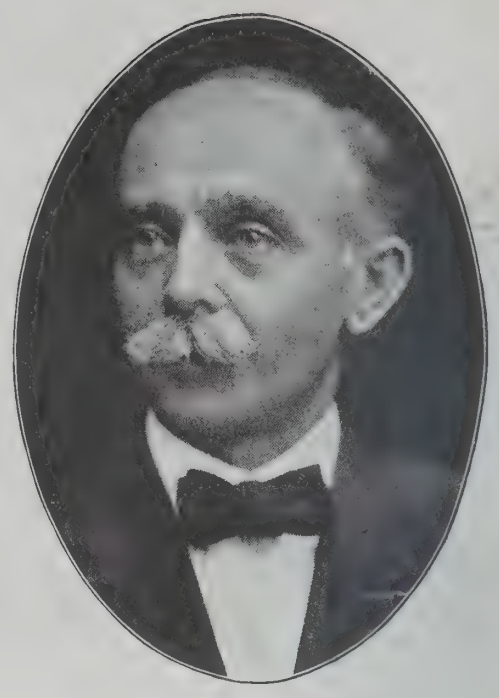
If it had occurred but once, as at Montreal, that Arnold had been charged with irregularities involving profitable goods; or if it had occurred but once, as at Philadelphia, that Major Franks happened to be the chief available witness, no serious notice could be taken of it.

But time and again Arnold is caught in shady acts involving profitable goods, and time and again the Jewish Major Franks is his accomplice and chief witness. And this partnership in shady transactions, extending from the time Arnold first met Franks till the time Arnold betrayed his country, is significant, at least as a contribution to history, and possibly as a side light on the gradual degeneration of Benedict Arnold.

The First Snuffer on Arnold

ARNOLD could no longer wholly escape. But still the good fortune that seemed patiently to accompany him, as if waiting for his better nature to recover from some dark spell, remained with him; the court could not exonerate him entirely, but neither could they punish him as he deserved; and so it was given as a verdict that General Arnold should be reprimanded by General Washington, his best friend.

Washington's reprimand is one of the finest utterances in human record. It would have saved a man in whom a shred of moral determination remained:



> "Our profession is the chastest of all; even the shadow of a fault tarnishes the luster of our finest achievements. The least inadvertence may rob us of the public favor, so hard to be acquired. I reprimand you for having forgotten that in proportion as you have rendered yourself formidable to our enemies, you should have been guarded and temperate in your deportment toward your fellow-citizens. Exhibit anew those noble qualities which have placed you on the list of our most valued commanders. I will myself furnish you, as far as it may be in my power, with opportunities of regaining the esteem of your country."

It was a bad day for Benedict Arnold when he got into touch with the Jewish syndicate of army-contractors. There was hope for him even yet, if he would cast off the evil spell. But time pressed; events were culminating; the alien, having gripped him, was about to make the best of the baleful opportunity. The closing chapter was about to be written in glory or in shame.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages, respectively, sent to any address upon receipt of 25 cents for each volume.

The Man Who Made It Safe To Take a Drink

By FRANK M. CHASE

DR. S. J. CRUMBINE,

Secretary Kansas State Board of Health

THIS is the story of the man who made it safe to take a drink. He is Dr. Samuel J. Crumbine, who banished the common drinking cup from Kansas, the first state to legislate it out of business. He also originated the "Swat the fly" slogan, as well as the movement bearing its name, both of which have gone around the world.

Dr. Crumbine was born in Emlenton, Pennsylvania, September 17, 1862, and was educated at the Cincinnati College of Medicine and Surgery. He went to Kansas in 1885. For a location he chose the frontier settlement of Dodge City, then notorious throughout the West as probably the most lawless town on the whole long cattle trail from Texas to the Dakotas. The yip-yip-yippy of the cowboys was still heard there when the young physician hung out his sign, and Boot Hill—the special burying ground near the city for the men who died with their boots on—still received its victims. Crumbine, however, blessed with the sense to mind his own business, got along without trouble. Despite its trials, too, he came to enjoy the strenuous life of the region, developing a self-reliance and knowledge of Western ways that have stood him well in the battles that were to come. Meanwhile he prospered, marrying Miss Katherine Zuercher, of Springfield, Ohio, in 1890. He also became the health officer of his county, and in 1898 was appointed a member of the State Board of Health. On the death of the board's former secretary, Dr. U. B. Swan, in the summer of 1902, Crumbine was offered the position.

Salary Only $1,200 Then

DR. CRUMBINE was not certain that it would be advisable to accept it, for the secretary's position was then small indeed. The salary was but $1,200 a year, this being for part time services, the incumbent devoting the remainder of his time to private practice. Acceptance of the offer thus meant the abandonment of an established business at Dodge City and the starting of a new one at Topeka—a matter not to be decided offhand. After delaying his decision two years, however, and at the urgent solicitation of the board, he accepted the secretaryship, taking up its duties July 1, 1904.

On becoming secretary, he realized at once the hopeless inadequacy of the work of the State Board of Health. He had but one assistant, a stenographer, who, like himself, served only part of the time. Nor was the pitiful appropriation of $2,000 a year the only reason for the lack of action. The real reason was that the statute books contained almost no laws concerning health, so that the secretary was practically powerless. Crumbine accordingly planned to obtain laws granting his office more authority, and in 1907 the legislature adopted several such measures. Among them were two proving very important, the food and drug law and the water and sewage law, both of which have been copied by numerous states.

Meanwhile, he went ahead with a great deal of new work without having specific legal authority. In 1905 he bought samples of many foods on sale in Topeka, and sent them to the University of Kansas for analysis. This investigation revealed astonishing cases of adulteration and use of preservatives, the findings helping materially toward obtaining some of the desired legislation. Later he kept numerous pens of dogs at his home, some of which he fed "embalmed beef" and meat preserved with benzoate of soda, comparing the results with those from the dogs receiving equal quantities of less questionable meats.

Posting the Public

IN THE same year he began to publish the monthly *Bulletin* of the Kansas State Board of Health, the purpose being to inform the public of the work of the secretary's office; and in the issue for January, 1906, printed the results of the food analyses. This caused a sensation, and headed Crumbine into his first big fight. It not only aroused the first state-wide interest in the board of health, but likewise the war dogs of the food interests affected. Influential business men waited on the governor, with the obvious intent of having Crumbine "fired."

But the secretary, backed by the governor and the results of his own investigations, stood his ground, and after a hard fight in which the hand of the "interests" was plainly seen, the legislature passed the food and drug law. As a result of this and other legislation, the secretary's office was put on a full-time basis and permitted to employ six food inspectors and a clerk, while the passage of the water and sewage bill enabled Dr. Crumbine to add an engineer, to be stationed at the state university, to enforce that law. The office force thus quickly increased from the secretary and his stenographer, both on part time, to nine persons on full time.

By passing the food and drug measure in 1907, the same year as the Federal food and drug act became law, Kansas assumed the lead among the states in tackling the false claims made for patent medicines.

It was while working on the adulterated food problem that, in the spring of 1906, he laid the foundation for the vigorous warfare against flies in which we are still engaged. Of course, we fought flies in those days, but not so pointedly and persistently as now; we weren't then aware of the long list of sins that are now placed at the door—or more properly, the feet—of the fly. So, in preparing the copy for the April issue of the *Bulletin,* which was to be a special "fly" number, he planned, as usual, to emphasize the screening of homes to keep flies out, largely as a matter of personal comfort. But he was also thinking of the discovery, made during the Spanish-American War, that the fly carries disease, and, still interested in pure food, came to the conclusion that to protect it against flies is quite as important as to insure its freedom from adulterants. All these ideas were to be presented in the next *Bulletin,* so that for the time his thoughts were well seasoned with flies.

Origin of "Swat the Fly"

TOPEKA was then in the Western Baseball League, and while he was engaged in writing his "fly" issue the first game of the season occurred. Nearly everybody in town went to the opening game and Crumbine, a deep-dyed enthusiast for the sport, was there, of course. The teams were evenly matched, and in the last half of the eighth inning the score stood two to two. Topeka was at the bat, with one man out and one on third. Naturally the fans were an excited lot at this point, and many of them yelled, as the next batter stepped to the plate, "Sacrifice fly! Sacrifice fly!" At the first ball pitched, the batter struck—and missed. Then, during that lull which always accompanies disappointment in the bleachers, some stentorian voice boomed out, *"Swat that ball!"* Crumbine didn't see the next play, for he was engaged in pulling an old envelope from his pocket and jotted down the slogan destined to circle the globe: "Swat the fly."

For a day or two he forgot about the notation, but when the copy for the *Bulletin* was ready he placed it on the front page. This in itself, of course, did not make "Swat the fly" famous, but succeeding events brought it quickly into prominence. Annual clean-up campaigns were then being started in many places, and in connection with the one at Weir City, Kansas, a teacher had the idea of using the Boy Scout organization in this work. This idea he put in a letter to Dr. Crumbine. Crumbine instantly saw the value in the plan and could scarcely wait to write the teacher to compliment him on his vision. The teacher also had asked for suggestions concerning the kind of work which the boys might do. In answer the secretary suggested an anti-fly campaign, and sent the teacher a copy of the current *Bulletin.* He also wrote the teacher a long letter giving details for arranging such a project, and urging particularly that stable refuse piles, the special breeding places of flies, be removed from the town. The teacher acted immediately on all these suggestions. This was perhaps the first instance of Boy Scouts engaging in civic work.

From this beginning the clean-up and anti-fly campaigns spread apace and with them the slogan, except that "Swat the fly" traveled faster because of its briefness and epigrammatic form. Soon it was known from coast to coast, and then taken up across the seas.

Aboard a through train to the Southwest one day in 1908, Dr. Crumbine noticed two persons obviously suffering from tuberculosis in its later stages, drinking from the cup at the water fountain, while shortly afterward their fellow travelers—men, women and children—used the same cup. Dr. Crumbine had just been studying the methods of disease transmission and, as he watched the foregoing procedure, became deeply concerned over the danger involved. The insinct to investigate then arising, he strolled casually through the train, on which he found 11 persons who were obviously tubercular. Here, he saw, was a situation challenging his attention; for, inasmuch as every train bound for the Southwest passed through Kansas for several hundred miles and each was probably carrying one or more tubercular persons, the drinking cups on these trains were a potent means of seeding the state with tuberculosis.

He Proved It by Evidence

PLACING his facts and observations and conclusions before the State Board of Health at its next meeting, he asked that it issue an order abolishing the common drinking cup on railroad trains, in schools and in all public places. But those were the days of tremendous railroad influence and the board, while previously giving Crumbine excellent support, balked at this request.

The secretary, now faced with the necessity of proving the wisdom of his stand to the board, set out for evidence that would convince the most skeptical. At the state university he obtained the services of a bacteriologist who, under Crumbine's direction, took cultures from all the drinking cups on trains running into the old union station at Kansas City during one week. The results showed that a great variety of diseases was being passed around by this medium, some of the worst known to science among them.

So conclusive was this evidence that Dr. Crumbine did not wait for a meeting of the board, but mailed copies of the report to the managers of all railroads operating in Kansas, asking them whether they would agree to abide by a board of health order, if issued, prohibiting the use of common drinking cups on trains and in other public places. In every case where the matter was referred to the medical departments of the railroads, there was hearty agreement. This won the battle for Crumbine, and at the next meeting of the board the order was issued. This became effective September 1, 1909, since which Federal and state laws, as well as public opinion, have rapidly removed one of our national terrors—the common drinking cup.

Drives Out the Common Towel

THAT other arch-spreader of disease, the common towel, was the next to receive his attention. Here the method of attack was similar to that on the public drinking cup, the material adhering to the towels gathered in the public places of six Kansas towns being analyzed at his direction. Twenty-five per cent of the towels examined were found to be contaminated with fecal material, their hazard to health thus being enormous. This evidence convinced the members of the State Board of Health of the danger lurking in the common towel, and they at once decreed that its use "in hotels, railway trains, railway stations, public and private schools" should cease, the order taking effect September 1, 1911.

Dr. Crumbine's work toward the control of tuberculosis has not only placed Kansas among the foremost states for intelligent handling of the disease, but has also established him as a leading authority on it. He organized the Kansas Tuberculosis Association, serving as its first president. He is now a director of the National Tuberculosis Association, and has served a number of other important organizations in various high capacities. Early in the summer of 1921 he was elected secretary of the National Health Council, a super-organization of nearly a dozen national health agencies, his selection for this position being a notable compliment to his ability and standing among public health workers.

The work of Dr. Crumbine has been distinctly of the kind that sets the world ahead.

HEALTH

By DR. S. J. CRUMBINE

HEALTH is a state of physical, mental and moral equilibrium, a normal functionating of body, mind and soul. It is the state when work is a pleasure, when the world looks good and beautiful, and the battle of life seems worth while. Health is the antithesis of disease, degeneracy and crime.

The laws of health are as inexorable as the law of gravitation, as exacting as eternal justice, as relentless as fate, and their violation is the beginning and cause of all disease, suffering and sin.

Health is the most desirable of earthly blessings. When finally lost it cannot be purchased by uncounted millions, restored by the alienist, nor returned by the pulpit.

Health is that state of happiness, faith and love whose prototype was the first man—Adam; whose ideal is the Christ.

Fifty Miles in a Local Freight Train

By HOMER KINGSLEY

This is the third of several stories on interesting facts having to do with the operation of a railroad. The next will appear in an early issue.

"SIXTY-EIGHT double O four, ninety-three ball fourteen, two stock and two thirty-ton box set out. We go in the hole for four."

This seeming jargon of meaningless words is what the conductor of the local freight said to the brakeman. It sounded queer, but by the trainman it was perfectly understood.

This is what we would have had to say, had we been trying to say the same thing. "We 'set out' a box car No. 68004, loaded with coal; a flat car No. 93014, loaded with lumber; two empty stock cars, two empty 60,000-pound capacity box cars and then after doing all this work we are to back into the siding to let passenger train No. 4 go by."

There are several peddlers on the freight train. No, they are not the flesh and blood kind with whiskers and hampers and greasy palms, they are cars that contain mixed freight for stations along the line. These cars are opened, loaded or unloaded, at every station and so they are called "peddlers."

These "peddlers" are always near the caboose.

Here is an average freight train of 26 cars. Beginning at the caboose, there are the six "peddler" cars, five empty stock cars, eight empty box cars, two cars of lumber, two cars of gravel, one car of railroad ties, and three cars of coal.

The empties are distributed at stations for stock and grain. The lumber and coal are also "set out" at different stations, as they have been called for. The gravel and ties are material that belongs to the company and are to be unloaded along the line somewhere.

The conductor has checked over his train before he started and made sure that everything was the same as given in the waybills. He has made a record of each car and the seal numbers on each car door.

When the freight stops at the station he hands the bills to the agent, who makes his own record of the seal numbers of the cars before the seals are broken and the door opened. Then the freight in the "peddlers" is checked over and the deliveries made or added and the doors sealed again and the train proceeds to the next station.

As the train makes its run it grows "light." Most of the freight has been left, but then some new freight is added to the "peddler" cars. These cars are taken to the terminals and switched to the big freight houses and their contents shifted about and transferred so that everything will go to its destination. Of course, loaded cars are picked up. There are grain, machinery, and wood; and perhaps fruit that is shipped in a refrigerator car.

As the train travels along the conductor reads a train order to the brakeman: "Train No. 93 will leave two cars of gravel on main line at culvert 446-73. Train No. 94 will pick up the empties." This is fairly plain to a tenderfoot. Two cars of gravel are to be left by our train at this culvert to be loaded by the section men and the local freight, running in the opposite direction, will pick up the empty cars and take them to the station.

Both trains receive this order and the station on each side of the culvert also has a copy of the order. Any train approaching these stations would find the semaphore arm at "stop," and would get a copy of an order reading, "Cars on the main line at culvert 446-73."

But train No. 94 brings these cars in before any train reaches these stations. This is expected, and is what the train dispatcher expected when he made out the orders. But he sent out the other requests merely as a matter of precaution. The culvert is numbered and the 446-73 means it is 446 miles from the general terminal and the 73 is 73/100 miles. All bridges and culverts are so marked.

Reaching the next station the conductor reads the telegram which says, "Run slow, blank to blank, for section men to unload ties."

This means that the section men will go along with the train and while the freight is pulling along slowly the men will throw off the ties. When the car is empty the men get out and go back on the little hand car they have fastened on behind.

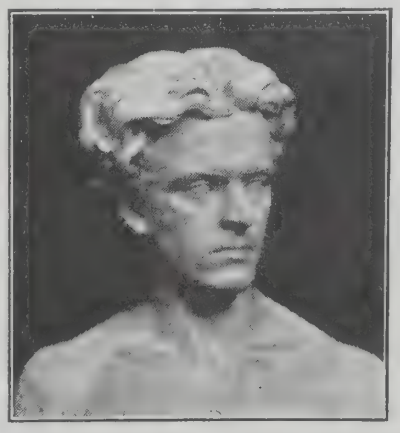
At the end of the run is the great city freight house. The freight sheds of one railway at Chicago are half a mile long, with a covered shed extending another quarter mile. This is the "out" freight house, from where the freight going from the city is received. The "in" freight house is nearly as large.

The doors and cars are all labeled with the names of the stations for which freight will be loaded. At this great freight house there is an average of 600 cars of freight loaded each day. By means of electrically propelled motor trucks they haul the loaded trucks that contain the freight. The "checkers" load up the trucks and hand the "trucker" a small card with the number of the car in which he is to place the freight.

Above—The day of the old-time baggage "smasher" and freight "banger" is gone. Instead the baggage is now handled on big trucks drawn by a little electric tractor which is operated by one man.

Left—The fruit and provision cars have to be reloaded with ice for their refrigerators during the hot weather. Ice also is used in the passenger cars for drinking water. These men have a large cake that they are cutting for the water tank.

The loading is well systematized. The "peddler" cars are filled to the roof. The freight men have a list of the stations and on which side of the track they are, so they load the material accordingly and on the side that will make it easiest to remove. The freight cars are also connected according to order.



After the loading is finished the switch engines pull out the cars and place them in trains for departure. Then there are the manifest, or through trains. These are handled separately. They are sent to the division points, from where they are distributed by the local freights.

John G. Neihardt, Poet Laureate of Nebraska

(Concluded from page 2)

Many other poems and stories have been written by Mr. Neihardt embodying a chain of western circumstance: "The Lonesome Trail," "A Bundle of Myrrh," "The River and I," "The Dawn-Builder," "The Stranger at the Gate," "Life's Lure," "The Quest," "Two Mothers" and "The Splendid Wayfaring."

Contemporaries have risen to pay tribute. The Yale *Review* "fervently prays that these songs may take rank with, if not precedence over, Scott and Tennyson in our schools." Local Neihardtian literary clubs, have been started in several cities and a national organization bearing his name was founded two years ago. Dr. John T. House, a graduate of Chicago University and an intimate friend, has written the poet's biography. The University of Nebraska in 1917, conferred on him the degree of Litterarum Doctor and in 1919 he was awarded the Poetry Society's prize, for the best poem of the year, "The Song of Three Friends." This is another epic of western pioneer life which in chronological order antedates the story revealed in, "The Song of Hugh Glass."

A bust of the poet done by his wife.

Mr. Neihardt points out that the great American epos was developed west of the Missouri River during the nineteenth century, beginning in 1822 and ending in 1890, and he regards the body of legends that grew up about the heroes of that time as "precious saga-stuff." His "Song of Three Friends" and "The Song of Hugh Glass" are historical prose epics dealing with this period, and he is now engaged on a third piece of the cycle, "The Song of the Indian Wars." He believes that the work still to be written by him will require another 15 years.

Probably no single poem has been more quoted before juries and conventions than, "Battle Cry." It is a demand for courage in solving the complex problems of the day. Each generation must meet its battles:

More than half beaten, but fearless,
Facing the storm and the night;
Breathless and reeling, but tearless,
Here in the lull of the fight,
I who bow not but before Thee,
God of the fighting Clan,
Lifting my fists I implore Thee,
Give me the heart of a Man!

What though I live with the winners
Or perish with those who fall?
Only the cowards are sinners,
Fighting the fight is all.
Strong is my Foe—he advances!
Snapt is my blade, O Lord!
See the proud banners and lances!
Oh spare me this stub of a sword!

Give me no pity, nor spare me;
Calm not the wrath of my Foe.
See where he beckons to dare me!
Bleeding, half beaten—I go.
Not for the glory of winning,
Not for the fear of the night;
Shunning the battle is sinning—
Oh spare me the heart to fight!

Red is the mist about me;
Deep is the wound in my side;
"Coward" thou criest to flout me?
O terrible Foe, thou hast lied!
Here with my battle before me,
God of the fighting Clan,
Grant that the woman who bore me
Suffered to suckle a Man!

Since 1912 Neihardt has been literary critic for the Minneapolis *Journal*, reading 10 books and writing seven columns each week.

At his little home built on the same lawn as the home of his aged mother, at Bancroft, Nebraska, surrounded by a wife, who is a sculptress, and three children, Mr. Neihardt spends three forenoons each week writing review criticisms. The afternoons he spends in his garden, or in winter chopping wood or reading, and with it all he keeps a reserve of energy by which he rejoices in the beauties of sky and earth, night and day, his ear attuned to the music of the birds and his mind a filming plate for poems.

Singularly enough, the Neihardt family has been a participant in the long continental migration movement described in these western poems. The original Neihardts settled in Pennsylvania in 1737, descendants of an old Bavarian family, the founder of which was ennobled by Friederich Barbarossa and given large estates near Zweibruecken. Mrs. Neihardt is a daughter of Rudolph Vincent Martinsen, a German-Russian financier, and for some years president of the Missouri, Kansas & Texas Railroad. She took her training in sculpture under the late Auguste Rodin, and some of her work was exhibited at the Paris Salon in 1907. Mr. and Mrs. Neihardt were married in 1908. For them the vanities of life have few attractions.

"—As for me, a cracker box and enough food to keep me going," said Neihardt. "But half of a poet's job is that of being a real he-person, and that is one good reason why I am increasingly glad for my responsibilities. So far, I've done the trick by the simple expedient of producing necessities instead of fighting for money with which to buy them—that is, to a great degree. Soon the world will learn that money is only a medium of exchange! It has temporarily forgotten. Sometimes I have a vision of our world making industry an end instead of a means—and it is terrible.

"What am I, John Neihardt? What matters it that I or some one else should do this work. The individual must be lost in the mass. I am willing, eager to give up my ego, even the memory of my name that my work may be done."

Shell-Shocked in the Great Battle of Life

Mental Disorders Are Often the Result of a Desire to Get Away From the Struggle of Existence

By EDWARD J. BECK

IS everybody more or less insane? What distinguishes a crazy person from one who is normal? These questions I put to a medical friend of mine who is a specialist on mental diseases and the fame of whose competence attracts patients from several states.

"Your question is about as easy to answer as 'How high is up?' or 'How long is a string?'

"It is impossible to give a clear-cut definition of insanity. The border line between mental disorder and actual insanity is often indistinguishable. Just as we have colds, chills and headaches without cataloging ourselves as invalids, so we may be haunted by some obsession or compulsion or be subject to absent-mindedness or forgetfulness without making the term 'crazy' rightly applicable to us.

"What are brains for anyhow? The answer is 'to enable the individual to adjust himself as a whole to his environment.' Insanity is the lack of capacity for efficient adjustment.

"The normal mind, for example, correctly pictures the outside world. It mirrors the environment as it is—it does not habitually see things which are not there nor habitually misinterpret the impressions furnished by the senses.

"The mind relates us to the world of our physical environment; it chooses our vocation; it earns our living; it adjusts us to frictionless relations with our fellows.

"When the mind loses the very capacity to adjust its possessor to the world of the senses, the workaday world or the social world; when it fails to perform its most essential and valuable function, so that the individual becomes a menace to his own interest or a danger to society, then we call the disorder insanity."

Brave Soldiers Were Victims

LOOKING through the literature I found no more useful explanation than this—for practical purposes at least—though the diagnostician has more precise criteria for identifying insanity. Life is a battle, a struggle for life, power and happiness and in the harshness and tumult of the fight, cases of mental abnormality develop very much like the shell-shock of which we heard so much during the war.

During the war, whole hospitals were filled with soldiers who had been shell-shocked; they had lost sight, hearing or memory in some mysterious manner though their seeing and hearing apparatus were unimpaired. The victims of the derangement were often the strongest and bravest men in their units—not nervous weaklings nor cowering sissies.

Psychologists attributed their condition to the suppression of the instinct of flight and its accompanying emotion—fear. The brave soldier did not distinguish between fear and cowardice; one seemed as despicable to him as the other; he dismissed fear from his mind as a sign of weakness instead of regarding it as an inevitable and instinctive reaction to the dangers of modern, large-scale warfare. He had no consciousness of fear but fear was there just the same—hidden unrecognized in the subconscious mind.

In the unconscious mind was a desire to escape, an urging to flight that was strong enough to produce blindness and deafness. The instinctive self reasoned thus: "When I am blind, I am incapacitated, I can go to the rear—so I'll be blind." The bravest soldier could be made a victim of a part of his personality which was deeper-seated than will power or habit. The cure came when that same primitive self was made aware that the war was over and the danger past—though this reassurance was often difficult to transmit except by hypnotic suggestion or a shock of some kind.

Tracing the Cause

IT IS the desire to flee from the battle of existence and to evade unpleasant reality that causes the shell-shock in the battle of life. The same sort of refusal to face facts which caused blindness on the battlefield, produces disintegration of the personality, mental disorder and milder forms of mental disturbance in times of peace.

A hidden conflict between instinct and reason; between desire and conscience; between things as they are and as we would like them to be, causes those eccentricities and derangements which are manifested in varying degrees in everyone and which furnishes some justification for the uncritical dictum that everyone is more or less crazy.

A news item from the daily press offers a typical illustration of how suppressed desires may manifest themselves in grotesque form.

The society columns of Atlanta newspapers announced the engagement of a music teacher whom I shall call Miss Jones to a Dr. Alleyne Hensley, of Quebec, Canada. Two years previously, Miss Jones had been a patient at Johns Hopkins Hospital, Baltimore, and on her return home she informed her family and friends that the physician who had performed her operation had fallen in love with her and had asked her to marry him.

Wedding invitations were mailed out and published notices went so far as to give the details of the forthcoming wedding, stating that the eleven-year-old daughter of Dr. Hensley would be a flower girl.

Miss Jones left Atlanta about the time the engagement was announced saying that she was going to New York to purchase her trousseau. A little later, relatives received a message saying that Dr. Hensley had been badly injured in a train wreck. Another message from Chicago said that he had died before she arrived and that she was bringing the body to Atlanta for burial.

The Atlanta undertaker was doubtful that the body could have been that of a surgeon; it seemed more like the remains of a laborer. The funeral, which was set for a Thursday, was postponed until the family had time to investigate.

Then Miss Jones confessed the truth. There had never been any Dr. Hensley; the letters and presents she had received during the courtship had been ingeniously sent by herself to herself. The body was that of an unidentified tramp who had been killed by a train in the Chicago railroad yards.

Miss Jones had appeared at the office of a Chicago undertaking firm which takes care of burials in potter's field and said she was looking for the body of her husband—Dr. Hensley. When the body of the tramp was shown her, she identified the remains as those of her husband and made arrangements for shipping the body to Atlanta.

The deputy coroner in Chicago said: "She wept incessantly while giving the statement and I never for a minute suspected it was anything but a bona fide identification."

This is an illustration of the results of conflict between a strong mating instinct plus a desire for social recognition, with the cruel facts of life. Condemned by circumstances to celibacy, the unconscious mind would not be denied the fulfillment of its wish, and not finding realization in actual life possible, it found satisfaction at first probably in romantic phantasies or daydreams and later in the elaborate and cleverly-planned fiction told above.

The psychologists tell us that most of the functional mental disorders and many peculiar physical manifestations such as twitchings, stuttering, many cases of skin eruption, even some cases of paralysis, blindness and deafness may be attributed to inner conflict between hidden desires on the one hand and conscience, pride or fear of social disapproval on the other. Or the present condition may be traced back to some shock in childhood or to a submerged discord of personality which had its origin in the faulty handling of the child by its parents. Eccentricities, obsessions and delusions are often derived from the same causes.

Man's Double Nature

TO UNDERSTAND abnormalities of this kind, we must recognize that man has a double nature. First, he has the conscious mind with which he thinks and reasons, and then also an unconscious self, the savage and the baby in him which never grows up. When he is born he comes to the world with a ready-made outfit of instincts—the same equipment which nature gives every infant whether born in the jungles or on Fifth Avenue. Our natures are not modernized. This out-of-date self is the oldest and most deep-seated part of us and the standards of adult life are simply a surface veneer.

Infancy is a care-free time of complete satisfaction in the mother's arms. The baby is just an animated stomach. His is a blissful existence of feeding and sleeping. Everything comes easy—all that is needed to fill a want is a cry.

Conflict begins when the child learns that there are others to be considered also and that the heart's desires do not materialize automatically.

Parents may handle their children wrongly in two different ways and render them susceptible to later mental disorder: they may spoil them or they may bully them.

A child may be so sheltered from unpleasantness and pampered that a mama's darling results. Or it may be capriciously knocked around, denied any understanding of its whims and cowed by parental tyranny. In the latter instance, an inferiority complex may be built up which may end in some form of mental disorder.

Mrs. Smith was a chronic invalid. She had consulted many doctors and lived in numerous sanitariums, all to no avail. Her medical advisers all told her there was nothing organically wrong. The latest specialist happened to be a psycho-analyst and went on the theory that the trouble was caused by some repressed craving. He analyzed Mrs. Smith's dreams to obtain clues as to the nature of the suppressed wish.

"Madame, you wish you were back with your father in the golden days of childhood," said the doctor. "When you fell and hurt yourself your father always petted you and kissed away the pain. As an only daughter, you had too much affection lavished upon you.

"Your husband, though considerate and attentive to your wants, is reserved and withholds the tendernesses of the lover. Your submerged infantile nature yearns for loving attention and to get it, lays you up in bed, because then he must minister to you."

This revelation brought the conflict to the surface and as soon as Mrs. Smith recognized the true state of things, the symptoms left her. Her husband was coached as to the attitude he should take and Mrs. Smith is now a new woman.

A bookkeeper for a wholesale hardware company suffered from writers' cramp and finally felt himself compelled to give up his position. One of the fortunes of the town had been made in the manufacture of cough drops and so the young man decided that he also would acquire wealth by making cough drops.

The young man was undersized in stature and rather chubby-faced. At school he had been taunted about his size and bullied by the other boys. To compensate for his feeling of inferiority, he found satisfaction in the thought that physically he resembled Napoleon. A picture of Napoleon hung on the wall and on the mantle stood a bust of the "Little Corporal." The young man thought of himself vaguely as a coming Napoleon of finance.

He left a few cartons of cough drops with druggists whom he knew and traveled around the country "promoting sales." When the consignments were returned as unsatisfactory because the spring heat caused them to melt into a solid mass, the young man was not dismayed. His identification with the conquering Napoleon and his dreams of wealth warped his judgment and rendered him incapable of seeing the true state of things. When all his savings had been consumed by futile business trips, his dream structure collapsed.

Restoring the Bookkeeper's Balance

THE physician who was treating him for writers' cramp decided that something more than liniment and massage was needed to render him capable of resuming his old occupation of keeping books. He delved into the young man's history and laid bare the hidden motives which explained both the writers' cramp and his dream of empire. The former was caused by his aversion to routine work and the detestation of his position of inferiority at the hardware company. The latter was an example of self-protective delusion whereby a painful complex which is repressed manifests itself in consciousness by an exaggerated development of its opposite. The physician suggested that the young man act as a boy scout leader, thus giving him the satisfaction of superiority and leadership. The bookkeeping is also bearable now, the writers' cramp has disappeared and the young man's reactions to life are normal—because the analysis ended the conflict.

The natural result of craving and ambition is action which brings actual realization. In some cases where the world of reality thwarts realization, recourse is had to daydreaming and the desire of the heart is attained in agreeable mental pictures. Fame, love, money and success are enjoyed in imagination. Daydreaming is the refuge from reality.

William James called attention to the danger of becoming filled with emotions which prompt no deed and are not translated into action. Plays and concerts produce a sentimental effect. James says: "The remedy would be never to suffer oneself to have an emotion at a concert without expressing it afterward in some actual way. Let the expression be the least thing in the world—speaking genially to one's aunt or giving up one's seat in a horse car, if nothing more heroic offers—but let it not fail to take place."

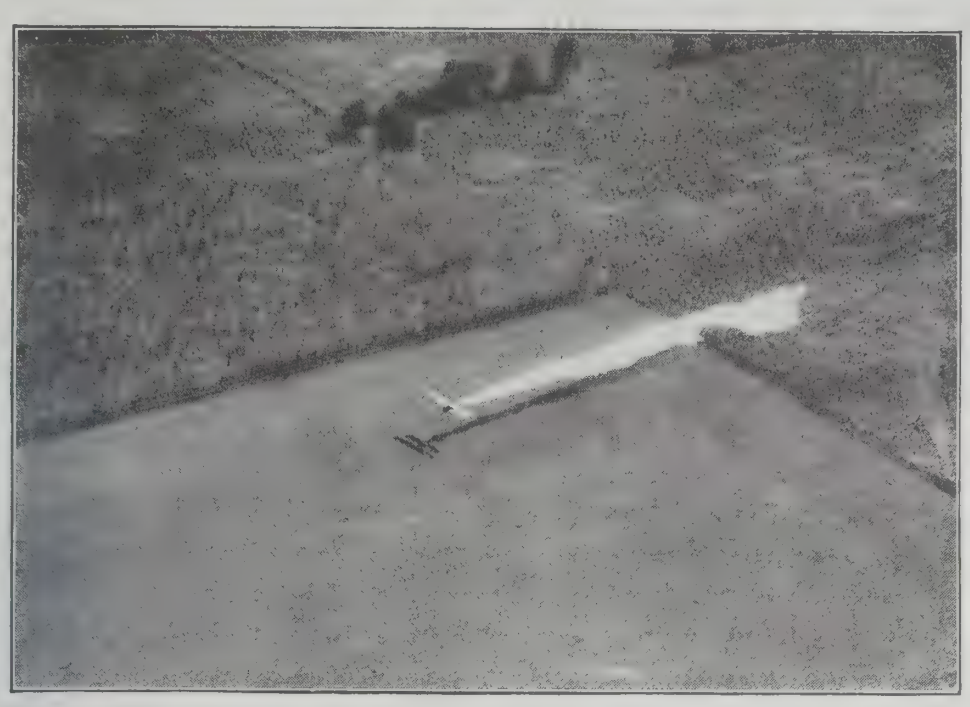
Both Kinds Are Preventable

MENTAL disorder and life-shock are preventable through self-knowledge and candor. If we admit our brutish, uncivilized and childish proclivities to ourselves instead of repressing them; if we drag them out of the dark into the daylight, we abort mental trouble. If we acknowledge our limitations and face the demands of the world with deeds rather than excuses or delusions, we are sane. We must not fool ourselves by seeking the rewards of life in phantasy instead of winning them from an obstinate world by actual effort.

The National Committee for Mental Hygiene makes the following suggestions as essential in protecting the mental health of children:

Give your child opportunity for a variety of wholesome activities and interests.

Train your child to work hard in some regular occupation suited to his ability and talents but to avoid fatigue by alteration of work and rest.



Train your child to strict obedience in a few important matters and let him alone in regard to unimportant things.

Avoid conditions that tend to produce overstrain or precocity. The special business of a young child is to grow and play with other children.

Protect your child from shocks. Do not frighten him yourself nor let other people do so.

Take the advice of a competent person concerning the peculiar, sensitive or nervous child to correct a possibly bad inheritance by proper education and environment.

Using the Airplane to Destroy Insect Pests

Airplane spreading insecticide over a grove in Ohio. Photo taken from another airplane.

HOW much advanced has become the various phases of human activity to which the airplane has been associated, is attested by an experiment in Ohio a short time ago. A farmer near Dayton had been busy trying to devise a plan for saving from destructive insects thousands of trees in a grove which he owns. He labored hard to achieve his purpose without success. He was able to spray the lower limbs of the trees, but the tops, where much of the harm was being done, remained virtually untouched by his efforts. The state agricultural experiment station at Wooster, Ohio, was communicated with. Officials of that institution suggested that the use of the airplane might result in putting a stop to the damage being done to the trees. At any rate, it was worth the effort. The McCook Experimental Post at Dayton, where all engineering work with government airplanes is carried on, was communicated with and fell in with the plan. The result was that Lieutenant John MacCready volunteered to help the farmer. He took one of the experimental airplanes from the field, attached a box of insect powder beneath the body of the ship, flew over the grove and distributed, through a process of sifting, 100 pounds of insecticide. The device operated on the principle of a flour sifter and it worked perfectly.

The McCook Field has announced its willingness to cooperate with all farmers who may be needing an agency to relieve them of insects. The airplane, it is said, fits in admirably with this new process. Lieutenant MacCready had to fly low and skim over the tops of the trees, but his skill enabled him to do this without more than ordinary danger to himself.

Estimating Your Vocabulary

THE average adult is supposed to have a vocabulary of 11,700 words and the superior adult one containing 13,500 words or more. Experiments made by specialists at various universities have shown that by using a test, like the one given below, requiring only a half hour or less, the vocabulary of a person may be gauged so accurately that the margin of error does not exceed five per cent.

The method used to arrive at this result is that known as sampling. The last word in every sixth column of a dictionary containing 18,000 words is selected for the test. A list of 100 such words is compiled. A dictionary with 18,000 words is presumed to contain only the common terms in ordinary use.

The person taking the test is asked to tell the meaning of the words in this list. The number of correct answers multiplied by 180 indicates the size of his vocabulary. If he possesses average intelligence he should be able to give correct definitions of 65 out of the 100 and his total vocabulary would equal 65 times 180, or 11,700.

If you stood by the side of a leading highway and for half a day tabulated the different makes of automobiles that passed, you would be able to estimate pretty closely the number of machines of each make in the county. You would exclude machines with license plates from other states. You would express your results in terms of percentages, then get figures from the license board on the total number of machines registered and then you could compute your final figures on the assumption that the distribution of makes in the county as a whole would be the same as on the stretch of road you had under observation.

Professor Lewis Terman's vocabulary test is the one most widely used. We give only every other one of his 100 words, so you will multiply your correct answers by 360 and thus obtain the figure showing the size of your vocabulary. You are not expected to give a precise dictionary definition, but merely to show that you know the meaning of a word with reasonable accuracy.

Americanizing the Art of Dancing

By JOHN B. WALLACE

DANCING as a branch of the fine arts is of comparative recent origin in America. Strictly speaking, we have no national dance, as we have no national music. The nearest approach to it is the primitive war dance of the American Indian. We also have adopted and elaborated the buck and wing and shuffle of the Negro.

Yet America is a dancing nation. Imbued with the vigor and health that comes from plenty of good food and sanitary environment, it is but natural that we should turn to the dance to work off our surplus energy. It is that superabundance of physical energy that has made the one-step and the two-step so popular with our younger generation. As they become older, however, they turn to the waltz, the one ballroom dance of perfect rhythm.

While dancing as a form of amusement always has been popular in America little attention has been paid to it as an art. There has been for a number of decades, it is true, sporadic attempts to popularize so-called esthetic dancing, but it was not until recently, especially since the revolution in Russia, that this form of physical expression has come into vogue.

Now dancing is even taught in our public schools. Not only has society adopted it, but it has percolated down to our humblest citizens, thus insuring its permanence as an institution and not a mere fad.

While credit for the recent popularity of what might be called artistic dancing—to distinguish it from the ballroom type—must be given largely to the influx of Russian dancers, who undoubtedly are of all nations the greatest masters of this art, yet it is doubtful if the teaching is left entirely in their hands the art can long survive in America. This is because the art of the Russians, while wonderful in technique and expression, is essentially an appeal to the senses. America, a melting pot of all the nations of the earth, is yet predominantly Anglo-Saxon in its ideals. While composed in the aggregate of neither prudes nor Puritans, it fails to react enthusiastically to the manifestations of either the Slavic or Latin temperaments.

Therefore to preserve this wonderful art until we can evolve a distinctive American dance, it must be shorn largely of its physical appeal, for which must be substituted appeal to the mind. Love, the foundation of all arts, as it is basis of all human efforts, provides the motivity for the dance. It cannot be eliminated without destroying the appeal of the dance. But it can be spiritualized. Instead of depicting what predominates in Russian and other European dances there can be portrayed the love of home, of mother, of brother, the love of man for man, the love of God.

It is along these lines that Marian Virginia Shipp, who in private life is Mrs. E. C. Howard, of Los Angeles, is working.

Miss Shipp is a Kentucky girl, who started out to be an illustrator and designer. While studying in New York she concluded that dancing offered a more alluring field. She studied the art under some of the best teachers in New York, including the famous Menzeli. She now has a large studio in Los Angeles, where she has under instruction many of the daughters of the society leaders of that city.

MARIAN VIRGINIA SHIPP

Every year she gives what she calls a dance-drama in one of the larger theaters of Los Angeles. These productions are entirely original with Miss Shipp, who not only arranges, composes and directs, but designs all the costumes and scenery. Miss Shipp, although she borrows a little from all schools of dancing, may yet be said to have created a distinct school of her own. All her productions are distinguished by marked originality.

So successful has she been in developing talent that many of her pupils have received flattering offers to enter the professional ranks.

Her dances, while beautiful in their grace and grouping, make a distinct appeal to the mentality of the audience rather than to the senses. Her pupils are taught that the body is but the instrument for the expression of the idea. In fact, the consciousness of physical being is taken from them so that in acting their parts in one of Miss Shipp's dance-dramas they become literally identified with the idea which they are representing, just as a great actor becomes merged in the character he is playing.

Miss Shipp also has original views on the relation of the dance to the other arts.

"I am a believer," she says, "in but one art, and that is the unity of all arts in giving forth one great beautiful thought or idea of beauty and truth."

"I do not consider music greater than literature, nor sculpture greater than the pictorial arts, nor any of them worth more than dancing. Each and all these expressions are inspired by the Master Builder, and in proportion, as an artist or a group of artists combine their faculties for expression and seek to portray or to reflect life's perfect unity and beauty, does art become worth while."

Miss Shipp carries out this creed in her dance-dramas, in which music and design are given an equal place with dancing, combining the three to make one harmonious whole.

She believes that dancing should be used only where it is the natural medium of interpretation for an idea. In this she differs from the European school. Consequently an audience is not compelled in viewing her production to draw on its imagination to the lengths often carried to absurdity in Russian and French ballets.

Two years ago she engaged one of the largest theaters in Los Angeles to stage one of her productions. Not only did a group of Jewish stage hands annoy in every possible manner but when she came to settle the bill she found that they had charged for the services of 20 men for each rehearsal, although three men had actually done the work required. Miss Shipp has plenty of good American spunk and she refused to be gouged. As a result her productions have been boycotted in every theater in the city and she is compelled to stage them at a club, which is far too small for the productions she has planned.

Merging the Public School and the Hospital

Minneapolis Plan Serves as a Check on Tuberculosis

By JOHN M. WRIGHT

"PLEASE, doctor, can't you find something wrong with me?" questioned a boy in tears.

The test had been negative. He had been pronounced free of tuberculosis.

"Please, doctor, I want to stay," pleaded the boy.

The unusual request came from a pupil in Lymanhurst, a unique institution just opened in Minneapolis, which partakes of the functions of both school and hospital.

Dr. F. E. Harrington, commissioner of health in Minneapolis, explained that Lymanhurst is not a school, nor is it a hospital. It represents a new idea in the treatment of children with tubercular tendencies, and there isn't a word that will fit it. And so, in Minneapolis, the institution goes by the name of Lymanhurst —not Lymanhurst school, nor Lymanhurst hospital, but Lymanhurst.

Now, when a boy cries to stay in a hospital—or a school—you may conclude that it is something out of the ordinary. Indeed, the Minneapolis institution represents a departure in a good many ways.

Numerous cities have installed open-air schools, though even this improvement has not reached hundreds of cities and towns throughout the land. Frequently these schools house all anemic children taken from the regular schools. Some of these pupils may have tubercular tendencies, but others may have been retarded by other causes.

Nor has there been in the usual open-air school adequate means of treating children afflicted with tuberculosis. To Dr. Harrington and his associates in Minneapolis, a school didn't seem to fill the bill. Neither would an ordinary hospital do. When a child is placed in a hospital, he gets good physical treatment, perhaps, but no schooling. His body is improved, but the development of his mind more than likely is allowed to stop just at the period when it should be receiving the most encouragement.

Then, too, Dr. Harrington has found that there are a large number of children who are not actually ill, yet are infected with tuberculosis to the extent that they are dangerous to other pupils. To the profession, they are known as ambulatory, open lesion cases. Excluded from the schools, most of these boys and girls did not enter the state or county sanatoria. In fact, parents of many of the pupils saw no necessity for it. The children apparently were well.

"Last spring I excluded 118 pupils from the schools because they were infected sufficiently to be dangerous to others," said Dr. Harrington.

"Now, what did these children do? Why, in most instances, they remained at home.

"And putting the boy in the usual hospital, where there are no classes, wouldn't be any better so far as his mental development is concerned. We were convinced that we must protect the child in every way. We take him out of the regular schools, and it certainly wouldn't be right to shut him up in a hospital without a chance to get an education. If it is our duty to safeguard the health of the child, likewise we must prevent him from becoming a vagrant."

Hence, there came to be established in Minneapolis a hospital where boys and girls afflicted with tuberculosis may go to school, or a school where boys and girls may receive the best hospital treatment. It has X-ray rooms, therapeutic lamps, and all the finest equipment developed by medical science for the testing and treatment of tuberculosis. And it has also sleeping rooms, a kitchen, play rooms, a victrola, and all the adjuncts of the most up-to-date school.

No wonder these boys and girls hate to leave Lymanhurst. Consider a school where you are required to sleep for two hours a day, for instance. Or a school where you get ice cream for lunch, and where you are required to play. There are motor buses which call for children who live too far from the school to walk.

The public health organization in Minneapolis is novel in one respect. Dr. Harrington is at once commissioner of health and director of hygiene in the schools. As supervisor of Lymanhurst, he thus is working for two bosses, the welfare board and the school board. The two boards co-operate in running the institution. The department of education furnishes the teachers and provides for instruction costs, while the welfare board furnishes the nurses and doctors.

"We are going to examine every one of the 60,000 children in the Minneapolis schools," Dr. Harrington explained. "Few persons realize that tuberculosis infection is so prevalent. When you consider that 85 per cent of all children are infected with tuberculosis to some extent, the importance of dealing with the matter becomes strikingly apparent.

"Really, that is the function of Lymanhurst. We propose to fill the gap between the open-air school and the regular hospital. The open-air school possibly is all right for those only predisposed to tuberculosis, or from families with tuberculosis. The regular hospital is necessary for the serious cases. Our institution is both hospital and school. It is a new link in the chain.

"As we make this survey, we are going to take out those with infection enough to be dangerous to other pupils. I am sure there will be 200. The number may even reach 500. These children will go to Lymanhurst for six months or a year, returning to their regular schools as they are improved.

"As for the operation of this hospital-school, the daily program will be suggestive. When the child arrives in the morning, we give him a cup of hot milk.

"There is a recess at 10:15. Each child is given a half pint of milk. At 12 o'clock the children prepare for dinner, and at 12:30 eat a full meal, including soup, meat, vegetables, salad, and ice cream for dessert. Then the children go to the rest room and sleep for an hour or two. They really sleep, too. After their nap, they go back to classes for a bit. In the middle of the afternoon they have a bowl of broth or cereal, and another drink of milk before going home at 3:30.

"We have had 48 boys and girls in Lymanhurst during the summer. The institution was completed in June and we decided to open it to volunteer students in advance of the survey to be made following the opening of school in September. These 48 volunteered, and they had a picnic all summer.

"All but three of these children gained in weight. Here, too, is a significant thing—all but one were promoted to a higher grade in their school work. Now, these children had been excluded from the regular schools. Yet here at Lymanhurst, while being treated for tuberculosis, they passed their grades.

"We taught every grade from the first to the eighth. In another year I expect to add the high school classes.

"Many of these children never missed a day. Really, it was a marvel to see how they enjoyed it. We have 13 showers in the institution, and you couldn't keep the youngsters out of them. We have a victrola, too. You see, you have to amuse and entertain these boys and girls. It is more than teaching. Many of the youngsters tire easily at first, and so we have to do things to stimulate their interest and enthusiasm.

"Next summer, we are going to have a garden, and let the children work in it. That will mean more open air and less study, but it will be worth while."

Temperature of the children is taken daily. Their weight also is recorded every day. When the child enters the institution, X-ray pictures are taken, and, later, other pictures, to show his improvement. These are shown to parents, thus enlisting them in further efforts for the promotion of the health of the family.

Ten leading physicians of Minneapolis volunteer their services as a staff, and trained nurses have been provided, so that the children at Lymanhurst are constantly under the observation of specialists in the treatment of tuberculosis.

"The time to begin treating tuberculosis is when it is in its earliest stages," Dr. Harrington emphasized. "Many mothers think that their thin, anemic boy or girl is 'growing too fast,' or that the child has a bad cold or poor digestion. I have watched the school children, and it is my opinion that many of these cases are incipient tuberculosis. The time to stamp it out is in its earliest stages."

Above—Boys may look healthy enough to the casual observer, and still be tubercular. For instance, consider the lads in the picture. Perhaps you wouldn't guess it, but all have been under treatment for tuberculosis. Under the new plan in Minneapolis, Dr. Harrington plans to test every child in the public schools for tuberculosis.

Right—The Lymanhurst building, erected to serve both as school and hospital for Minneapolis children afflicted with tuberculosis.

A Rah-Rah Community Spirit—By E. J. BECK

COOPERSBURG, Pennsylvania, is populated by a Pennsylvania Dutch citizenry, an element not ordinarily thought of as effervescing with emotionalism. This community has official town colors, a town hymn, a town motto and a town slogan.

A local poet wrote the hymn and home talent furnished the motto and slogan. A contest was held to elicit literary competition along these lines, and a committee of judges selected the best contributions.

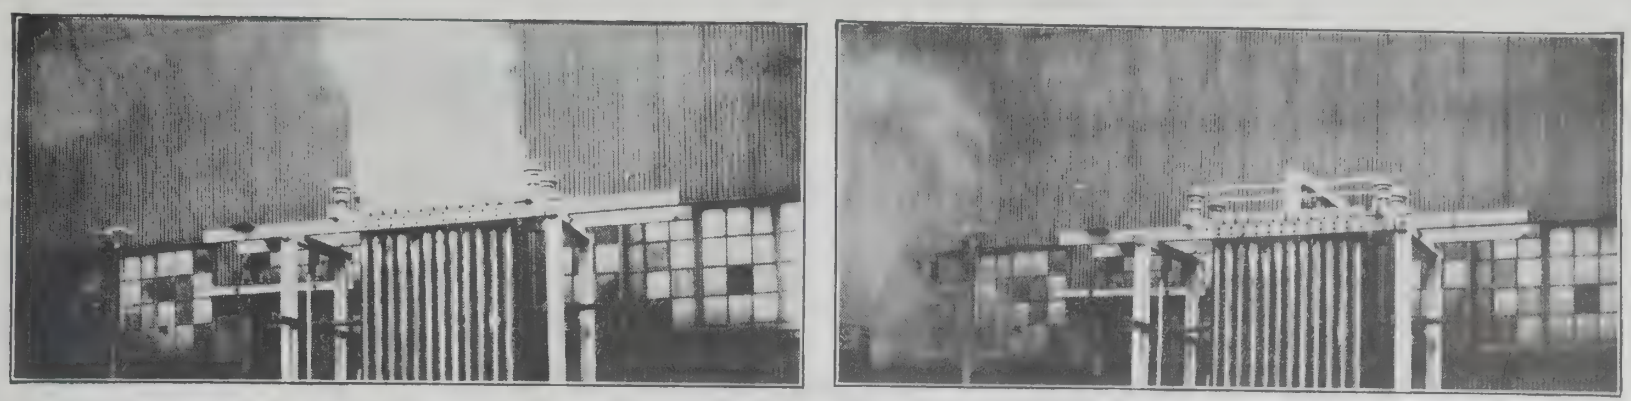
The town hymn is quoted herewith:

MY COOPERSBURG

My Coopersburg! Of thee
Home of my childhood's glee
Of thee I sing:
Haven of peaceful rest,
Village of all most blessed,
To every parting guest
Thy praises cling.

My native Coopersburg!
Dear, fostering, home-like burg!
Thy name I love;
I love thy rolling farms,
Thy quiet rural charms;
My heart with ardor warms
For thee I love.

Dear God we plead with thee,
Drive all adversity
Far from our town;
Long may her glory rise,
Her praises fill the skies;
Bless thou the town we prize,
Grant her renown.



No one can possibly mistake a University of California man for a Harvard man or a Cornellian for a product of Yale. Long residents in college towns even claim the ability to distinguish almost at sight the members of one fraternity from another by an indefinable something which is the product of group ideals and spirit.

One of the things that strikes a man driving through the country as he passes through village after village is their sameness. Why cannot a village exhibit a distinct individuality? Such an individuality would first be expressed in externals by the exploitation of the natural beauty of the location. Like the discriminating woman, the village should dress itself in the garb that sets off its inherent charm.

This landscape and architectural distinctiveness should then be accompanied by a psychological individuality. Why cannot the village have a morale, a spirit, a communal fervor analogous to that of the college? Local pride, historical traditions, the fond recollections of childhood, the sentimental associations rooted in the impressionable years, the typical American "boosting" propensity—all these emotional ingredients may be blended into a dynamic town spirit.

Why cannot the rah-rah impulse furnish the kinetic energy for civic progress? Let the village give up its fatuous dream of growing into a metropolis, the "10,000 by 1922" idea, and develop its present human, commercial and esthetic resources to the limit by intensive cultivation.

Let Smithville, Ohio, come to represent something distinctive in the mind of every tourist who casually travels through it; let its buildings, its natural beauties, and its human elements combine to form an individualized social entity—a community with a personality—just as a college represents a distinctive composite of ivy-covered halls, a campus unlike any other and a body of special traditions and sentiments.

Left—Cottrell experimental apparatus in cement plant, with current off; right—Plant under identical conditions with the current on. Note all absence of smoke or dust fumes.

Turning Smoke Into Money

By ROBERT H. MOULTON

AMERICA sends millions "up in smoke" yearly because of the enormous waste in the fuel used by our industries. On the other hand, there is a man in Washington who has discovered how to turn smoke into money, and he is now busily engaged in teaching the rest of the country how to perform the same trick. He does this by means of devices which, through electrical precipitation, not only reclaim vast wealth from the smoke, dust and fumes of smelters, but at the same time redeem thousands of acres of near-by land. As a matter of fact, the curb which this man has put on the smoke and dust nuisance—his original aim—now actually bids fair to be, in some directions, the primary reason for the running of certain of our industries. The smoke wizard who has accomplished these remarkable things is Dr. Frederick G. Cottrell, chief of one of the government's greatest scientific agencies—the Bureau of Mines. Dr. Cottrell has many claims to the appreciation of his fellow scientists. He is a man who does things and says little. He is that rare thing, an American who cares little for either money or publicity. The clearest proof of the possession of the qualities of the true scientist that Dr. Cottrell has ever given, a demonstration deemed to be a model to be followed by those of his kind, came a decade ago, when he made a discovery of such practical value that it was obviously capable of being made to yield all the riches any man might desire. After having demonstrated its possibilities Dr. Cottrell gave it away. He consistently refused all offers to make a fortune out of his work, and when money began to pour in on him in spite of himself he promptly got his friends together, formed what is known as the "Research Corporation," and turned the financial stream into the corporation, with the provision that the funds were to be used to assist struggling scientists whose hardships he already knew. An ironclad agreement was made that all profits from his work go to the corporation and not to Dr. Cottrell himself.

Rich potash (in bags) reclaimed through dust precipitator at a cement plant.

DR. FREDERICK G. COTTRELL

The first big contribution of Dr. Cottrell to science was the electrical precipitation of particles of liquids and solids, or, in popular terms, the elimination of smoke and rescue of smoke constituents by a process of electricity. Undertaken at first to eliminate smoke as a nuisance, the process showed that the so-called smoke dust precipitated at big plants was worth in some cases more than the product being manufactured.

It was in 1906, while he was working as assistant professor of chemistry at the University of California, that the idea first came to Dr. Cottrell. California at that time was much annoyed over fumes from smelters. There were examples of it close to the university. The fumes were admittedly necessary to the running of the smelters, but were a nuisance to everyone within their radius. There was continued talk about it, but no one suggested a possible remedy, excepting to remove the smelters. Dr. Cottrell said little, but it was noticed that he began spending all his spare time in the laboratory. He worked whenever he got a chance during the day and far into the night. Finally he surprised his friends at the university by telling them that he had discovered an "electrical precipitation process" which would do away with the smoke.

In a general way his idea was to remove the suspended particles from the gases by the aid of electrical discharges. His process was to operate by passing the gases, carrying the suspended, finely divided particles, between two systems of electrodes, one of which was made to carry a negative electrical charge, while the other carried a positive charge.

The electrodes were to be charged by being connected with a source of high voltage electricity, consisting of a high voltage transformer for increasing the electric potential up to a working voltage of from 20,000 to 100,000 volts. A rectifier for changing alternating current into direct current and a switchboard were to provide the necessary control equipment. Dr. Cottrell figured that the suspended particles, while passing between the electrodes, would become electrically charged and would be driven into pipes by the forces of the electric field. The original laboratory experiments conducted by Dr. Cottrell were made with the apparatus shown in the accompanying photographs, which clearly show the effect of turning the electric current on and off in a precipitator in which sulphuric acid mist had been generated

Dr. Cottrell had no money at the time he perfected his invention. He was distinctly "hard up" in those days, but he was certain he could eliminate the smoke nuisance if given a chance. It happened about this time that at Riverdale, a town not far away, there was a huge cement factory, which had likewise become a nuisance in the community because the dust from it found its way into the blossoms of orange groves near by and interfered with the development of the fruit.

How dust from cement manufacture collects on vegetation and destroys life.

The orange growers took the matter into the courts and spent hundreds of thousands of dollars pressing and winning their cases. The company then tried the expedient of buying up the land at $1,000 an acre, but found it couldn't stand the pace. More than $1,000,000 had been spent by the company in litigation and still there was no relief in sight. In desperation the firm sent for Dr. Cottrell, the fame of whose experiments had reached it from the university.

Dr. Cottrell told the firm that he believed his process would solve its difficulty, but that it would cost a considerable amount of money to install it. He was told to go ahead and never mind the expense. The process was installed and it worked like a charm. It did away with the dust nuisance completely, and it was not necessary for the community to sacrifice either its cement plant or its oranges. The electrodes in the smoke stacks of the cement plant yielded every day 100 tons of minute particles which would otherwise have been spread out on the community. Although the plant had a capacity of 5,000 barrels of cement a day and business was good, Dr. Cottrell suggested that the concern might find it profitable to examine the dust which his process collected. The firm did so and found that it contained large quantities of potash, and potash is the basis of one of the most valuable fertilizers in the world. Since that time the company has manufactured chiefly potash, obtained from the smoke dust by the Cottrell process, and is only making cement as a by-product. Thus a new and profitable means of getting potash has been discovered. This is certainly a romantic development of modern industry, where an apparatus installed to save the life of the factory turns out to be the center of the operations, around which the entire plant is adjusted, the incidental profits being sufficient to make the former operation of the factory of secondary importance.

The success of the experiment at Riverdale attracted the attention of a smelter at Vallejo Junction, located a few miles from the former place, which was at that time the subject of injunction proceedings brought by the farmers of the surrounding country. Three separate stacks of the smelter contributed to the alleged nuisance, the most serious offender of the lot being one which handled the gases from the lead blast furnace and discharged several tons of lead fume daily into the air.

While this particular trouble was overcome by the installation of a bag house before work was begun with the electrical precipitators, there still remained a stack which, besides discharging the gases from the roasters, furnished dense white clouds, consisting chiefly of sulphuric acid, arsenic, and lead salts, and to which the bag house was not applicable because of the corrosive action of these gases on the bags. There was still another stack which carried the mists escaping from the pots of boiling sulphuric acid used in dissolving the silver out of the gold and silver alloy coming from the cupels. The electrical precipitators installed at this smelter by Dr. Cottrell proved eminently satisfactory and was the first commercially successful use of the method applied to this type of smelter. The precipitators have now been in regular daily operation for more than 12 years at a cost for labor attendance and repairs of less than $20 a month. As a matter of fact, the plant made enough bluestone to utilize all the weak acid recovered, so that the saving on the purchase of the latter paid for the entire cost of operating at least five times over.

While the solution of the coal smoke problem lies in better combustion, and while what is here needed is not so much a method of collecting smoke as one for preventing its original formation, Dr. Cottrell expresses the opinion that in some special cases, and probably for some time to come, precipitation methods may prove a stepping stone and a useful adjunct. As an example, he points to power plants which have a very high power demand for a short period during the day, as compared with the rest of the time. Under such conditions it is impracticable to prevent the production of a certain amount of black smoke during the high power period without providing a much larger furnace and boiler equipment than is required for the average load. The installation of precipitation apparatus would prove more economic than the addition of boilers and furnaces that would otherwise be required.

The waste in metallurgical smoke—which means gases, vapors, and fine dust—that issues from blast, smelting and roasting furnaces runs into hundreds of millions in money. To prevent that waste was really the problem to which Dr. Cottrell addressed himself.

It is thought Dr. Cottrell's device will be generally applied throughout industry in the near future, but none of the earnings will benefit Dr. Cottrell—the money will all go to aid other struggling scientists.

BRIEFLY TOLD

Three cowboys will make the trip from Yellowstone National Park to New York City on horseback without purchasing fresh horses. They are to dress in typical western style and expect to arrive in New York City on January 1.

The belt buckle of a Hessian soldier, who took part in the Revolutionary War, was discovered recently on the site of an old Revolutionary hut cantonment. This buckle is in a perfect state of preservation. It is of bronze, engraved with the monogram "F. F." surmounted by a crown with ermine tails below. Evidently the F. F. stands for Fuerst Frederick, the regiment of the Hessian army which was brought over to fight Washington's troops.

The U. S. S. Pecos is capable of supplying fuel oil to four vessels at the same time, while moving at sea. Two vessels can be bunkered from the stern and two from the sides.

Holland auctioneers start at a high figure and gradually reduce until a bid is received.

African children are taught to balance a calabash on their heads while learning to walk. Thus they learn their first duty in usefulness at an early age.

The remains of "John Daniel," the gorilla that recently died in America, are being studied by scientists. Casts of the head and face have been made, finger prints have been taken and the brain and body are being dissected by specialists.

An airplane flight to the North Pole will be attempted by an American aviator, who intends to start from Point Barrow, Alaska, and plans to reach the northwestern corner of Spitzbergen. From Spitzbergen he proposes to fly via Norway to England. Sufficient fuel will be carried for a 50-hour flight and if it is impossible to make landings on the polar ice the 1,800-mile flight will be made without descending.

One full-grown bull snake is capable of cleaning up all the gophers on an acre of alfalfa, according to the Kansas Agricultural College.

Crossbreeding of the woolly ox, or yak, of Asia with Galloway cattle is expected to produce ideal meat animals. Seven head of yak have been imported and the experiment will be carried on in Alaska, where the winter is too severe for ordinary cattle. The yak weighs about 1,100 pounds and has a coat of woolly hair three or four inches in length on the upper part of the body and longer hair on the neck, shoulders and underparts. The meat is similar to beef.

Out of every five marriages comes one divorce, according to statistics.

Rent profiteers are forbidden to charge higher rents in Buenos Aires than those in force before January 1, 1920. President Irigoyen recently signed and promulgated a new law to that effect.

San Francisco high school girls voted nine to one against silk stockings, fancy frocks, transparent dresses and pyramid hair dressing. Cotton stockings, middy blouses and wash dresses will be substituted.

Toys 1,900 years old were recently unearthed in the tomb of a little girl in Rome. In the child's hand was a coin of Tiberius—the ferryman's fee for crossing to the other side. A small doll and doll's silver candlestick also were found. The girl had dressed the dolls.

Silk woven from spider webs by the French in Madagascar is beautiful and strong. Female spiders, about three inches long, spin from 300 to 400 yards of web every day. The thread spun by this spider is as strong, in proportion to its size, as the finest steel cable.

Sectional steel bridges, which were constructed during the war for use in Europe, have been turned over by the War Department to the Department of Agriculture, which has placed many of them on roadways in the National Forests, where they are used to span streams.

The percentage of illiteracy in Japan is lower than that of the United States.

The ordinary house fly makes journeys of five to six miles in 24 hours, according to experiments conducted by the Bureau of Entomology.

Traffic at Columbus Circle, New York City, was blocked 15 minutes recently, when motorists and pedestrians halted on their way home to rescue a squirrel which had wandered from a park to Broadway.

A new test for gold has been perfected by the United States Bureau of Standards. Electric sparks jumping from one bar of gold to another are photographed through a diffraction grating revealing minute quantities of baser metals. The highest grade of the San Francisco mint, known as "1000 fine gold," is but 99.997 pure.

A telephone connecting pedestrians on the sidewalk to demonstrators in show windows is a new way of attracting attention to advertised goods. The demonstrator has a telephone on a table in the show window with connections outside under a sign reading: "Answer the phone!" A button rings the outside telephone and the pedestrian usually responds and the demonstrator endeavors to interest him further.

Supersensitive instruments in the United States Bureau of Standards at Washington are of such delicacy and precision that the mere presence of the operator's body is sufficient to generate heat enough to disturb the machine's accuracy. Another instrument shows the loss of weight due to reduction of the earth's atmosphere when two pieces of metal are weighed one on another instead of being weighed side by side.

Poverty has hit the historic Latin Quarter of Paris. Where 12,000 students attended the lectures at the Sorbonne in 1919, only 7,000 names were entered last year. Unfavorable rates of exchange force many students to go to German universities instead of to France.

Salmon, marked four years ago at the hatchery, have returned to the hatchery on the Columbia River to spawn.

Bismarck's chef is now a janitor in the Capitol at Washington.

Nine-tenths of the annual mortality from lightning occurs in the rural districts and towns and villages of 2,500 inhabitants or less.

The right of a man to eat in his shirt sleeves in a public dining hall has been upheld by an Oklahoma court.

Contending that the average police officer is as alert and intelligent as the average citizen and that he continuously carries his life in his hands while doing his duty in protecting the public, the city police forces of New Jersey cities have issued an organized protest against the manner in which police officers, sheriffs, constables and judges are caricatured on the screen, holding that it brings the institutions of law into ridicule and has a bad effect on the public mind.

An orchestra plays every afternoon from 4 until 6 in a large barber shop in New York City.

Detective schools have been established by the Department of Justice. The curriculum includes study of such technicalities as the laws of search and arrest, rudiments of evidence, rights of citizens and preparation of cases for prosecution.

A twentieth century Robinson Crusoe has been found living on an island in the Caroline group. He was shipwrecked in 1901 and was the only white man living there. He was befriended and admitted to the tribe of a native chief, who ruled the island.

Military tanks were used in England to check heath fires this summer. All efforts to check heath fire flames near Aldershot failed until a detachment of tanks, with water and chemicals, cleared the way for the fire fighters who followed through.

"War does not pay," so declares Pierre S. du Pont, chairman of the E. I. du Pont de Nemours & Company. This maker of munitions says that his company has lost, as a result of the war through taxation, accrued profits of 20 years.

Discarded hats constitute a real problem for hotels of New York. One chain of hotels rounded up more than 3,000 discarded hats, collected from rooms where they had been left by patrons. The discarded hats will be sent to Central Europe for distribution.

Uncle Sam's School for "Leathernecks"

Marine Corps Institute Is Training Fighters In the Arts of Peace While in the Service

By H. O. BISHOP

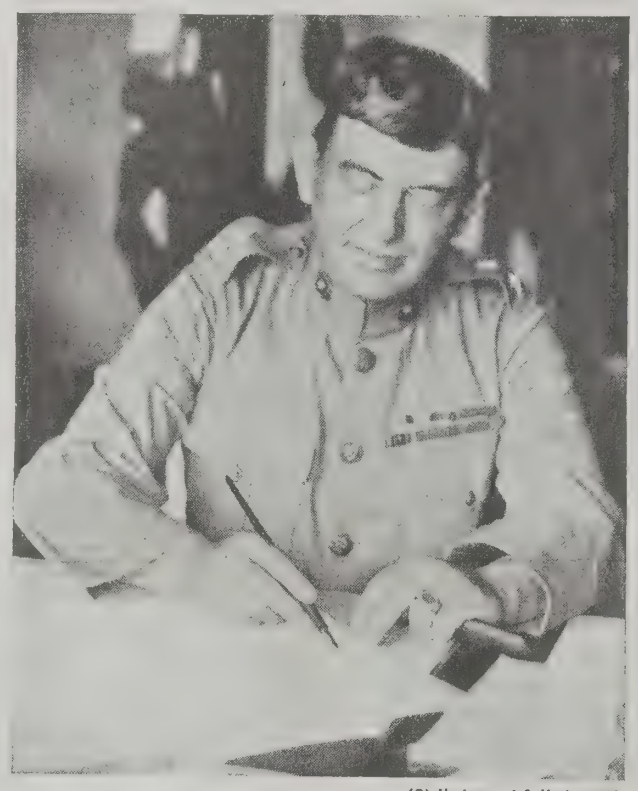
ISN'T it a bit surprising to hear that young men are eagerly enlisting in the United States Marine Corps chiefly to obtain an education?

The twin courses of scrapping and schooling in the famous "Leatherneck" branch of Uncle Sam's fighting forces are a new combination that is making a big hit with the boys of the country.

More than 4,000 of the 20,000 young men comprising the Marine Corps have already enrolled as members of the government correspondence school, which is known as the Marine Corps Institute. It is believed that it will be only a year or two until practically every man in this great organization will be putting in his spare time learning some trade or profession that will fit him for an important place on the stage of life after finishing his term of enlistment in the service.

"Now, let me get this proposition straight," earnestly questioned a young man who was talking to a recruiting officer in a large eastern city. "Do I understand that if I enlist in the Marines I will not only get $30 a month, with my board and clothes thrown in, but also a chance to get the kind of an education that will mean something to me after I get through with my three years' enlistment?" On being assured that such was the case, the young man said: "Give me a pen and show me where to sign; I'll study those books so hard there won't be anything left of them when I get through."

The work of the Marine Corps Instituted is conducted through world-wide correspondence. The headquarters are in the marine barracks, near the navy yard in Washington, D. C.



It requires a faculty of about 100 members to conduct this institute. They are composed of the brightest and best educated officers and men of the Marine Corps. Their work consists in the preparation and grading of papers and keeping in touch with their pupils no matter how remotely they may be stationed from Washington. Marines on battleships headed for Hong Kong, Rio Janerio, Honolulu, Norway, Spain, the Island of Yap, or any other part of the world, are busily engaged with their lessons, getting them ready to mail back to the institute at the first landing. They also know that the instructors of the institute are keeping in close touch with their movements and that a new lesson will be awaiting them at each place where anchor is dropped. Of course, when Marines happen to be stationed on shore duty for many months at a time the schooling problems can be pursued more rapidly.

The instructors at the institute are themselves graduates of a well-known correspondence school, they having been required to take a course in some certain line that they are now teaching the boys. In addition to the institute in Washington, there is an instructor at each marine post in the United States, whose duty is to help the young men with their lessons, provided they need it. And on each ship at sea there is some officer who has been designated to help the young men the same way. In fact, it would seem that Uncle Sam is doing all he can to fit these boys for civilian life after their discharge from the service.

The government has been giving Marines the various courses for a year and a half now, and some have already graduated. A recommendation from the commandant accompanies each graduation certificate. In addition to the government's institute, each man enlisting in the Marines is entitled to a free correspondence school course, in the same school from which the officers of the institute graduated. Many have availed themselves of this opportunity, but it would appear that the government school is the most popular, judging from the number of enrollments. Both the Marine Institute and the free courses at the private correspondence school are an outgrowth of the original vocational training school, which was established at Quantico, Virginia.

The instructors at the Marine Institute are examining and passing on about 400 examination papers sent in by the students each week, which indicates that the boys out on the deep or at scattered posts are keeping them quite busy.

There are many colleges throughout the country with enrollments of from 1,000 to 1,500 that are considered big schools. One will get a better idea of the bigness of the Marine Corps Institute by comparing its enrollment of 4,000 pupils with the number of students attending the following nationally known colleges and universities: Princeton, 1,850; Harvard, 5,273; Yale, 3,326; Tulane, 2,908; Vassar, 1,106; Wellesley, 1,529; Lehigh, 1,136; Leland Stanford, 2,450; University of Texas, 4,478; Dartmouth, 1,738; Brown, 2,105; University of Michigan, 10,000; University of Florida, 812; University of Montana, 1,296.

(C) Underwood & Underwood

MAJOR GENERAL JOHN A. LEJEUNE,

Commandant of the United States Marine Corps.

The range of subjects taken up by these ambitious young fighters is surprising and of unusual interest. The favorite study, strange to say, is automobile mechanics. It is a trifle odd to think of boys on a battleship out in the middle of the ocean burning the midnight bulbs in an effort to learn all about the construction and repairing of automobiles. Nevertheless more than 700 of the boys are pursuing that line of study.

Electrical engineering is a favorite with the boys, too. Almost 400 of them are eagerly fitting themselves ultimately to follow in the footsteps of the Edisons, Teslas and Alexander Graham Bells.

It would seem that a lack of leg work is proving somewhat irksome to some of the men. Something like 200 of the Marines are studying salesmanship, with a view of getting jobs as traveling salesmen after their careers on the briny deep are a closed incident of their lives. Wise young men are they! What could be more desirable than legging it from one big buying customer to another after several years on a ship.

The jokes about the easy life and big incomes of plumbers evidently have reached the ears of some of the boys. Half a hundred of them are diligently learning all about that important vocation.

Poultry raising is engrossing the attention of 31, while general farming is holding the interest of 82 others.

From battleships to mining and metallurgy is quite a jump, but 32 Marines are delving into the mysteries of those important occupations.

Five are going in for concrete engineering, five for structural engineering and 118 for civil engineering.

The idea of launching into the commercial world seems to be very popular. Among the boys who are taking courses in the business departments of the institute, 15 are studying banking; 54, commercial law; 44, business management; 339, commerce; 123, higher accounting; 8, railroad accounting; 33, traffic management; 177, civil service, and 579, general English.

In the industrial schools, 32 want to be chemists; 10, druggists; 6, refrigeration experts; 54, telephony and telegraphy experts, and 88, gas engine mechanics.

Seventy boys are devoting every spare minute of their time to the study of architecture, while 118 are learning drafting.

Some day in the future 16 musket toters will be converted into that number of high-class cooks. Domestic science has been chosen by these boys as the most fascinating thing in the curriculum of the institute.

Three lone Marines are dead sure that nothing in the world could be more interesting than learning how to trim windows in artistic fashion. Nineteen are ambitious to perch on high ladders and paint bright-hued signs on the sides of big buildings. Illustrating and designing is holding the deep interest of 82. Show card writing is being studied by 16.

The mastering of foreign languages is another very popular course. Almost 200 students are endeavoring to equip themselves for life work in foreign countries.

Hundreds of letters have been received by the officers of the institute from students and parents expressing their appreciation of the work that is being done. Here is one from the mother of a boy whose home is in the farming section of the Middle West:

"It is with much pleasure I write you these few lines to let you know we are indeed very proud to receive word of our boy's studies and work. I am proud my boy is getting along so nicely in the Soil Improvement Course. This is the first time he has ever been away from home and you can realize how lonesome we are and how we appreciate your efforts in giving him an education along lines that will aid him greatly when he returns home."

The following is typical of letters received from students:

"I am very much pleased with the course I am taking and cannot speak highly enough of the service the instructors of the institute are giving me in advancing me in my course. Every little thing that I get wrong is marked on my returned paper and I can then go to the book and look the question up and find out just where I was in error. I think the course in general is a fine thing and an opportunity that no one in the Marine Corps should let slip past, as one or two hours' study will certainly help a fellow. The textbooks are well prepared for study and easy to master when you get right down to it and study. I am getting a great deal of benefit from the course and sincerely appreciate all that the school has done for me."

Every officer of the Marine Corps from Major General John A. Lejeune, commandant of the corps, right on down the line, is highly enthusiastic about the work of the institute and never overlooks an opportunity to boost or improve it.

The Railroads May Want a Strike

THE strike, as the last hope of perplexed mismanagers, is forcing itself more vividly than ever before upon American attention.

The threatened railroad strike becomes intelligible only when viewed in this light. The railroads are frankly up against it. Mismanagement has brought them to such a plight that they are unprofitable even for Wall Street to gamble in. Mismanagement has so completely ruined even itself in the process, that with an emergency staring it in the face, it cannot think of a single way of escape, it cannot thrust itself into the collar for a forward pull. The only contribution which railroad management has made, aided and abetted by certain dangerous friends of President Harding, is that wages should be cut and rates lowered. This stupid, asinine, suicidal proposal is made in the face of the demonstrated fact that the salvation of the roads is in lower rates and possibly higher wages—a fact which members of the old order will never understand.

What are the railroad managers to do? They are either to repent and be saved, that is, admit that they have been wrong all the time, and proceed to learn how to do right; or they are to throw the railroad system into such a chaos that a startled country will approve even so foolish a plan as to give $500,000,000 for the postponement of the railways' day of judgment.

The managers have shown no disposition to repent; there are signs which would indicate that they would not consider a general strike as a calamity—to them!

The railroads have proposed that they cut their men's wages twice before they cut their freight tariffs even once!

That is confession, but it is more—it is incitement to strike. When the railroads proposed it, they knew it was an incitement to strike. And knowing that, they began to figure on what a strike would do. And having figured, they were just as well satisfied if the strike should come. Why? Because it would make the public willing that the wrong thing should be done for the sake of a temporary relief.

It is confession that the railroad managers have no resource left except to take out of the men's pay envelopes what they have not been able to take out of their own managerial brains. It is management that makes a railroad pay, not holding back the laborer's hire. The railroads are a necessity; there is more than enough business for them all; they have just passed through a period of unprecedented opportunities to make money, and all that they can show for it is an indisposition to meet their pay rolls.

As if pay rolls are the real burden that is bearing the railroads down! The way railroads are run now, they would be just as badly off if they paid no wages at all. The trouble is not in the pay roll. But tampering with the pay roll may precipitate a condition—a strike—from which they may hope much.

Most strikes have purposes behind them that neither the public nor the strikers ever see. Most strikes are strategic moves in a great battle that is far removed from the apparent matters at issue.

The threatened railroad strike—which by the time this is printed may be called or may be off—is plainly one of that class of strikes. And being that, it will be a boomerang upon the heads of those who placed their hope in it.

If President Harding could only be lifted out of the financial fog of the old way of doing things, so that he could be left free to tell the railroad gentlemen of this country just what the trouble is—that the trouble is in them, and in their way of doing things, and in the silly system which puts service last—he would be striking out a new path of reform.

It is not compromise that is needed, but drastic regeneration. And a strike is not necessary to that. Indeed, it is possible to organize a strike for the very purpose of postponing that.

Started, But Not Finished

MOTION picture producers—the alien kind, alien in origin and soul—are on the run. But it may only be a strategic retreat. Running is, for them, safety; they should be caught and safely bound to prevent them returning to their filthy trade. The American public is notorious for being easily satisfied with any alarm its expression of opinion causes. More than alarm among the enemy is needed. More than censorship bills which chloroform the conscience of the public. More than speeches and editorials that tell the tardy truth. A thorough cleaning out of the foul nest and all its brood is needed, else the old evil will swarm back again.

Without modifying in the least the previously expressed opinion that the newspapers of this country were culpable in waiting until the Arbuckle explosion before they told the truth they very well knew, it is extremely gratifying to observe the honest lengths to which numerous editors have gone to tell the truth now. In Los Angeles the expressions are very sharp. When Bishop Leonard, at the University Methodist Church, spoke out as plainly about the facts of movie control as ever THE DEARBORN INDEPENDENT did, his statements were printed.

There is no doubt that these gentry who have controlled the movies and given it its moral tone, are in for it. That is the meaning of Charlie Chaplin's hurried journey to Europe. In spite of Mr. Brisbane's ecstacy over the meeting of the banker Sassoon and the clown Chaplin in Paris, this was the meaning of that meeting. It was not two successful Hebrews meeting in mutual admiration committee, it was two financiers consulting about the ruin with which the movie business was threatened by Christian opinion.

In the stupid efforts at defense made by the movie controllers, there are daily illustrations of the truth that "Whom the gods would destroy they first make mad," William C. De Mille, whom a million posters urge us to consider as a great figure, has made a spectacle of himself on the plea of "artistic freedom." Even Gouverneur Morris, the novelist, who should have had more respect for his name, has been rung in as a propagandist, and an article signed by him has gone the round of editors. And what is his plea?—This: Before jumping on Arbuckle, you ought to know something about the woman who was the victim, and of the drunken woman who alleges the crime was committed. That from Gouverneur Morris! How account for it? Simply that the alien movie controllers have gained control of the popular writers, too, by screening their works at fabulous fees.

The *Morning Oregonian* remarks that it is strange that the film-makers do not understand better the public psychology. It is not at all strange, no more so than that the cannibal does not easily understand our aversion to his choice fare. But it is unquestionably strange that the newspapers have not begun to understand the psychology of the film-producers.

Indeed, there is where the work must begin. Newspapers have asked the film-makers to understand the public. The shorter cut, the more effective method, is to let the public understand the psychology of the film-makers, who they are, whence they come, and why they think as they do. It is this very thing that the film-makers ask to be protected from—public knowledge of themselves.

Before we can understand the pictures, we must understand the men who make them. Before we can understand the lecherous riot that marks so large a part of professional movie life, we must understand the atmosphere that is created to make such riotous living possible, and who creates it.

One promising result of the whole mess is the emergence into public notice of religious and denominational journals which seem ablest of all to voice the growing moral determination of the people. The *Literary Digest* of October 15 prints liberal excerpts from these, and there are many more that might be cited. With editorial independence and vision on those papers, the so-called "secular" press might be moved by envy, if not by example, to give in the future more heed to the welfare of their readers, and not lavish all their anxious care upon their advertisers.

Inertia Blocks the Way

SUMMING up a keen survey of mankind down through the ages and from Kamchatka to Peru, a famous philosopher once said that history showed that the force of greatest moment in human affairs has been the force of inertia. That is, he explained, mere inert mental indolence had blocked and delayed human progress and advance more than all the active opposition of opponents of reform.

This saying recurs with particular force at a moment when we are forced to realize that, despite all the war-time predictions that the great upheaval would usher in a new era, the era of optimistic and achieving youth, the mossbacks are pretty much everywhere still occupying the seats of the mighty. Not the Young Man but the "Elder Statesmen," the Bourbons, the Stand-Patters, the Old Guard, are running this government.

No sincere student of political history can fail to be impressed with the fact that, despite the almost heroic impulses toward revolt within the lines of both the Republican and the Democratic parties that marked the first decade of this century, little lasting impression has been made in the half-century gone on the massive inertia of American public life.

The same thing is true in varying measure in the fields of trade and industry (especially in transportation) banking and finance, education and organized religion. On all sides, those who were inspired by the war to look forward and attempt to go forward to better things find themselves impeded and blocked by unlooked for obstacles placed in the path of progress by that Old Guard which dies but never surrenders—or changes.

What are we going to do about it? We who cherish and believe in the glad, daring and beneficent Spirit of Youth? If we have any sense we will know that just rising on our hind legs and howling, or tearing around, calling names and smashing the crockery will only make matters worse. Perhaps we will find a practical hint in the lines of Charlotte Perkins Gilman, whom W. D. Howells called "America's greatest satirist." In a poem called "The Obstacle," she tells of a traveler on a mountain road, who found the upward and onward way blocked by a "great big hulking Obstacle" who sat squarely across the path. After the Obstacle had been politely petitioned, reasoned with, berated, cussed and threatened to no avail, a sudden inspiration came to the traveler and taking a deep breath, he

> "Walked right through that Obstacle
> As if he were not there!"

Nothing the Matter With Kansas

IT IS rather cheering in the midst of so much talk of general depression in business to learn that Kansas is more than holding her own. We are told on the authority of the Public Utilities Commission of that state that, during August last, Kansas products shipped out of the home territory filled 8,505 more freight cars than were filled in the same month of 1918, when the peak of war-time prosperity was reached. August shipments this year filled 19,508 more cars than did those of August last year.

This looks very much as if Kansans had taken to heart the sting in the tail of William Allen White's famous editorial, "What's the Matter With Kansas?" which appeared in his Emporia *Gazette* nearly a generation ago.

Steel Prices

STEEL rails are being maintained at the war price of $47 a ton, despite wholesale reductions in wages and remarkable economies effected in the manufacture of steel through new processes and machinery. High prices for steel mean high prices for railroad transportation, high costs for building and high costs for nearly everything.

According to John R. Dunlop, editor of *Industrial Management,* American steel plants are now so perfectly equipped mechanically that they can produce steel cheaper than ever before—cheaper than anywhere else in the world. From mining the ore to shipping the finished product, machinery does 90 per cent of the work—the few highly paid skilled mechanics who operate the machinery being paid what the economists call the wages of superintendence.

It will be remembered that the war profits in steel were the subject of a public protest made by Walter R. Hines, when director of railroads. He put up a brave fight to save the railroads and the government tens of millions of dollars yearly on their enormous purchases of steel.

Now that the roads are back in the hands of private owners, may we look forward to hearing them protest against these war prices as vigorously as did Hines?

Mr. Ford's Page

THERE is a conference coming on at Washington, which some people speak of as a "disarmament conference," as if the purpose were to disarm the governments, but which the governments themselves describe as a conference upon a proposal for the "limitation of armaments," which means little or nothing, as anyone will see upon analysis. There is now a very energetic effort being made to convince the people that they ought not to expect too much from it.

It is very doubtful if the people are committing the error of expecting too much; most of them are not expecting anything, so far as the conference is concerned. Conferences have lost their power either to awe or stir the people. Words, words, words, woven of weakness and deception, no longer cast their spell upon the world.

And yet it is not too much to say that the real thing which the peace-loving people of the world are seeking, would not come so soon if this conference were not held. One may go even further and say that the peace we seek would not come so soon if this conference were not a failure. There are certain hurdles to be jumped on the way of progress, and futile conferences are often one type of them.

What is important is not what this conference does, but what the people shall continue to think. He is little less than a fool who ties his faith to a few gray-haired men, steeped in the deceits of diplomacy, sitting about a table anywhere in the world. But he is not quite a fool who ties to the constant desire of humanity's heart.

And so there are two dangers to be guarded against: one is that of expecting too much; the other is that of becoming absolutely indifferent.

You won't expect too much after Versailles. Nobody will. The meeting, it is true, will be held at Washington, and there is no doubt whatever that honest American thinking will have a better show at Washington than it had at Versailles, and doubtless our representatives will prove pretty shrewd men when it comes to the ancient European game of cornering the honest man or the honest policy. But for all that, most of the old players are coming, and they will attempt to make it the old game, probably in this instance befogging the issue with matters the public are not discussing at all.

But that is not the important point. More important than anything the conference may do or fail to do, is the faith of the people in what is right. It is very important what ground we have for our faith. If we pin it to a person, he may fail us; better pin it to a principle. If we pin it to a conference, it may sell us out; better pin it to the truth of the future.

Versailles has made millions of cynics. Why? Because they founded their faith on Versailles. But has Versailles made any truth less true? Has it made any lie less false? What failed at Versailles?—only the men who had in their hands the highest climax of opportunity which the Old Era had ever offered. That's all. Truth is so much the gainer, because now the world knows what error can and will do.

Cynicism and indifferentism are the penalties we pay for shortness of vision. Men who through conviction follow principle, are not so easily thrown off the track. Given enough cynicism and indifferentism in the world, and the battle of the evil diplomats is already won in a place where they never hoped to win it, namely, in the hearts of the people.

Now, there is a way of regarding all this, which saves ourselves and preserves the cause. It is worth while to know what it is, and to adopt it.

In every advance which good principle makes in the world, there is always a series of experiences where the thing which we think is to be *the* thing, turns out to be only one of its ingredients. The boy at school learns to add a line of figures, and when he comes to the top of the line he feels that he has arrived. But life takes all of that, blots out the very memory of it, and builds the essence of the action and experience into his life. After a time he wins a prize, and again he thinks he has arrived at the top, but that too is ground down into its elements, and is built into him.

Now, there must be conferences. And conferences must fail. The Old Order must meet in conclave on the New Order, and condemn it. *Must*—at least it always happens so. It seems that one of the elements which contribute to the downfall of the Old Order is to allow it to retain its show of authority by permitting it to sit in judgment on the New Order, and passing its condemnation. And when in robes and titles and with every form of man-worship the Old Order meets, hears the plea of the more righteous future, and denies it—off-stage somewhere, in the wings with Destiny, one hears ominous creaking, as of a curtain about to descend forever.

The Old Order condemns itself in condemning the New, and the condemnation of the Old is necessary to the arrival of the New.

The conference is necessary; let it be held; but if it fail, it is only another hurdle safely crossed on the way to the goal. It must needs be; it is on the eternal schedule. One more thing out of the way when Versailles flared up and faded out. Another thing out of the way when the Washington conference shall be a matter of the past. And perhaps other such occurrences yet in the future. But this is the truth about them all—they must needs come to *pass*, and then comes *the thing itself*.

How men needlessly pain themselves by staking their whole soul on the outcome of an election, or the progress of an organization, or the success of this little plan or that. Why, every great reform has won through lost elections. Every great advance has been made over the ruins of organizations that were formed to foster it. Every success that ever came, has come amid the broken plans that were expected to bring it in. And even in the history of wars, lost battles have been an important element in the ultimate victory.

The greatest good the Washington conference can do, of course, is to adopt and secure the operation of a means toward disarmament of the governments. The people are disarmed already.

But the greatest harm the Washington conference can do cannot be done without our consent, and that is, to destroy men's confidence in the possibility of ever attaining a better state in the world. The conference cannot do that to us, unless we permit it. That is within our own power. Better judgment tells us to take the view that if the conference fails, it only advertises anew that the Old Order is insufficient to take up the advancement of the New Order, and is sealing its own departure.

In these days, when so many people cling so piteously to the old departing forms of things, and fear the New Era that is coming in, it is a very valuable thing to have the Old Era personified in a conference, advertising itself that it cannot do what ought to be done.

Sufficient advertisement of the inadequacy of the Old Era to the requirements of the New is all that is needed to make the timid people willing to part with the Old.

The conference, however, may be a new kind of conference. It may contain both the New and the Old, and we may see the departing order in its last conflict, and the New Order in its first attack. Who can tell? Nevertheless, let us keep the faith. Our faith is in something profounder than conferences.

MANY people expect the Washington conference to fail. The Government itself, by insisting that the object is "limitation" and not "disarmament" is practically telling us not to expect too much. What if the conference does fail? Nothing is lost! Indeed, much is gained! It is one more world-wide advertisement of the inability of the Old Order to meet the requirements of the New Order. Wars are won through battles lost. Reforms are carried through elections that failed to carry. Pin your faith to the Principle, not to any particular Plan of getting it. Success breaks up the best of plans. If the Washington conference is not the way, it is certainly not the end. Don't build your faith on anything that any group of men can manipulate.

The Origin of Habits of the Mind

By WILLIAM ATHERTON DU PUY

"HOW is it," I asked Dr. William A. White, the government psychologist, "that women indulge in the use of the first person singular more than do men?"

"This comes about," he replied, "because woman's position in the world inclines her more strongly toward becoming an 'exhibitionist' than man's does him. The rôle that woman has played through the ages has been more or less that of displaying her charms and getting on by that display. She has won her way on a purely personal basis. Her chief business has been to get a mate and her success has depended on how she looked and how she deported herself. In such a campaign the small detail of those things which she has said and done have been of importance. She has come instinctively to talk of those small matters. In unconsciously advertising herself, she has become an exhibitionist.

"Man's life activities do not keep him so much in the show window. He becomes absorbed in his business, in the job on which he works, in the gratification of his desires. These usually do not call on him to be an exhibitionist. Many men, however, instinctively tend to show themselves off and instinctively talk in the first person singular. They assume an attitude and take great pains to live up to it."

"Is there not a close connection," I asked, "between this tendency and lying?"

"Certain varieties of liars," said Dr. White, "are exhibitionists. A man may tell stories of his own daring deeds to win the approval of members of the opposite sex. In doing this he is following the same psychology that a woman follows when she talks of herself. The liar is very likely to be a weak individual, a man who has lived few stories that are worth the telling. In his attempts to justify himself to others and particularly to himself, he begins telling fantastic stories. Finally, he becomes a victim of what we call *pseudo logia fantastica*. In his imagination he performs heroic acts, dispenses largess.

"The more common or garden variety of liars, however, are persons who are incompetent and who falsify to hide that incompetency. A man fails on a job and tells a lie to excuse that failing; he makes a mistake and lies to cover it up. Lying is always an evidence of weakness or inefficiency. The individual whose record is not sufficient to sustain him is driven to lying to bolster it up."

(C) Harris & Ewing

DR. W. A. WHITE,
Government Psychologist

Dr. White is superintendent of St. Elizabeth's Hospital, that great institution maintained near Washington by the Federal Government for the treatment of those men of its army and navy who suffer from idleness of the mind. For 20 years he has been coming to the front in America as one of the explorers in this field and today probably stands out as does no other man in America as a student of the operations of the human mind.

"I know a man," I said to Dr. White, "who constantly underestimates, depreciates himself. How did he get that way?"

"The chances are," said the psychologist, "that this man was the son of a very dominant, probably a very successful father. It is not generally appreciated that a titanic struggle often goes on between father and son—a struggle on which hinges the whole career of that son. It is an unequal combat, for the father occupies a position of natural dominance. The more forceful that father, the more successful he is, the more overwhelming his dominance over his son. The boy struggles through all his formative years to overcome that paternal dominance. If he fails to do so, as he probably will, he becomes this apologetic individual who depreciates himself. Success to him is almost impossible because it would upset his habitual attitude of self-depreciation.

"It has long been a subject of comment that successful fathers do not usually breed their kind. Their sons tend toward being weaklings. This is undoubtedly due to the fact that the father's success gave him too great an advantage over his son in the duel that was fought between them and the father won. This is unfortunate from the standpoint of this individual, this son of a rich man. It is, however, probably quite fortunate from the standpoint of the general public, because it results in a weak individual falling heir to a strong one and dissipating the wealth which he has amassed. If strong fathers bred strong sons it might come to pass in a few generations that all the money would be in the possession of a few."

"The habitual grouch," he went on, "is another type of man which we often encounter and who is likely to have laid the basis for his state of mind in his early youth. In his case, the parent probably was not merely dominant but abusive and cruel. The father probably beat the son, kept him so intimidated that his mentality soured. He got into the habit of having a depressed outlook. He came to take pride in the sourness of his conceptions of life and to accentuate them. They became a part of him. His name is Scrooge.

"Even more interesting psychologically is the individual who is almost a shut-in, but who has not quite given up the fight. This individual subconsciously realizes that he is beaten down, submerged, but he is still fighting in a half-hearted way against his fate. He forces himself out of his corner, he bustles around most busily, meddles in many things, assumes many interests. You have encountered him many times. He is the individual who takes you by the lapel, leads you aside and talks very earnestly with you on some subject of importance. He is the habitual buttonholer. He is the meddler-in where he has no business. He knows that he is beaten, but still makes a pretense that he is not."

"What is the origin of conceit?" I wanted to know.

"Conceit," said the doctor, "does not lie where it is currently supposed to exist. The man who appears to be most conceited may, as a matter of fact, be least conceited. The individual who puts up the boldest sort of front, who talks the loudest, who struts most vaingloriously, probably is not a conceited man at all. On the contrary, he has very strong weaknesses and he is aware of those weaknesses. The bold demeanor which he assumes is but a camouflage for the weaknesses of which he is aware.

"The quiet man who sits in company and says nothing, who remains an individual quite apart, is more conceited. This man regards himself as being above the small talk in which ordinary individuals indulge. He believes his qualities to be so superior, that he need in no way assert himself.

"Back of virtually every peculiarity of the human mind is the same explanation, an attempt at its own protection. There is, for example, the individual who goes about the world nursing always the idea that people do not treat him right, that there is a conspiracy against him. This is camouflage. It is his way of throwing out a smoke screen to disguise his own weaknesses. A shopkeeper who is failing in business, the old bookkeeper who can no longer keep his accounts straight, the chorus girl who is crowded out of her job—each is prone to raise the cry of persecution, of conspiracy, to gloss over failure. As a matter of fact, each has failed because of some natural defect, or inability.

"All this gets back to the real purpose of these psychological studies. Every individual has his strong points and his weak points. He is quite unlikely to know which are the corner stones on which the structure of his success may be built and which are the qualities that will cause his house to tumble. If he could come to know that certain acts of his, certain arts which he practices, are but covers for defects, that the defects may be brought to the light and cured, he would be greatly helped. He would not throw a carpet over a hole in the floor of his house to hide it. He would mend the floor.

"Yet this is exactly what he does with that vastly more important possession of his—the mind. It is coming to be realized that it may be possible for a man to have himself examined and diagnosed in such a way that he will come to know wherein he is weak and which are the facts it is advisable for him to turn to the front. He is finding that if there are splinters in his mind that are causing infection, it is the part of wisdom to remove them.

"In many of the industries today employers are studying the persons who work for them and determining the strong points and the weak points of those workers and are fitting them into tasks where they will serve best. These employers are finding it advisable to take the measure of the qualities of their workers and adjust them according to those qualities. The employer, himself, has not gone so far as yet to have a psycho-analysis made of his own character and to shape his career according to that analysis. This is a development that may be expected in the near future.

"There is, of course, the possibility of curing the defects that may exist in the mental attitude of all these people. The man who depreciates himself, the man who is a grouch, the man who is a pouter pigeon, the man who is a liar—each of these has a quirk in his mentality which should be straightened out. There should be psychopathic wards available for the treatment of persons suffering from mental maladjustments. It should be possible for an individual to go to one of these wards and get his intellectual carburetor so tinkered up that it will function properly.

"It has been shown that the uncovering of the exact cause of the quirk of the mind is very likely to cure it. The great need is the development of the psychopathic wards in our hospitals to straighten out the disrepair of human minds."

A Great Russian Dancer

DANCING, which has been aptly defined as "the poetry of motion," is the oldest of the arts. Like music it expresses emotions that cannot be translated into words. Just as the performer, in music, is able to instill the emotion he feels into the hearts of his auditors, so the dancer subtly conveys through another sense his emotional reactions. But the dancer must be skillful just as the musician must be competent.

The history of the dance has been traced back through the centuries to primitive man. Every race has a dance peculiar to itself, which often expresses its dominant traits. The dance is used to express every phase of human emotion. Among more primitive peoples their character often may be adduced from the national or tribal dance. In civilized countries this is more difficult. But the dances of a community may well serve as an indication of its stage of culture.

In the great civilized countries of Europe dancing has evolved from the rude folk dances of the ancients to the modern ballet. The Greeks were perhaps the first to originate what we call classical or esthetic dancing, although the art was not altogether unknown to the Egyptians, as the inscriptions upon their tombs denote.

Revolution Scattered Dancers

THE ballet, however, as a form of entertainment consisting solely of interpretative dancing or drama originated early in the seventeenth century in France. The French Revolution drove many of her greatest ballet masters out of the country and they fled to England, Spain, Italy and Russia. The latter country proved the most receptive to the idea of the modern ballet, although England and even Germany were liberal supporters of this form of entertainment.

These countries, however, furnished very little native talent, while Russians seemed to take naturally to dancing. There, in the great schools of Moscow and Petrograd, have been trained some of the greatest dancers in the world. And as the French Revolution caused her great dancers to emigrate to other countries, so the Russian Revolution has scattered her wonderful corps of ballet masters among other countries and many have come to the United States and South America. In these men lies our hope of building up the dance of America to a character befitting the greatest nation of modern times.

"The American youths of both sexes are physically and temperamentally fitted to become marvelous dancers," said Theodore Kosloff, one of the greatest of Russian dancers. "I have had schools in my native country, in France, England, Italy and Germany, and nowhere have I found the talent you have in this country. Only in England have I found the younger generation to rival yours physically. In temperament your young people, through the mixture of races from which they have evolved, combine the fire of the southern races with the poise of the North. From all races they have borrowed a little, and it is easy for them to enter into the spirit of whatever dance they are called upon to interpret."

Kosloff maintains two schools in the United States, one in New York and one in Los Angeles. He has founded them upon the principles of the Russian schools from which he graduated. The Russian Revolution was a costly affair for him. He had invested half a million dollars, his earnings in Paris and London, in apartment houses in Moscow, and these the Bolsheviks have confiscated.

His Eventful Life

KOSLOFF has led an eventful life. In search of material for new interpretative dances he has visited every country except Australia. He had some exciting adventures while studying the native tribal dances in Africa. He still bears the scars from injuries suffered in a leap from a two-story building in Arabia. A friend had smuggled him to the roof to witness an Arabian wedding dance, which is forbidden to foreigners. Kosloff narrowly escaped with his life when he was discovered.

Kosloff is rather small and of seemingly slight build. One seeing him in his street clothes would never suspect the wonderful muscular development and marvelous agility of this Russian athlete. Those who are prone to sneer at dancing as being effeminate would speedily change their minds if they came to grips with this bundle of muscular energy who is equally at home in the ring or upon the wrestling mat.

Kosloff is not only a dancer and an athlete but he is an artist of more than ordinary ability. Some of his paintings have been exhibited at the Royal Academy at London. His talent for sketching and drawing would have brought him fame in that field if he had chosen it instead of dancing. He is also a gifted musician.

Speaking, as he does, a dozen languages and with a thorough knowledge of the sciences, Kosloff is indeed a man of culture.

The graduate of one of the Russian dancing schools is much further advanced than our high school graduates and has the additional advantage that he or she is ready to step out in the world and command a large salary. Kosloff, upon graduation, danced for five years in the great Mariansky theater in Petrograd, then went to the Paris Grand Opera, the London Coliseum and was one of the stars in the Russian ballet in New York. He has earned nearly a million dollars from his dancing alone.

Spending a Morning With George Moore

By CHARLES HENRY MELTZER

GEORGE MOORE.

AT THE office of a well-known London publisher, not long ago, I met a tall, unusual, rather slouchy man. He looked at me in silence for a while. I looked at him. Then suddenly we recognized each other. "George Moore, I think?" said I. It was George Moore. But since I had last seen him, he had aged. His long, limp, sad mustache had once been golden. Now, like his hair, it was as white as snow. And, with increasing age, he had put on a certain dignity. He had the same old careless tricks of dress and carriage. But he had mellowed in all sorts of subtle ways. His voice was gentler and more pleasant than of yore, though I should flatter if I said that it was musical.

We chatted for a time of vanished days, of wrangles we had had concerning Ibsen, and of a morning spent together close to Paris, when, on the way to a forlorn suburban cemetery, George Moore had outlined to me a projected novel. I still recall the impression this had made on me, and how incongruous it had seemed to discuss mummers and their wives in a grim mourning coach.

Before we parted we had one more wrangle, but when I turned to go, he asked me to call on him.

His Drab Surroundings

AT THE appointed hour, 11 o'clock, one Sunday, I knocked at a door in Ebury street. It is a street not far from a huge London terminus; like many other cheerless London thoroughfares; dull, drab, depressing. Old houses of brown brick, with formal entrances, stretched endlessly away on either side. From time to time a motor car rolled by, a "bobby," all in black, strode on his beat, a group of sober children stared and grinned at me, and went back to some sober game of play. Itinerant peddlers bawled their cry, "Fresh strawberries." A wagon here and there blocked the way. Why any writer should have gone to such a spot—how any writer could create in such surroundings—heaven only knows. But there at least one author makes his home. And there he has invented books and plays. George Moore's house stands out clearly from its neighbors; for its five narrow stories have just been repainted white.

The novelist was waiting to greet me. His manner was at first a little stiff. It was a mixture of dejection and embarrassment, yet not uncordial. In other days, in Paris and in London, I had been often struck by George Moore's want of ease and poise. Humanity had always seemed to puzzle him and make him awkward. His face had lines in it which told of strain. His voice was veiled, and tired. Not bored, but tired.

"You wish to interview me, don't you?" he began. "I don't mind interviews. I draw the line at one thing only. I will say nothing of contemporary authors."

The room in which we sat was not inspiring. The chairs were mostly covered with ugly red stuffs, which clashed with the green drapery on an oval table. An inlaid desk, which showed no sign of work, stood near one wall, and facing it I saw on the mantelpiece a clock and a few ornaments. Above the desk a landscape and two portraits. And at my back a dark and cheerless inner room.

Chooses the Easiest Way

WHEN he began to speak, at first, as it seemed, reluctantly, his arms and hands—distinguished, languid hands—were used to emphasize his words. At times a spark of feeling warmed his eyes. But as a rule, no matter what his words might be (and they were often startling), they gave the impression of being curiously detached. As I listened to his merciless iconoclasms and disturbing paradoxes, in fancy I went back to my green and salad days, when, with the man before me and his comrades, I had seen something of the Arcady called Barbizon. Those were the days when George Moore, still a fledgling, was known only by his early "Flowers of Passion." It was a book of rather imitative poems, inspired by Baudelaire and Swinburne. Unmoral and decadent, though quite clever. The first effort of a man who frankly admitted to his friends that he was unable to discriminate between right and wrong.

Even then he had been groping after truth, seeing the facts of life more clearly than their moral. He used to wander to and fro, as he does now, with a queer air of being mystified by the world. He seemed bewildered by the conventions and hypocrisies which hedged him in. He was sure of little, he professed no creed. But, when in doubt, he chose the easiest way. Nor was this strange. For he had had a bitter youth, and, very possibly, life owed him all he snatched from it. He sipped the honey from all sorts of flowers. Yet, though he may have found some joy in life, he always looked detached and far from happy.

All men, they say, suggest some bird or beast. Well, Moore has always been linked in my mind with sheep—or rams. There is something sheep-like in his face and in his voice. But there also is just a hint of femininity in the swelling lines of his tall, clumsy figure. Yet he is a masculine and unshrinking in his outlook on the universal scheme, and he has surely had his full share of romance.

I wish I could convey at least a notion of the tone in which George Moore replied to my first formal question. I had asked him what he thought of English literature.

"We are going back to the dark Middle Ages. There is no literature now in England, and there will be none. The English novel? I will not discuss the living. But, in the past, I know of no good English novelist. Fielding? I'd like to read you a few passages from an essay which I wrote some time ago about that author and 'Tom Jones.' It was printed in the *Fortnightly Review,* as an imaginary talk with Mr. Gosse."

He had warmed. Not much. But he had warmed a bit. And, as he picked up the *Review* and read what he had said of Fielding, "Tom Jones," "America," and the other works which we have all been taught to admire were torn to shreds.

Squire Western? A crude, lumpish, vulgar lout. So obvious that he really had no art value. Sophia and the rest? Trite, shallow things. No life in them. No life at all. He challenged Fielding's truth and Fielding's style. He would not hear of his having any claim to genius. How could a writer really be a genius when he cared neither for the outer truth of nature nor for the inner truth of souls?

Calls English Novels "Hack Work"

"DEFOE? I have discussed him, too, with Gosse. He was a hack. To be sure, he gave us one most able work. Up to a point I can admire his 'Robinson Crusoe.' Defoe does give one facts, good, concrete facts. And these appeal to average English minds. 'Moll Flanders?' I have dipped into that story. But how could one describe it as a masterpiece? Like all the novels in the English tongue, it is mere hack work. The English novelists of the past were all commercial. Their achievements were the outcome of mere bargaining between publishers and authors."

I mentioned Thackeray and Dickens and George Eliot. I entreated mercy for some other cherished writers. But, with a gesture of the hand, a ruthless phrase, George Moore consigned them all to black oblivion. Dickens? Too silly to be treated seriously. Thackeray? Only Smollett dished up for the drawing-room.

There was no anger in the phrases which fell limply from the speaker's lips. Nor did they seem to him outrageous, wild, absurd. They were the sayings of a man who had thought deeply about books and authors, and found them barren, without interest—trite and trivial.

The Brontes? How preposterous was "Jane Eyre"; how unimportant, though romantic, "Wuthering Heights." One author only seemed to him worth while—Jane Austen, in her "Sense and Sensibility." The English novelists cared nothing for sincerity. Or so he said, "they wrote their books for money, just for vulgar money."

"The English put their genius into poetry. They have produced a few great poets—but not novelists."

This hard judgment was a shock. I asked him if the increased cost of publishing would not be bad for England?

"Bad? Not at all." The idea appeared to charm him. The less most people read, perhaps, the better. It might help if men deserted books for nature. They might learn more, and in a sense become more literary, by watching fields and hills, and dropping novels.

And so they might. But George Moore goes on writing. And, what is more, somehow, he gets his stories published. Not always on the old and usual plan, for some of them are now printed by subscription.

"I found out long ago," he commented, "that I must not expect sales of 50,000 or 60,000 copies of my books."

In a recent contribution to a mazagine, he has reverted to his first love, to verse. Strong, Gallic verse, erotic, unabashed. Not of the kind that one could set before nice women. But what are right and wrong? And what is truth? George Moore has never really found the answers to those conundrums.

Forgets Debt to French Writers

I HAVE more than hinted now that he is not a moralist. He is not immoral, either, but—well, just unmoral. His early poems—he has lived them down—scorned the proprieties. His "Esther Waters," too, (it is now being advertised as the greatest of all English novels) could surely not be called a moral work. Nor was the "Germinie Lacerteux" of the Goncourts highly moral. It was from "Germinie Lacerteux" George Moore drew his inspirations for his own book. Read both the novels and you will agree with me. But though "Germinie Lacerteux" prompted his "Esther Waters," he has forgotten what he owes the two De Goncourts.

"C'est si menu, menu!" "It's all so thin, so thin," said he.

Menu, menu! Well, Jules and Edmond both died long ago. They had been treated rather badly many times. By Zola, quite as scurvily as by Moore. It was from the two brothers' marvelous studies, "Mme. Gervaisais" and "Une Page d'Amour," that Zola borrowed more than one of his neurotic women. Edmond reminded me of this himself one day in his famous "Grenier"—that "Grenier," which for years had been the meeting place of Zola, Flaubert, Daudet and the rest.

Moore is hard on Flaubert, too. "More perspiration than inspiration," he once said of him. He saw the effort which had given us "Mme. Bovary" and "Salambo," but was not able, as he said, to see the genius. He glided swiftly over Zola (whom he thought well of when he wrote "A Mummer's Wife." He ignored Daudet and De Maupassant and Loti. Only in Balzac could he discern the essential qualities of the great novelist.

What were those qualities? The "Flow torrential of deep wisdom and deep knowledge, the analysis of souls and their environments, profound psychology." He would not own that, in the essence, even Balzac was a romantic writer, the creator of the fascinating characters whom, later, he analyzed. The women Balzac drew were first inventions of his mighty mind. The living women rearranged themselves to suit his women.

He Bows to Balzac

BALZAC, our George Moore worships and bows down to. He also has some liking for Turgeniev.

The impression he conveyed, by his wholesale damning of all other authors, was that the world so far has given us only two great glorious novelists. The first was Balzac. As for the second. Well, of course, he did not name him.

He let me into several of his secrets. How did he write? Why, he dictated first. When he had done that, he revised, rewrote, improved.

He had not yet given up his hope of turning out a few more plays. He had published what he thought was a good comedy—remade, as he reminded me, from a much shorter play. It had appeared this year in three parts, in the *English Review,* under the title of "The Coming of Gabrielle." What chiefly occupied him at the

(Concluded on page 15)

Pro-Jewish Scout In the Daily Newspapers

Norman Hapgood, Erstwhile Writer on the Jewish Question, Is Now in the Press as Special Pleader for Jewish Leaders

"'NO MORE articles,' I said to myself a few weeks ago, 'about the Jews. Their problems are interesting, but they are in such a state just now that discussion will do more harm than good.'"

The writer is Norman Hapgood, writing for a Hearst syndicate service which is carried daily by many American newspapers.

Following the above quoted paragraph, which was printed in the papers of August 24, was the usual article, pro-Jewish, very thin as regards material, most palpable propaganda. And then more articles followed, and still more, until in the newspapers of October 1, Mr. Hapgood gave notice of a letter protesting against the personal abuse with which he had liberally sprinkled his articles, *and that letter was from a Jew!*

The letter of protest ended this way: "The last part of your name is good. Think it over. I am a Jew."

And Hapgood rejoins: "Well, I am not, but I am pro-Jew."

The Jewish letter of protest is not at all surprising. The Jewish people have become utterly sick and tired of those ebullient "defenders" who elaborately praise the Jews for the sake of Jewish applause. And it is becoming the conviction of the Jewish people that they would better trust those who are candid enough in their friendship to tell them the truth about themselves. Of this there is evidence on every hand. The Jews understand honest criticism and appreciate it; they also understand flattery and discount it. They were sore at first and vindictive, and some are still so; they were incited to enmity and folly by their leaders, and some are still incited; but the truth is making its way, that there is no enmity in truth, that "faithful are the wounds of a friend."

THE DEARBORN INDEPENDENT also has received letters concerning Mr. Hapgood, most of them being requests for information concerning his race. Although you will hear occasionally in New York that he is a Jew, it is probably true that he is not. His word may be taken without reserve on that point. There are also points of circumstantial evidence that he is not a Jew: his work is too thin and apologetic. It lacks the virility found in Jewish work of the same type. It is too often suggestive of pose. Besides, it utterly lacks the treasures, if not of wisdom then of texture, which mark the writings of a student. Offhand, one would say that Hapgood is a reader, but not a student. What he reads is pretty likely to come to the surface of his writings, so that in perusing a given article it is not at all difficult to trace what Hapgood's reading had recently been.

Hapgood Once Had a Vision of Candor

MR. HAPGOOD is of special interest with reference to THE DEARBORN INDEPENDENT'S series of Jewish studies, because there was a time when Norman Hapgood wrote more on the Jewish Question in the United States than any non-Jew had ever before attempted. Mr. Hapgood was a sort of pioneer in this field, as far as the public press is concerned. In fact, Mr. Hapgood once faced the opportunity to do this country a service, but he flinched, and he failed. He is now working for Hearst, the man on whose name and works he used to pour his most deadly editorial acid.

Norman Hapgood was editor of *Collier's Weekly* from 1903 to 1912, during which time he did excellent work. The fact that it consisted mostly in attacking non-Jews need not detract from its usefulness. The Jewish idea which debauches business must be blasted out of non-Jews as well as Jews. From 1913 to 1916 he was editor of *Harper's Weekly,* which publication proving unfortunate was merged with the New York *Independent,* which has since been merged with the *Weekly Review,* among the controllers of which is Louis Marshall, president of the American Jewish Committee, and Mortimer L. Schiff. After the disappearance of *Harper's* from the field, Hapgood went into government work, presumably under the direction of, or in some association with, George Creel. From February to December, 1919, he was envoy extraordinary and minister plenipotentiary to Denmark, representing the Wilson Administration. The Senate never confirmed his appointment. And now he appears before the public again as "Universal Service Staff Correspondent," with constant attacks on the study of the Jewish Question as being conducted by THE DEARBORN INDEPENDENT, and constant support of Zionism in particular, and in general all things Jewish.

Mr. Hapgood is a witness to the fact that the Jewish Question exists. He was not long settled in the editorship of *Harper's* before he gave evidence of being deeply impressed by it. If one may essay to read another's motive and purpose, one would say this: Once upon a time, Norman Hapgood had a vision of the good that would result to American society by a straight aboveboard discussion of the Jewish Question and also the question of religious prejudice in the United States. It was a daring thought for any editor to harbor, especially for the editor of *Harper's.* The very announcement in that weekly that the word Jew was to be used, that the terms Protestant and Catholic were to be used in candid articles, gave promise of a new appearance of frankness in American journalism. It seems to have been Mr. Hapgood's purpose to bring these questions into the air and sunlight, rescue them from the atmosphere of whispering and suspicion, and talk them over man-to-man fashion.

VOLUME two of this series of Jewish Studies entitled "Jewish Activities in the United States," being the second volume of "The International Jew," twenty-two articles, 256 pages will be sent to any address at the cost of printing and mailing, which is 25 cents.

But He Was Afraid to Give Offense

THE work, of course, did not come to much. Mr. Hapgood wanted to tickle with a feather while he worked with his scalpel, and no remedial major operations are performed that way. He was always in the attitude of apologizing for his facts. He kept anxiously glancing over his shoulder to see if anyone was taking offense, and as a result he committed the greatest offense of all, he was unfaithful to his venture.

The fact is, Hapgood was so "thick" with the Jews that he did not dare be the kind of friend that would antagonize them for their good. He knew far too many in a way that it is better for a writing man not to know any. Hapgood had a vision of what might be done, but he did not do it.

In his editorship of *Harper's,* Mr. Hapgood started off boldly on the path of reform, employing George Creel to write several articles against the entrenched evils of society. Gentiles, interested in the manufacture of patent medicines, were one of these evils. If these Gentiles happened to belong to a Christian church, it made a much juicier article. Billy Sunday was another of the evils attacked, it being charged that he was hauled from industrial center to industrial center to take the people's minds off wages and make them think of God—the bills being paid by the men who would otherwise have to pay increased wages. Tammany Hall was attacked, too, but never a word of the Jewish control of Tammany, never the name of a single Jew belonging to it. There were articles also on the motion picture censorship, but not a word of the Jewish control of the movie industry. An article on "What is the Matter With Baseball?" failed to give the real answer. It was the good old game of fighting the air, shooting into the sky, while the persons at the helm of the evils attacked went right on exploiting, corrupting and raking in the profits.

To Say "Jew" Was His Daring Plan

BEGINNING with the issue of January 23, 1916, *Harper's* began to speak about Jews. (That issue, incidentally, contains a photograph of a crowd of Jews hurrahing for Bouck White who rebelled against the Christian church by starting "an Anarchist Church.") The first article that appears on this subject is "Religion for the Jew," by Arthur H. Gleason. It is a Kehillah-inspired article. That is, it boosts the then proposed new Jewish system of education undertaken by the Kehillah. It was outspoken enough, however, to refer to the rabbi's schools of New York as the "five hundred holes where 15,000 boys are huddled around over-worked street peddlers with a smattering of rabbinical lore." Even that would have been seditious without Kehillah sanction.

In *Harper's* for August 7, 1915, Mr. Hapgood himself writes an article on "Big Jews and Little," in the course of which he indicates quite plainly that he knows the charges brought against Jews and that he believes there is some reason for it. We quote him:

"We accused the Jew of bad manners, of overacquisitiveness, of commercial dishonorableness, of ruining peasants wherever he went, of vulgarizing life and drama, of white slavery and prostitution . . . . And we conceive of a mighty political and commercial (especially banking) conspiracy, with a vast information bureau, having its malign influence on every move upon the international board . . . .

"Is there no reason for the persistence of this Jew-baiting? Most national pastimes are shorter-lived and less diffused. Frankly, there is a reason."

And then he goes on to discuss the "big" Jew and the "little" Jew, the "big" Jew being the Jewish leader against whom Mr. Hapgood brings the true charge—"He made moral ghettos for his fellow-Jew."

With these bare gleams of showing fact through to the bone, he desists, and drifts away into inane compliment and praise, returning only once to mention "the moral disintegration of the young Jews, especially in the New York slums," and the rest is mere words.

In *Harper's* of August 14, 1915, Hapgood has another article on "The Soul of Zionism," of which he knows nothing more than is contained in the propagandist literature put out from the Zionist publicity officers in lower Fifth Avenue.

In the issue of August 21 he discusses "The Jew and This War," being an appeal for pity for the Jews, another glance at Zionism as a solution, possibly with intermarriage on the side for those who do not go to Palestine.

Then on November 13, Mr. Hapgood takes up the question "Do Americans Dislike Jews?" and does not do very creditable work in dealing with it. He gives the yearly Jewish immigrant arrivals from 1880 to 1913, without saying where he gets the figures, and without alluding to the fact that the Jewish lobby at Washington prevented the United States Government from compiling those same statistics. (See first article, "How Jews in the United States Conceal Their Strength," Volume II, Jewish Activities in the United States—a reprint of previous articles in this series.) He hazards the guess that Jewish immigration would go down after the war. He was wrong, of course. Jewish immigration went up so rapidly and so high that Congress felt it necessary to pass laws curtailing it.

Failing in Frankness, Becomes Impudent

IN THIS article Mr. Hapgood says: "As to the United States, the simple truth is that Americans do not deprive Jews of any rights, but that they do not on the whole like them, and do not therefore bring out their more ideal sides." That is, it is the Americans who are to blame for the Jew. This is a variation of the Jewish statement, "Every country has the Jews it deserves."

November 20 appears another Hapgood article, "Jews and Intermarriage," in which he has the effrontery to do what no student of the Jewish Question would think of doing, namely, propose intermarriage to the Jews. Hapgood never got beneath his reading in this matter; he indulges in mere clap-trap. It is the right of the Jews to remain separate in any way they choose; they may keep socially segregated, racially separate, religiously separate, linguistically separate, if they choose. None of these things is the cause of the charges against them. The charge is that, being separate, they have a foreign policy against the people among whom they live. If the Jewish people, casting off the false leaders who have ensnared and enslaved them, will live to the common good, and not exclusively for that Jewish type of good which spells enmity to others, then the problem is solved. It is the Jewish idea, the Talmud idea, the anti-Gentile, anti-Christian idea which must be got rid of. Then, even the overdeveloped commercial instinct of the Jews will become an asset of the common good, which it is not now. Mr. Hapgood, besides betraying a fear of facts, a cowardice in the face of conclusions, betrays in his discussion of intermarriage an unconscious and coarse discourtesy which reflects seriously upon his knowledge of the Jewish Question.

In the November 27 article, "The Future of the Jews in America," a reward should have been offered for Jew or non-Jew finding what it is about. One absolute proof of Hapgood's incapacity on the whole subject is embodied in his words: "and since the war broke up the Zionist movement in Europe"!! That is one of the pathetic things about the Jews' use of their "Gentile fronts"—they keep them in such ignorance of the facts, permit them to go before the curtain and spout their errors, and then let them take the consequences.

That, however, was not the end of Mr. Hapgood's obsession on the subject of the Jews. It seems that he could not keep his hands off it. Apparently he knew of

something that ought to be said, and he was always trying to say it by indirection, but somehow he could not pump up courage enough to get it squarely said. He was constantly muffling it with words and a patronizing attitude. It was nothing for him to charge the utmost ignorance, cruelty, narrowness and baseness against his own people, against the American people, but apparently he could not screw up even a mild reprimand for people who he must have known were in collusion and whose influence he could not have misunderstood.

So, the Jews come up again in the issue of January 8, 1916, in an article "The Case for Intermarriage" by Armand Schreiber. This article contains some forthright statements:

"Why are the Jews, after so many centuries, still persecuted? Let us be frank. Nobody seriously contends that anti-Semitism is religious intolerance; it is purely racial animosity. And when accounting for the racial animosity, it will never do to raise the finger of scorn and point out the Gentile as the only cause of our suffering. This would be but a very simple device of hiding our own guilt. Though I do not for one moment admit that the absurd charges of the anti-Semitic propaganda are true, yet I freely concede our guilt to the extent that living among Gentile nations, we, on the theory of being the chosen people, the Simon Pure people, have scrupulously kept up our isolation."

Always Running Down His Own Race

AND in the next week's issue (January 15) Hapgood himself opens up again a new series about the treatment of Jews in schools and colleges, the first article being "Jews and College Life," the second one (January 22) being "Schools, Colleges and Jews," and the third one (January 29) on "How Should Jews Be Treated?" He says very little, the following quotations being as near as he ever comes to his apparent dream of saying something that has rock-like substance and strength.

The first quotation will throw light on Mr. Hapgood's quality of prejudice: "The two great influences in the schools of New York are the Jews and the Catholics. The Jews desire only to have the places assigned according to examinations, but Catholic politicians and office-seekers have sought constantly to have them assigned arbitrarily, so as to allow personal choice." Here he lauds the Jew at the expense of the Catholic Christians.

He does recognize, however, without entering into an adequate defense or even a complete explanation of the fact, that certain schools do not encourage Jews to attend:

"In some of the small preparatory schools, and even in some of the colleges, steps are taken to limit the number of Jews admitted. Usually this does not mean entire exclusion. The school does not wish to take a definite anti-Semitic stand. It simply wishes to prevent itself from becoming a Jewish institution, as it would become if everything were competitive" (Here is Hapgood putting the American student a notch below the Jew again.) "There, it establishes a waiting list, even if the prospects are that for the coming season it will have too few students, rather than too many. By tactful use of the waiting list, it is able to have about three or four Jews in a hundred, instead of allowing the number to increase rapidly. In many cases, where this device is used, the result is that the few admitted are treated very largely without prejudice, since it is to a large extent true that the prejudice that does exist is not against the individual Jew but against the race."

A Man Who Told the Truth in Harper's

ON FEBRUARY 5, *Harper's* contains an article by Stanley Washburn on "America's Chance in Russia." Washburn is rather refreshing after the noncommittal stuff of Hapgood. He says what he has to say, and what he says is not something he has read in literature sent out by a Kehillah, it is the result of observation:

"The question of the Jews is a delicate one to handle, but the Russian treatment of the Jews in this war has been, all things considered, extremely lenient, and many measures looking toward the alleviation of the Jews in Russia are under way. When I say that the Russian treatment of the Jews has been lenient in this war, I am quite well aware that I shall be contradicted vehemently by many persons, for certainly the German press agents have not been slow to capitalize Jewish sentiment by piling up stories of alleged Jewish atrocities. I cannot, of course, prove a negative and state that there have been no excesses in regard to the Hebrews, but I can say this, that I have been, as correspondent of the London *Times*, with instructions to look out for this very aspect, in the theater of operations from October, 1914, to November 1, 1915, and in all of this time I have seen nothing to warrant any statements of Russian cruelty to the Jews nor have I received any evidence from any credible source to establish the truth of any such story. During these months I suppose that I have been in not less than one thousand villages in Russia, covering country all the way from the Bukovina to the Baltic, and barring the expulsion of Jews from the war zone, I have seen nothing whatever that can be considered as an outrage on the Jews . . . . I think it safe to say that the major portion of the Jews in Poland were pro-German in their sympathies, and that the greater portion of spies in Poland proved guilty, were Jews. Yet there has been at no time during the war in Russia any, save possibly isolated cases of which I have no information, general persecution of the Jews."

IN response to numerous inquiries: The testimony given by David S. Franks, the Jewish aid of Benedict Arnold, may be found in Volume 5 of "The Publications of the American Jewish Historical Society," published in 1897. Other important information concerning the Franks family is contained in Volumes 1, 3, 4, 6, 10, 11, 16, 18 and 20. Consult the Index which was published in 1914.

This was a bomb shell among people nourished on the thin Hapgood pap, and *Harper's* heard of it from its readers, for in an editorial for the February 26 issue, Mr. Hapgood refuses to let the discussion burst forth, but gives instead an appeal to send money to those same Jews of whom Mr. Washburn wrote.

The last utterance, until he took up the task of getting into the daily papers his attacks against THE DEARBORN INDEPENDENT, was in the Jewish college fraternity publication, the *Menorah Journal*. In the October, 1916, issue he writes a special article in which he addresses the Jews directly:

Taffy—And a Slap on the Wrist

"DURING most of my life my individual acquaintance with Jews has been fairly wide, but not nearly so wide as it has been in the last few years. . . . The ablest young publicist whom I know in this country, the man who has the widest grasp among the distinctly young men, is a Jew. The man who in the last few years, without conspicuous credit, has done the most careful and patient work to organize the forces of reform in New York, is a Jew. He among the distinctly young men who has made the highest impression in the law is a Jew. The man of my acquaintance among the very young with the widest historical knowledge is a Jew. The man who understands finance from the intellectual side best in New York is a Jew. The man who seems to me, over a long period of years, to have contributed the greatest number of reform ideas to the solution of economic problems, is a Jew."

That is the way all Gentile pro-Jews begin. And the Jews hate it. Read their books, their papers, their correspondence, and see how they detest it. The exceptional Jew (as far as publicity goes), the flashy Jew, the well-advertised Jew, is often too well known to his people, to render palatable the Hapgood sort of compliment.

When Hapgood, with a glimmer of his old ambition to say the truth, turns to serious things, he says:

"I need hardly explain that I do not think Jews ought to insist overmuch on their rights or nationality in a negative sense. They ought to be as much Jews as they can, but ought to be as little as possible of what is merely anti-Christian. For the Jews to try to get a song out of the public schools because it praises Jesus is natural but perhaps hardly wise. I admit that question, however, is an extremely complex and baffling one. Again, the Jews have naturally taken a great interest in this war, but in that case also they ought to choose as far as possible the more tolerant view. Too much hostility to Russia was shown, it seems to me, when some of their spokesmen were fighting over the wording of the Immigration Act. They seemed to be fighting not for a real gain, but simply to rub their political power in America into the Russian mind."

Knowing so much about the Jews, their anti-Christian activities, their intolerance of the Christian American majority, "their political power in America" which they have so grossly misused, Norman Hapgood is guilty of plain cowardice in starting out with sugary praise and ending with a sweet little slap on the wrist.

He knows too much to say so little, and to say that little so timidly.

Why Should They Use the Daily Press?

IT IS a question, how much right Mr. Hapgood and Mr. Hearst have to use Norman Hapgood's name to get American Jewish Committee stuff into the American newspapers. We shall not now discuss the part of the newspapers themselves in this, for at the present time too many American newspapers are caught in a vise; the cure is not in scolding them, but in liberating them.

Norman Hapgood, with all his boasted independence, is not free today to write a series on "What Is Really the Cause of the American People's New Scrutiny of the Jew." He is not free even to quote what the true Jewish leaders say, leaders such as Herzl and others who have been quoted at length in this series. He is free to say only what is pleasing to the New York Jews, who for the most part are not Jews at all, and who are a curse to their people. He can please these New York leaders only by praising the Jews and attacking all who speak plainly about the facts of the Jewish Question. Even to discuss it at all is a mistake, in Hapgood's judgment. This is in implicit obedience to the Jewish decree that discussion of Jews as Jews must be prevented at any cost. That Hapgood accepts that view in the main is indicated in the quotation with which this article begins.

This is Hapgood's weakness as a writer on the Jewish Question—he never crosses the boundary line of Jewish opinion, he is saturated in it.

It is indeed sad to contrast and contemplate the might-have-been and the reality, in Hapgood's case. Once he seemed to see clearly marked the path by which plain-speaking could have brought a more wholesome atmosphere into our national thinking. But what "the fear of the Jews" dampened in him, the lure of Hearst has quenched. Hapgood flinched, therefore he failed.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages, respectively, sent to any address upon receipt of 25 cents in stamps for each volume.

JEWISH WORLD NOTES

The Jewish press writers are feeling very sore over the success of the Polish Republic in placing a $250,000,000 loan in this country. The worst of it is that Jewish money lenders, despite persistent Jewish attempt to defeat the effort to finance the struggling new nation and so punish it for alleged "pogroms," seem to have succumbed to the temptation to participate in the profits of the loan. "Emes" in "Modern View" commenting on the report that the Guggenheims subscribed for a large share of the bonds, waxes almost tearful in his reproach of his brethren for "placing financial gain above the principles of humanity...thereby aiding and abetting in the nefarious policy of pogrom and massacre."—Chicago *Israelite*. But possibly the reproach is a bit premature. In catching the creditor's whip from the hands of Gentile bankers, the Jews need not necessarily have been moved by any very friendly feelings toward Poland, nor have proved themselves false to their tribe and its program.

Identification of the World Zionist Organization with the International Jewish Banking Combine is no longer a matter of any difficulty. The presiding officer of the Twelfth Zionist Congress, which held a two weeks' session in September at Carlsbad, is Lord Rothschild, head of the great London banking house of M. Rothschild and Son and the central headquarters of the Frankfort, Paris and Vienna "Rothschilds" and their numerous branches and agencies throughout the world. He is assisted in his presidential duties by Professor Otto Warburg, and vice-chairmen, who will conduct special sessions, include Louis Lipsky, secretary of the American Zionist Organization; David Yellin, of Palestine; Professor Pick, of the Mizrachi, and Dr. Arthur Hanke.

In connection with the petition of the Arab deputation now in London to the British Colonial Secretary for the establishment of self-government in Palestine through an elective national assembly in which Christians, Mohammedans and Jews should be represented according to their respective percentage in the population, the Chicago *Israelite* declares: "There seems to be a terrible storm brewing in Palestine and one which will prove disastrous to the Jews unless they are willing and able to meet these demands of the native population fairly and squarely." The Arabs charge that they are being unfairly treated by the present administration, which is entirely under Jewish influence. In conversation with the London correspondent of the Manchester *Guardian*, a member of the Arab delegation said: "We do not object to the Jews, but we do object to the policy of Zionism, which is gradually to obtain a dominant power by immigration and finally to establish a Jewish state. The immigrants who have come are the most objectionable class, including Bolsheviki, and this low-class Jewish labor is displacing Arab workers. In the Parliament we want, the Jews would have as many members as their numbers justify."

Numerous inquiries reach this office asking if there is anything in the book, "The Four Horsemen of the Apocalypse," which shows a monkey searching for lice through the hair of a non-Jewish American soldier, while the other American soldier shown—a Jew—reads a newspaper printed in Yiddish. No! These delicate touches are the contributions of the Jew-owned, Jew-controlled and Jew-degraded motion picture industry of the United States.

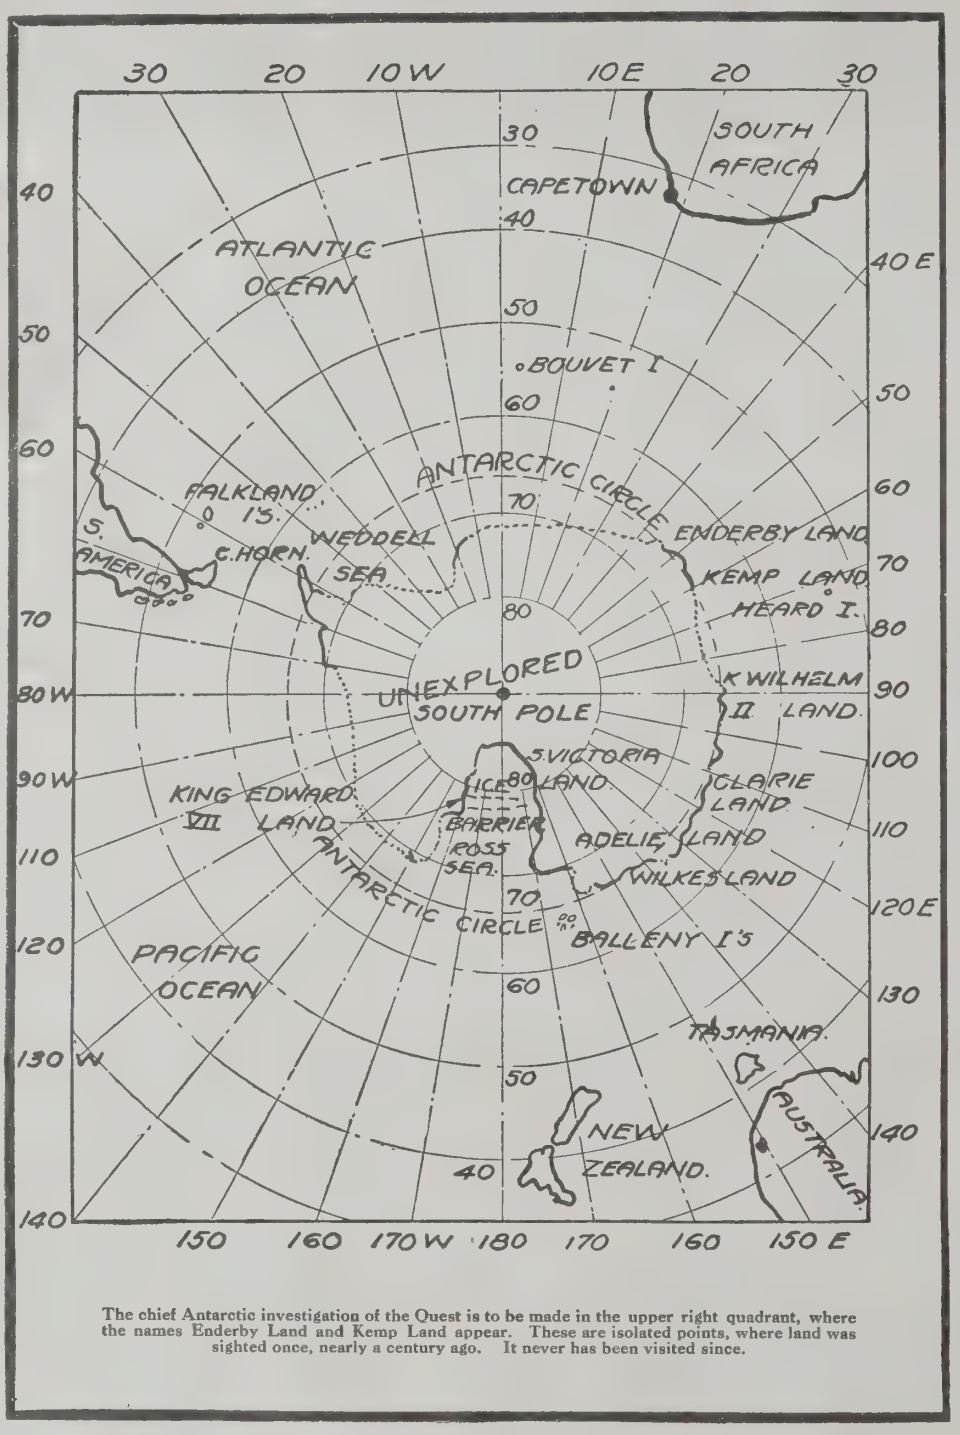
"The great German editor" is the style in which Maximilian Harden is described for his forthcoming lecture tour of the United States. This "German" is a Jew of Polish origin, as were many of the "Germans" whose behavior puzzled the world. "Harden" is a "cover name"; his real Hebraic name is Witkowski.

The Boston *Post* prints the story of "a camp of anarchy" near Steelton, New Jersey, of which it says, "The only flag on the 57-acre plot is the red flag of anarchy." It is only another instance of the increased liberty being taken by American newspapers that the *Post* should add, "There are 175 persons living in the colony, chiefly Russian Jews." Even if that had not been stated, the intelligent reader could have assumed it.

Antarctic Adventure: The Voyage of the Quest

By W. P. CROZIER

Manchester, England—(By Mail).



SIR ERNEST SHACKLETON'S little ship, the Quest, has started on her journey into the South Atlantic, the Pacific and the unknown Antarctic regions. The voyage will take 18 months and cover 30,000 miles. The equipment of the ship itself records the march of science. Just as Captain Scott's last expedition carried motor cars and Sir Douglas Mawson's a wireless telegraphic plant, so Sir Ernest Shackleton has the wireless telephone on ship and will have it at his shore base, with his exploring parties and on the airplane which is aboard the Quest. These are enormous advantages, equivalent to many extra weeks, it may be months, of voyaging. The value of the airplane when the Quest pushes its way into the Antarctic pack ice, hoping to find a passage through to the continental land mass, cannot be overestimated. From the crow's nest the range of vision is at most a dozen miles, from the airplane, on a clear day, some scores. The airman will discover the best and shortest track through the ice fields, where otherwise the ship would only find her way after days of painful labor and endless disappointments, if she found it at all. There is one qualification only: the airplane asks for moderately fair weather, and the Antarctic is not generous in that gift.

The wireless telephone, too, will save time and perhaps life as well. The stories of polar research are full of the hardships and dangers of the exploration parties that set off from the base and meet the infinite attacks of Nature with no means of communicating with the main body of the expedition or of obtaining help. If Captain Scott had had an airplane or wireless telephone or both—for the two go together now—his journey probably would not have ended in its grim tragedy. There are other scientific apparatus of the latest sort on board the Quest, but two things only need be mentioned here: the instruments for investigating air currents by means of captive balloons and machinery for carrying out sounding operations down to a depth of nearly six miles.

The Quest is a small boat to venture into the great southern seas, with their tempests and week-long blizzards and fields of ice and bergs, of which the famous Captain Cook once counted 300 all about him. She is less than 200 tons, in length only 111 feet. But though small she is not frail. She is a Norwegian whaler, built to withstand the shock of the floating ice and the pressure of the pack. Her sides are of solid wood two feet thick—as thick, almost, as those of her much larger predecessor in Antarctic work, the Endurance. But it is wrong in any event to treat smallness as a disadvantage in such work. The small vessel can be handled easily. She can turn in the loose ice and slip through the narrow passages where the big ship misses her chance and is brought to a standstill.

Besides, some of the most famous boats in the history of Antarctic exploration have been as small as, and even smaller than, the little Quest. The Jane, of Leith, in which James Weddell, in 1823, discovered the sea which bears his name (and from which he brought back the Weddell seal) was 160 tons, while the cutter Beaufoy that went with him was only 65. The Belgica, in which sailed both Dr. Cook (afterward famous for his claim to have discovered the North Pole) and Amundsen, who first reached the South Pole, was not more than 250 tons. The Eliza Scott and the Sabrina, both of London, which nearly 100 years ago made history on the fringe of the Antarctic continent, were but 154 and 54 tons each. Size matters less than structure, though it limits rigidly the number of persons who can be carried on the ship. The Quest carries 16 persons, but no crew, properly so-called. There is no room for crew. But of the 16, nine are seafaring men. And for the others, "the scientists will do the stoking," it is said.

It is no doubt because of the absolute lack of spare room that Sir Ernest had to decline to carry two passengers to Tristan da Cunha, the desolate island in the south Atlantic, which lies 2,000 miles from anywhere. About 100 persons live on Tristan, and for many years they have sought a clergyman-schoolmaster who will go and live among them, ministering to their spiritual needs and educating their children. A Mr. Rogers and his wife volunteered for a period of three years, but the admiralty, which used to send a warship to visit the island each year before the war, declined to do so now because the Quest will call there, but the Quest could not find room for Mr. Rogers and his wife. A sad calamity for the little group on that great volcanic rock which stands up starkly hundreds of feet above the Atlantic, while the ocean all about it is three miles or more in depth. The voyage of the Quest exhibits the third stage in the history of the exploration of the Poles. The first stage was that of scientific research, and it ended by bringing explorers within reach of the Poles. Then came the second phase, when the object of each expedition, whether admitted or not, was to obtain the glory of being the first to reach the Pole. Peary attained it in the North, Amundsen in the South. With their achievements the race was over, there were no longer earth-stirring "records" to be won, but now—the third stage—exploration returns to its primary and proper object of increasing the scientific knowledge of the world. That is the object of the Quest, and its pursuit will take two forms.

The chief Antarctic investigation of the Quest is to be made in the upper right quadrant, where the names Enderby Land and Kemp Land appear. These are isolated points, where land was sighted once, nearly a century ago. It never has been visited since.

First, the Quest will visit a number of far-separated, rocky islands in the Atlantic and Pacific. About some of them little is known except that their existence furnishes us with some slight information about the structure of the ocean bed and throws some light on the connection of the continents on either side. It is known, for example, that right down the center of the Atlantic Ocean, from north to south, there stretches a vast submarine ridge, which here and there thrusts gigantic peaks above the water. The ocean along the line of this ridge is only from 9,000 to 10,000 feet deep; on either side of it there is about 18,000 feet of water. This ridge rises steeply to the surface at the Azores, at St. Paul's Rocks (500 miles off the eastern coast of South America), at Ascension Island, and at the group of Tristan da Cunha already named. Away to the south of Tristan lies Gough Island, about which one may search most books in vain for information. Does it also belong to this ridge that runs from north to south or does it mark the point, as some think, where another ridge crosses from west to east—a ridge connecting America and Africa and marking the stage when at some far distant age there was a land ridge between the two great continents? Hundreds of miles away, again, to the south, lying between Cape Horn and the Cape of Good Hope is Bouvet Island, another desolate rock thrown up out of the sea, found long ago by a Frenchman, then lost, though vainly sought for by some of the great explorers, and then once more discovered. What is the significance of Bouvet Island in the structure of the earth and seas? Does the great ridge which we had thought to stop at Tristan, run right south to Bouvet?

By examination of the structure of all these islands and of their animal and vegetable life and by systematic soundings about and between them, Sir Ernest Shackleton hopes to extend our knowledge of the way the world is made. He will visit St. Paul's Rocks, little islets separated by narrow but deep gulfs of water, so that they stand up from the ocean bed like dolomites, occupying in all only 500 yards. Then on to South Trinidad, which stands out in the sea 700 miles east of Brazil, an island four miles long by two broad, the home of petrified trees and of ferocious land crabs. Thence to Gough Island and to Tristan, 16 miles in circumference, and all of it, except for one small stretch, made up of cliffs that tower up sheerly from the water from 1,000 to 2,000 feet into the air. And so to Bouvet Island, on which no man has ever landed. Later, returning from her plunge into the Antarctic, the Quest will visit Heard Island, so named from Captain Heard, of the American ship Oriental, who discovered it in 1853; and this also is ground little, if at all, explored. And lastly, on its pilgrimage of islands, the Quest will search for two, the very existence of which is in doubt. One of them is Dougherty Island, midway between New Zealand and South America, which, if it does exist, Sir Ernest thinks might make a useful British wireless station. The other is Tuanaki, a lost island of the Pacific, mentioned in missionary records as well-wooded and inhabited, but not heard of now for 90 years. What has become of Tuanaki? A shoal is reported now where Tuanaki is reported to have stood. The Quest will dredge over the shoal and come back with a record which will prove whether there was nothing in the missionary stories or whether the well-wooded island sank in a sudden subsidence beneath the waves. The voyage of the Quest has its picturesque side.

It also has a side which is pure Antarctic research. It will explore a part of the great Antarctic continent, about which next to nothing is known, though it is 3,000 miles in length. Look on the map due south of New Zealand and there lies the Ross Sea. This is the region made famous by all recent exploration, for from it Amundsen, Scott and Shackleton set out for the South Pole. Look again, due south of America and there is the Weddell Sea, the character of which is comparatively well known. But look due south of Africa and there is an almost unmarked coast line for some thousands of miles. This is the Enderby quadrant, where, in all the years that have passed, since Captain Cook first crossed the Antarctic circle in 1773, land has only been sighted for a few moments at two points.

For 3,000 miles here and eastward around to the Ross Sea, the coast of the Antarctic continent remains to be tracked out. Only a chain of names, dotted over that great space, marks the points where an explorer, sailing along the Antarctic circle, saw—or thought he saw—the land appear. Farthest north, the first point to be reached by the Quest, will be Enderby Land. It is nearly 100 years since the firm of Enderby Brothers, of London, combined the business of sealing with a keen interest in Antarctic exploration. Their captains shared this fervor, and in 1831 Biscoe saw a point of land to which he gave the name of Cape Ann; the coast he named for his employers. From that day to this nothing more has been seen or known of Enderby Land. A little farther on toward the east is Kemp Land, which commemorates the voyage of another Enderby pioneer. These are the only points of known land in the whole of the vast Enderby quadrant. Farther east, if Shackleton should prolong his search that way, there are others like them, as isolated, as dimly seen by their original discoverers and as long left unexplored. First, is a little spot called Kaiser Wilhelm II Land, the discovery of a German expedition; next, Clarie and Adélie lands, which were so named by the Frenchman, D'Urville; and, stretching for many miles, a vague line dimly noted by the gallant Wilkes, the United States naval captain, who in 1836 set out with ships that were but ill-equipped for their hard task. A little eastward of Wilkes Land, one of the Enderby captains discovered five mountainous islands (named for himself the Balleny islands) with smoke issuing from their peaks. Who knows what strange and interesting discoveries might not be made at points noted as land by Enderby pioneers and by Wilkes and D'Urville.

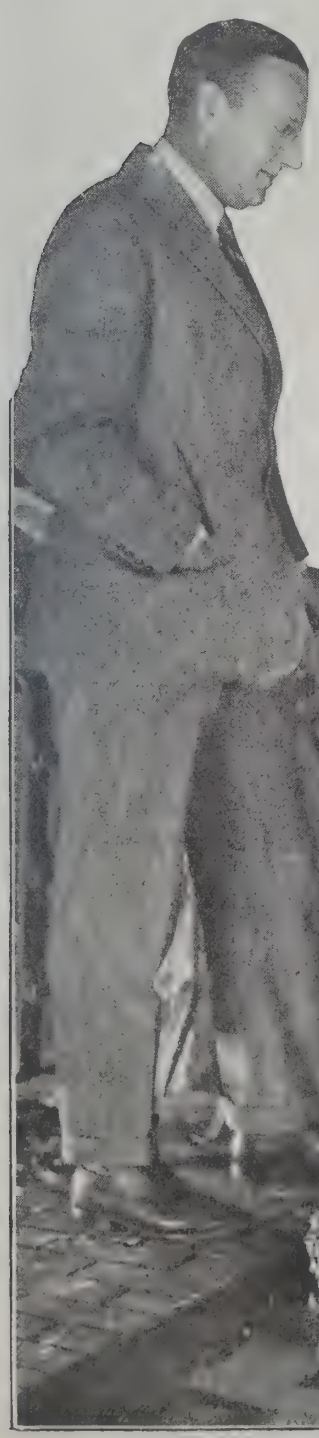
Baring the Heart of Hollywood: The Truth About the Motion Pictures

Growth of Industry, Development of Trust, Owners, Stars, Propaganda, and the Future

ADOLPH ZUKOR,

President Famous Players-Lasky Corporation.

WITHIN eight years the motion picture industry has attained the status of fifth largest industry of the world. Some statisticians have even ranked it as high as third, placing above it only the iron and coal industries.



The United States alone contains 25,000 theaters, of which more than 16,000 are devoted exclusively to motion pictures and some 5,000 to combination pictures and vaudeville.

The investment in these theaters aggregates many hundreds of millions. The investment in motion picture studios also runs into many millions. About 40 of the largest of these studios are in or near Los Angeles. Fifteen or twenty more are in New York and New Jersey.

Eighty-five per cent of all the photoplays made are produced in Southern California. What Detroit is to the automobile industry Los Angeles is to the film industry.

Besides the vast sums invested in theaters and studios, it is estimated that more than $100,000,000 is spent yearly in the making of the big photo-dramas.

Today this vast industry is on the verge of the greatest upheaval in its cyclonic history. The independent producers, the movie actors, the independent exhibitors, the independent distributors, the members of the various labor crafts affiliated with the industry are all running in circles. Those who dare are uttering loud wails of protest, others are dumbly awaiting their fate. The situation reminds one of a tree full of nesting birds in which a serpent has appeared and is leisurely devouring their progeny. The serpent in this instance has been known under many names. It is a devil whose name is legion, a hydra-headed monster; but its center of action is one—and one with the International Power that controls the world's money.

At the time this is written things look very dark for the denizens of the tree. The serpent—to continue the metaphor—is powerful, very powerful. The birds cannot combat it, either singly or as a body. But they have a mighty ally if he can only be aroused; an ally of whom the serpent is ever in deadly fear. This ally is known as Public Opinion—the same force that has slain many such dragons in the past.

If this were merely a struggle between competing elements in the industry, the public would have no interest except as a spectator on the side lines. But the matter goes much deeper than that. It is a question that vitally affects the public itself. The domination, by a Wall Street corporation, of such a medium of public information and molder of public opinion as the motion pictures have become, is a dangerous thing.

Few realize the terrific power wielded by the controllers of the film-screen. Read what Sydney S. Cohen, president of the Motion Picture Theater Owners of America, said in an address to President Harding last May.

"Its language is simple, vivid and direct, because it appeals to the eye, which has been called the immediate channel of the soul; because it impresses with equal force the literate and the illiterate, the motion picture has developed into an agency more powerful than either the printed or the spoken word."

In other words, the motion pictures may become a more powerful engine for the molding of the human mind than our books, newspapers, magazines; a more dynamic influence than the eloquence of preacher or orator. Small wonder that those who would subvert society have gazed with covetous eyes on this tremendous leverage over that public which it affects to despise but secretly fears. That public is like a herd of Texas cattle, in that while under control it can be handled by a few men, but when once stampeded it becomes a menace that terrorizes the stoutest hearted.

But the greatest power of the motion picture, the real secret of the desire to control it, is its internationalism.

The motion picture, by appealing to the eye, and the eye alone, overcomes the great barrier of language and distance that has until now separated the world's peoples. On the screen the little touches of nature that make the whole world kin might be utilized to bring together the inhabitants of the globe into one great family. Insular prejudices and ignorance might be swept aside and the cause of humanity advanced further in the next century than it has been in all the centuries of the past.

This end would be realized if the motion pictures were in the right hands. In the wrong hands they can be and are used as an instrument for sowing discord, hate and warfare. We have seen what they were able to accomplish during the World War in this country. Appeals by public speakers and the press left a large portion of the public unmoved. But the pictured stories of well-staged "atrocities" fanned their indignation to white heat. It is the difference between the recital of a narrative and actually seeing the occurrence.

With this mighty instrument to use as they see fit, the little group of men who dominate the industry today can hold the peace of the world in the hollow of their hands. Who are these men; what are these men; where did they come from and how did they obtain this control? It is only by the past that we can judge their conduct for the future. Without passion or prejudice, the writer will tell the story straightly and simply as it was revealed to him by men who have grown up in the industry.

Jesse L. Lasky, Vice-President of the Famous Players-Lasky Corporation, Elinor Glyn, the writer, and Gloria Swanson, the film star, at Hollywood.

The facts told here are open secrets within the industry. Several of the trade journals catering to the exhibitors have openly made charges based upon these facts and have named names. The charges are at last now matter of investigation by the Federal Trade Commission, and the United States Senate has before it a resolution demanding an inquiry into the alleged movie trust's violation of the Clayton Law.

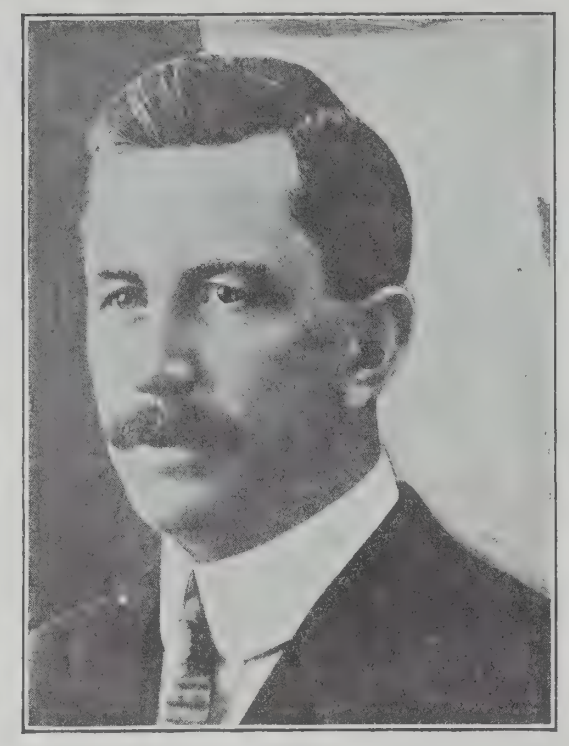
That the reader may understand the present situation in the film industry it is necessary to delve a little into its past history. It has become commonplace to say of motion pictures that they are in their infancy. As an art this is probably true; but as an industry they are grown up. Wall Street has no time for infants. Sometimes a promoter leading his prodigy by the hand may be sandbagged and his child kidnaped by hangers-on lurking in its environs, but the street itself is only concerned with grown-ups.

During the years that the industry was getting on its feet, Wall Street ignored it. It was classed with the theatrical business. It was too much of a gamble for the "sure thing men" who never play without having the cards stacked and the wheel wired.

Even the big Jews in the theatrical business who had succeeded in getting control of the legitimate stage and had already begun their campaign of substituting pretty faces for actors and shapely forms for acting, looked with contempt upon the early development of the screen.

Some of these very Jews, however, are now leaders in the industry, and they got in on the ground floor. They broke in through the penny arcade route; open front storerooms filled with music boxes and peep shows where one deposited a penny and watched a bunch of chorus girls in tights or a couple of prize fighters strike boxing attitudes. They had little idea in those days into what these crude machines would eventually evolve. The ingenuity of Thomas Edison and the genius of David Wark Griffith carried them forward to a fame and fortune of which no one had dreamed.

But it was something besides luck that brought such men as Zukor, Goldfisch (now Goldwyn) and Loew into the dominant positions they now hold in the industry. They had the opportunity and they also had the ability to avail themselves of it, an ability that must not be underestimated.



Fortunes came quickly in those early days of the pictures, especially after Griffith had conceived the idea of making big photoplays for the screen. Previously the pictures had attracted by their novelty, but with the advent of the drama in the films genuine interest was created and a steadily increasing, regular patronage was built up.

It took but little capital to get into the business then. All a producer needed was money to purchase a camera and supplies and he usually could get credit for these. There were no stars drawing bank president's salaries, no directors whose weekly stipend would require a wheelbarrow to convey home, no costly studios representing millions of invested capital. The producer simply took his cameraman and with a dozen or so active young people hunted a location that did not cost him a cent. As soon as his film was completed his

HON. ARTHUR MEIGHEN

T. A. CRERAR

WM. L. MACKENZIE KING

Canada's Unique Election Campaign

Advent of Third Party Gives Contest Odd Twist

By JOHN R. BONE

WHO will be Prime Minister of Canada after the general elections to be held in the first week of December?

Will it be Mr. Meighen, the incumbent, or Mackenzie King, Laurier's successor, or "Tom" Crerar, the Farmers' leader? It may be any one of the three, for the emblem of this year's contest might be a clover leaf or an equilateral triangle or any design that denotes a tripartite symmetry. Never has there been such uncertainty as to the outcome of an election in Canada, where hitherto electors have been prone to take their politics, like their whisky, straight, and the modifying influences of third parties have been unknown. But the reciprocity election of 1911, followed by issues raised by the war, and the death of Laurier, were to the Liberal party a series of catastrophes that have left it but a semblance of its former self; the old Conservative party, from a variety of reasons, disintegrated, leaving behind a chrysalis from which has emerged a butterfly with an imposing name, the National Liberal and Conservative party, but with wings as yet undeveloped, and meantime, out of the disorganization and confusion, has risen a young giant, menacing in form, but untested as to strength, bearing the name of its class, the Farmers.

The Farmers, or Progressives, are not merely an offshoot of the Liberals, as Roosevelt's Progressives were of the Republicans. They represent a movement all their own and have undermined positions held by each of the old contestants without discrimination. For the moment the two-party system in Canada has vanished. After the election there may be a new alignment which will result eventually, if not at once, in the two-party system's restoration. But that event is in the lap of the gods.

It is not even certain that either Meighen or King or Crerar will be the next Prime Minister, for in the readjustment or making of alliances that may be necessary to carry on government, it is just possible that some new leader may have to be brought in to make co-operation possible. The titular leaders, however, have the advantage of position.

All Three Called Too Serious

UNTIL the present juncture Canada's premiers always have been veterans, even on their accession to office. But in the year of grace, 1921, youth will be served. Mr. Meighen is 46; Mr. King is 46; Mr. Crerar is 45. All three are Presbyterians. All three are clean-cut Canadians, earnest, sincere, actuated by high motives. If they have a fault in common it is that they are too serious.

Meighen and Crerar were born in near-by Ontario townships. Both went West and grew up with the same Manitoba town, Portage La Prairie. Meighen and King were fellow undergraduates at the University of Toronto. Crerar also is a university man. The three have much in their outlook that is common to all.

The outstanding personal characteristics of Mr. Meighen are his courage, perseverance and indomitable industry.

Arthur was raised on the farm and is a graduate from the school of barnyard chores with postgraduate degrees, earned in summer vacations from college in haymaking, harvesting and all the rest of it, though the modern farmer, with his advanced political creed, recognizes him not. After college Meighen taught school and studied law, hung out his shingle in Portage La Prairie, plunged into politics, raising the Conservative flag in the sea of western radicalism, and found himself in Parliament and in the cabinet before contemporaries had found their bearings.

It is said that on Borden's retirement Meighen was a second choice successor. It also is said that there are today grumblers in the ranks of his party. But the chances are that though his defeat in December seems inevitable, he will be the dominating influence in the Conservative party and a potent factor in Canadian affairs for 20 years to come. In his short term as Premier he has been prevented from exhibiting initiative by his disintegrating support and his enforced absence for a considerable period to attend an imperial conference in London. And it is curious that the chief impress he has made on Canadian policies has been in foreign affairs, a field where critics said he would flounder. In London the youthful premier from Canada made a distinct impression. It was largely his courage that initiated the beginning of the end of the Anglo-Japanese treaty, and insured Mr. Harding's success in launching the Washington Conference.

He Knows Labor Issues

WILLIAM LYON MACKENZIE KING, to give him his full name, entered politics through the civil service, and his early career was therefore more sheltered than that of the politician who only reaches the top through the rough and tumble of ward politics.

King's specialty is labor. As a postgraduate student in Chicago he became interested in Jane Addams' work at Hull House. On his return to Toronto he investigated, in connection with temporary work as a newspaper reporter, sweating conditions in clothing shops that were working on government contracts. He laid the facts before Sir William Mulock, then a cabinet minister, who was horrified. That was the origin of Canada's Fair Wage Law. Since then sweating conditions in connection with the labor on any government contract has been legally impossible. It also was the origin of King's career. He became almost immediately the first deputy minister in Canada's Department of Labor. Here he did much constructive work. The Lemieux Act, an advanced piece of legislation, which has had far-reaching effects in preventing strikes on public utilities, was largely, if not entirely, his product.

Laurier took him out of the civil service directly into his cabinet, selecting him, it was said, as a potential future premier. In the government's downfall in 1911 King lost his position, and also his seat, and having abandoned the civil service, had no profession or calling to fall back on. But shortly he was engaged by John D. Rockefeller as one of the directors of the Rockefeller Foundation, with special jurisdiction on matters of industrial relations, a position he held almost up to the time he was selected by the Liberal party to succeed Laurier.

King is recognized as a world authority on labor and industrial issues.

Gaze now on Thomas Alexander Crerar, leader of the revolutionists in Canadian politics, the new third party, alternately described as Farmers and Progressives. He is a product of the West. There is not the slightest awkwardness about his six feet of massive manhood. His clothes are immaculate, his manner courteous, one might say polished, his form of speech noticeably correct. Meighen and King, the old line party leaders, are relatively poor men; Crerar, the "radical," is the president of a corporation with $5,000,000 paid up capital and reserves.

Like King, Crerar was obliged to serve no political apprenticeship on a parliamentary back bench. When he came to the House of Commons he came as a cabinet minister. As a "win the war" leader of the western Farmers, he went to Ottawa in 1917 to enter Borden's Union Government. Indeed it was he, more than any other individual, who made the Union possible, for if Crerar and the Farmers had opposed, the government could scarcely have survived till the end of the war. But Crerar was the first to step out of the Union as soon as the war was over and differences on domestic issues could no longer be composed.

Friends say that Crerar has no taste for public life and that if he is obliged to take ministerial rank again, or even the premiership, it will be against his will.

When Crerar as a child went West, it was to live on a homestead that was 40 miles from a post office and 170 miles from a railway station. He, therefore, knows his West. He taught school to relieve the family exchequer for his college course, but as soon as he was through the university he returned to farming, in which his father was already successful.

So much for the men. Now what are they fighting about?

According to Mr. Meighen the tariff is the issue. He is uncompromisingly a protectionist, and the issue, he says, is between protection and prosperity on the one side, and free trade and ruin on the other.

It is the boast of protectionists that whenever there has been a clear-cut issue on the tariff in Canada, the protectionists have always won. It is, therefore, not surprising to find the Liberals and even the Farmers declining to take up Mr. Meighen's gauge of battle. Perhaps if it had not been for the Fordney tariff now in effect against Canada, they might have entered the lists once more boldly bearing the banner of free trade or at least, freer trade. But there is so much loss and resentment caused by the new American tariff barrier, that such a course would be dangerous. We have, therefore, Mr. King declaring that the tariff is only a minor issue in this election and even the Farmers are singing low on that topic.

The Dominating Factors

BEFORE the campaign closes Mr. Meighen may be able to make protection the paramount issue, but in the meantime the dominating factors are not Mr. Meighen's defense of the customs barrier, or what the Liberal and Farmer conventions said about free trade a year or two or three years ago, but they are:

1. The unyielding hostility of the province of Quebec to the Meighen Government, chiefly because of its war record,

2. The disorganization of the Conservative party throughout the country,

3. The new class consciousness of the Farmers based on tariff and other controversies of the past.

As a result of these conditions the province of Quebec is expected to send an almost solid block to support Mackenzie King, regardless of its convictions in the tariff. The western prairie provinces are expected to send an almost solid block of farmers, with substantial reinforcements from elsewhere. These two circumstances, alone, if realized, seal the fate of the Meighen Government. No government can carry on with a solidly hostile Quebec and a solidly hostile West. Ontario is the great battle ground. If Mackenzie King could sweep Ontario he could, with Quebec, form a government. If Crerar could sweep Ontario, he could, with the West, form a government. But the fact is that Ontario, the home of protection, is likely to give Meighen the majority of its seats and so the prospect is for a three-cornered deadlock.

The government will, of course, have to be carried on, and after the election is over some kind of an alliance between two of the three groups may develop, which will result in a stable administration.

But for many reasons the coming months promise to be the most interesting in the record of Canadian affairs.

What America's Burbank of the Soil Is Doing

By ROBERT H. MOULTON

FORTY-FIVE years ago in a little country schoolhouse in the backwoods of Michigan, a teacher gave a pupil this motto:

"My boy, each morning, when you start to work, hold up your right hand and say: 'This day I will beat my own record—I will put the best I have into this day's work.'"

We little know how our words may affect the lives of others. But the teacher in the Michigan woods gave to America a missionary, a teacher, a preacher, a philosopher, and a prophet, for the boy applied the motto and today he is preaching it to the men and women, the boys and girls on the farms and in the towns and cities of the United States. This man is Perry G. Holden, who is credited with having done more to set agricultural America to moving, and moving in the right direction, than any other single person. He has been described as the Burbank of the soil—the man who set King Corn on the throne and crowned Alfalfa queen.

Not so many years ago Professor Holden trebled the value of the corn crop in Iowa. A little later he put millions of dollars into the pockets of the farmers of Oregon, Washington and Iowa. As a final achievement, his teachings induced the farmers of Arkansas to adopt a system of crop diversification which resulted in an increase of the wealth of the state of more than $30,000,000 in a single year.

And Professor Holden says he has only started; that it is his ambition to do as much, or more, for every state in the Union, and the chances are he will accomplish his purpose, for he is today the leader in a movement for agricultural revival and rural uplift which, in its scope and significance, is without parallel in this or any other country. What is of equal importance, he is at the head of an organization with virtually unlimited facilities for carrying on the work. During the last few years he and his assistants have co-operated in organizing and conducting 60 campaigns for agricultural education, have spoken at nearly 50,000 meetings, and to meet these engagements have traveled approximately 3,000,000 miles by railroad and more than 1,000,000 miles by automobile, while their activities have reached the enormous total of more than 20,000,000 persons.

It was while professor of agronomy at the University of Illinois, from 1897 to 1901, that Professor Holden's work first attracted attention. He looked on corn culture as a source of prosperity and happiness to humanity. He had a vision of more generous fields, more golden harvests. He pictured big red barns, fine dairy cattle, happy homes.

But he beheld these things as possible only through the united efforts and intelligent co-operation of the people and organized the Corn Growers' Association. He recognized the agricultural possibilities of the sugar beet, and the Sugar Beet Growers' Association came into being.

Already he had done much for the farmers of Illinois, but he was not content. He saw the need of improving the quality of the corn and organized both the Corn Breeders' Association and America's first corn judging school. He placed corn on a higher educational plane than Latin and Greek, organized the Illinois club for the dissemination of agricultural knowledge among young men, and revived and broadened the farmers' institutes of the state.

Above—Professor Holden addressing a typical crowd of farmers. Center—School children greeting Professor Holden. Below—Farmers at a "better farming" meeting jotting notes down for future reference.

Then the Iowa State College beckoned him. As professor of agronomy and as director of the agricultural extension department of that institution, he continued the work he began in Illinois. He did more. He "beat his own record."

He inaugurated a better corn campaign that is unique and majestic in the history of agriculture. He shattered all traditions of extension work by refusing to rely on bulletins and other printed matter to carry his message to the people. He went in person to the farmers at their homes and taught them by word of mouth. He inoculated commerce and transportation with the bacteria of more and better corn, and set a precedent for every state of the Union by conducting the first railway train ever run for spreading the gospel of profitable farming.

Other men had treated corn culture as an obtuse science; Holden taught it in the terms of the people, and he taught it whenever and wherever he could. He talked corn to the farmers at their institutes. He attended their grange meetings and conventions and urged care in the selection and storing of seed corn. "Test, don't guess," was his slogan.

To the farmers of Iowa, Professor Holden taught in terms of their own fields. He did not urge doubling or trebling the yield. Possibilities must dawn slowly. He impressed on them the advantages of even a slight improvement, knowing that the greater improvement would follow.

"Add what would equal a three-ounce nubbin to a hill," he said, "and the gain will be 10 bushels to the acre. About 9,000,000 acres are planted to corn in Iowa. That one little nubbin more in each hill will mean an increase of 90,000,000 bushels."

In 1912, after Holden had talked and demonstrated and labored for 10 years, the nubbin was added to the hill. The corn yield in Iowa that year showed an increase of 10½ bushels to the acre, or a total of 122,147,000 bushels over what it was in 1902. In 1912, the farmers of Iowa planted 9,420,434 acres to corn. The total increase in the yield was 98,914,557 bushels, which at 36 cents, the average price of corn that year, meant that the market value of this yield increase was $35,609,240.

Holden became a prominent figure in national progress. There were those who believed that his activities should not be confined to even one nation, so he was offered and accepted the position of director of the agricultural extension department of one of America's leading industrial concerns, organized for world-wide teaching of agriculture. After a period of great work in Illinois, and even better work in Iowa, Holden entered on the world's work.

But first there was more work to be done at home. Professor Holden had long known that the agricultural problem of the Northwest was the one-crop system. Great tracts of land had been seeded to wheat year after year until the soil was becoming worn out—robbed of the elements necessary for the growth of plant life. He decided at once that the remedy was the growing of alfalfa, that wonderful plant, which is not only a money-making crop in itself, but possesses the magic power of putting nitrogen and organic matter into the soil. Thereupon Professor Holden organized the Inland Empire Alfalfa Campaign, and in co-operation with six great railroad systems of the Northwest, began the campaign for alfalfa on every farm.

While the agricultural demonstration train inaugurated by Professor Holden in Iowa was a mighty step forward, he believed there was a still better way of reaching the farmers. At last he hit on it: the automobile in conjunction with the railroad train. The farmer could come to the towns where the train stopped, and thousands of them did, but in many instances this meant a long trip. The thing to do, then, was to go to the farmer, to meet him in the fields, on his own threshold, or wherever it was most convenient for him to go. It was planned, therefore, that at every place where the train stopped automobiles should meet it and carry the speakers to prearranged meeting places; in schoolhouses, churches, town halls, theaters, barns, out in the open fields, or by the roadside.

On reaching a designated stopping place, the Alfalfa Special, with its corps of experts, was met on scheduled time with automobiles and from 10 to 20 speakers, with charts, samples and literature and whirled away to as many meeting places in the country, while one or two speakers remained for a central meeting in the town itself. Here was something new. There had been Corn Specials, Soil Specials, Dairy Specials and the like, in other days, but the combined auto-train Alfalfa Special, with its speakers who went to the people instead of the people coming to the speakers, was a revelation.

When a meeting was held in an alfalfa field there was no question of its success, as many good lessons were easily driven home by illustrations from the growing crop. The speakers used huge charts which told some most interesting stories in a manner that was indisputable.

One of Professor Holden's strong points was that alfalfa will act as a land reclaimer. He declared that once it is given a chance it will refuse to be kept off of land that is now considered practically valueless. Alfalfa is known to put back into the soil what other crops take out. By a peculiar process, the nodules that form on the roots extract nitrogen from the air and deposit it in the soil. And nitrogen is what other crops need.

Even the school children got their lesson from this campaign; not only a lesson on alfalfa, but on history and geographical subjects. But, underlying every talk, whether it was to the boys and girls, or to the men and women who had grown old on the farm, there was the same lesson to be learned: "Fertilize the soil with brains."

The result of this campaign was that more than 200,000 acres of land in the Inland Empire, never before in any kind of grass crops, were put into alfalfa the following year. Thousands of farms which had been deserted by their owners because of the soil, worn out by constant planting to one crop, did not yield returns of any sort, were reclaimed, rejuvenated.

Having accomplished so much for the people of the Northwest, Professor Holden turned his eyes to the South. Arkansas immediately invited his attention. The need here was similar to that of the Inland Empire—crop diversification. The farmers of Arkansas had been growing cotton for nearly 40 years—growing it to sell for money to buy food for man and animal. The practice of this system had placed the state at the mercy of the North and East, both in buying and selling. The cotton crop was sold in 1913 for $63,000,000. This amount and $12,000,000 more was sent out of the state to buy foodstuffs which should have been produced on the Arkansas farms.

Professor Holden realized that it would be a tremendous undertaking to change a one-crop system of 40 years' standing to a safe system of agriculture whereby the farmers of an entire state might be induced to raise their own food and feed and thus make cotton a cash crop. But he entered on the work with enthusiasm.

With a staff of 60 men, the campaign was begun November 10, 1914, and carried on for 35 days, approximately 1,400 meetings being held in 49 different counties, covering the entire cotton belt of the state. The speakers pointed out to the farmer the folly of buying food and paying a big profit to some one else, when he could raise that food at home and save this big profit.

According to the Little Rock Chamber of Commerce, this campaign added $30,744,150 to the value of the agricultural products of Arkansas.

Thus one by one the states of the Union are being covered by Professor Holden and his army of expert talent, the campaigns in each instance being pertinent to the direct needs of the people.

How to Understand the Armament Conference

Existing Land Forces Sanctioned by Allies Total Nearly Ten Million; Limitation of Naval Armament Must Also See Militarism Repudiated

By A. R. PINCI

EXCEPTING the League of Nations, the conference to be held at Washington on the subject of limitation of armament, popularly and logically understood as disarmament, has been preceded by the greatest possible amount of universal publicity ever given upon any one problem at any one time. Publicity and explanation, however, are not always related, especially where statesmanship is concerned.

To understand the purposes and practicability of the conference it is best to regard it for what it is rather than for what one would like it to be. Because it is based upon inherent humanitarian principles is no reason to make sentimentalism the quality of one's beliefs. Political or diplomatic bias serves to distort the outlook.

Forecasts are dangerous as they are inconclusive. Reports oscillate between inevitability of success and that of failure. Of course, they are qualified but on the whole they are too involved. Making all allowance, it is very difficult to reduce theories to facts, and the only safe thing to do is to analyze the facts upon which the theories are based.

Disarmament offers a peculiar problem in compound psychology. When the people clamor for relief from taxes, reduction of armament is the first thought; but let them be told that such a step would mean national suicide, then their respective statesmen score a victory. The latter is a phase of patriotism which is very useful to militaristic administrations, because it facilitates their practices.

Quibbling Will Mean Bad Faith

DOUBT arises as to how sincere is the policy of big armament and how great its necessity. Circumstances vary with nations, and future contingencies cannot be predicted with certainty, but it will remain forever and ever an unanswered question as to just what is the responsibility of statesmen between theory and fact in national safety. Is it possible that every country is constantly menaced by every other country? If it is possible, is attack probable? For this is the fear that consumes every government official of whatever race, creed or color.

How much of this common and habitual fear is fact and how much of it is delusion? It never happens that a group of citizens of different nationalities, not specifically out to bluster, fail to get along amicably; but those very same citizens, once vested with the authority of government will not hesitate to commit their peoples to war in the name of patriotic duty. Unless it is possible to eradicate this dangerous official frame of mind, which is the corner stone of professional diplomacy, disarmament will remain an unsolved problem.

To begin with, Washington is iterating the warning that the conference is on "limitation of armament" and not on "disarmament." There is a technical difference, but otherwise it is mere apologetic quibbling. And the people represented at the conference will regard quibbling as the soul of bad faith. There can be no delimitation policy without the corresponding intention to disarm.

Disarmament, therefore, is the more proper term, even though it has a drastic, harsh sound to which diplomacy's ear refuses to be attuned. It is essential, at the very outset, to determine whether armament, as a problem before the conference, will mean navies, armies, man-power or industrial wealth. Armament today implies somewhat more than men and guns. It really means the intensified scientific force of a country. Can this force, so useful to the world in its normal pursuits, be diminished just because another country is less well endowed with internal resources? An example of how this distinction operates will be set forth, so that one who understands that understands practically all that there is to the problem. The United States, for instance, hardly justified the prophecy that a million men would be ready overnight for defense, but nevertheless in 18 months we demonstrated several industrial and scientific miracles. There is no limit to the number of times this metamorphosis can be undergone. Governments do not disregard its possibilities. France will consider reducing her armed forces only if assured of a "protective" alliance with us, which in reality means guaranteeing her the benefit of this country's combined forces, actual and potential.

United States the Strongest Nation

ALTHOUGH the spokesmen of the delegations will hardly risk making such a statement, it can be taken for granted that the United States will be considered by foreign conferees as the world's most powerful nation, despite its non-militaristic character. England, France and Japan, as the chief armed nations, count what they have in the way of warships and soldiers and what they do not have of internal resources and, practically disregarding American military power, will base their attitude on what this country possesses of frontier-protected internal resources. There are experts who hold that this American force exceeds all foreign artificial protection. At this juncture fact ceases and theory enters; it is the question of good or bad intentions, already alluded to, with the diplomats to control its effect upon the public mind.

The official view is born of recent experience. If Mother Nature is not prodigal, the nation seeks to protect itself otherwise, which means armed resistance. A proposal, which has been advanced by responsible public men, that this country would be ready to set aside a given tonnage of warships and other related quantities of military equipment, together with identical contributions by other powers, to sink the whole in the Atlantic Ocean, would be simplicity itself, since it would reduce totals without affecting the existing order, but it is not acceptable abroad for the reasons stated. It is futile for American officials to discuss disarmament with foreign statesmen in terms of warships and soldiers; they regard the United States with awe after the showing that was made in 1917 and 1918.

Mention must be made, also, of the suggestion of a co-operative international navy, because its possibilities probably will be discussed by the conferees. Fundamentally such a composite navy should be feasible, but what super-authority would control it? It revives somewhat the theory of the League of Nations, whose friends claim it to be the natural instrument for disarmament. The League, unfortunately, has no mandatory powers, and it cannot compel any member to discard a single torpedo boat or throw away even a rusty bayonet.

In so far as the object of the conference at Washington duplicates the League of Nations, either as to ideals, motives, intentions or results, it cannot surpass the League, either toward success or failure.

In the popular phraseology of the day there is a saying that the United States must or should or will—as the case may be—"lead" all other nations. It is a phrase that may be found in every newspaper and the *Congressional Record*. It is a treacherous phrase. Statesmen and capitalists with the object of industrial greatness, divines and some editors in the name of supreme altruism, politicians and propagandists for the sake of beguiling the multitudes—together they invoke that exortation which is read abroad as a continual challenge, until the average foreigner is convinced that Americans who now have everything are minded to obstruct the progress of their nations.

Our foreign friends, and not a few antagonists, ask why the United States does not "lead" in disarmament. The question, of course, is reasonable enough, from their standpoint. But can the United States lead? And if it can, will Europe and Japan follow?

Several years ago, this same question was agitated. Once I submitted it to the late Admiral George Dewey. He said that the United States did not set a naval pace but had to follow the pace set by others. Just where following said pace ends and setting said pace begins is something about which few minds seem to agree.

Conference preliminaries have stressed the need of naval reduction, and the net result has been to draw public attention away from the very ominous military situation.

The Armies of Nations

THE latest available figures show that there are 9,348,131 soldiers in the world's armies, or about 19 soldiers to every sailor! The world's combined naval personnel is estimated at 497,000 men. When it is remembered that the opportunities of navy men to start trouble that leads to war are very rare, one may form an idea of what so many soldiers scattered about in this world can bring about.

Russia and China lead in numbers, the former with her mysterious Bolshevik organization approximating 1,500,000 men, and the latter with a force of 1,369,000 soldiers; but neither of these national forces may be considered armies in the fullest sense of the term. Nineteen Latin-American republics, Panama not included, have a net total of 429,547 soldiers, which somehow gives the impression that the lauded Pan-American unity is far from being a reality. Ominous indeed, however, is the showing made by the Slavic countries, not including Russia, which have 1,981,164 soldiers scattered from the Adriatic Sea all the way to the White Sea. As that territory represents the seat of about all of the great military troubles of the last century, culminating with the Great War, the situation is not encouraging. The League of Nations, which has had the power to decrease armies to the bone and has supposedly done so, has nevertheless authorized aggregate land forces that compare unfavorably with those anteceding the war.

Germany has been reduced to the required total of 50,000 soldiers; but for some inexplicable reason Poland to the east and France to the west have each been permitted to build up huge peace armies, with both absolutely unwilling to consider any thorough reduction. Collaterally Austria, with about 30,000 men, is between Jugo-Slavia with 200,000 men and Rumania with 250,000. One marvels at these totals, but more so one may marvel at the amiability with which statesmen enforcing the terms of the various peace treaties suspend those terms which Balkanic countries find unsatisfactory.

With regard to naval armament, only the navies of the seven leading powers are important enough to warrant consideration. The total tonnage of warships of every description is 5,551,813, divided as follows: England, 2,617,327; United States, 1,167,586; Japan, 606,262; France, 502,933; Italy, 286,671; Russia (condition unknown) 254,148; Germany, 116,886. Their combined personnel is 430,000 officers and men.

It is evident that countries are divisible into two distinct groups—naval and military, and each makes up in preponderance of one arm or the other so balanced as to give the highest degree of required protection. Under the circumstances armament is not susceptible of land or water distinction, not at least as the objective of the conference. For one power to be disposed to discuss only the other fellow's strength is beating about the bush. This should be understood in its fullest significance—*that the powers are endeavoring to consider the limitation conference as an equalization conference.* The only way to guard against this tendency is by putting delegates on record, and that means unstinted publicity.

One hears much about the "menace of Germany." Whatever unsatisfactory militaristic condition exists is laid to Germany. Germany counts no more; her complete disarmament has been announced. "There is not the slightest apprehension of the possibility of Germany being able," it was officially announced in London late in September, "to organize and equip an army of such size as to constitute any danger to the Allies. There are, of course, plenty of men, but they are lacking all necessary armament and equipment."

Despite this pronouncement, and that Germany has practically been restricted to its maximum military force of 50,000, France still remains dissatisfied. Although no French official would risk making such a statement officially, or in so many words, it seems that so long as German man-power is greater than France's, France cannot feel "safe."

France will participate in the conference, bearing in mind that the Senate of the United States not only rejected the League of Nations, a matter about which the French cared nothing, but that it also rejected the promised protective alliance with this country. But was the comfort of this protection, so much desired by French statesmen, essentially against Germany? Yes, is the popular idea. No, is the diplomatic secret; there is a more serious intention.

France Wouldn't Efface Itself

AS A matter of fact, France's entire policy since the armistice has been directed toward the possibility of disturbed Anglo-French relations. Prognosticators of broken relations have been many, but discounting sensational reports, it cannot be denied that England and France are not in very hearty accord. As soon as Mr. Austen Chamberlain, the government leader, found it necessary to make an announcement in the House of Commons denying the intention of a separate Anglo-French alliance, French statesmen openly took issue with England. As a result Franco-British relations will never again be what they were prior to 1921. France lost the only opportunity to weld itself with England, because it depended upon France's self-effacement.

England, of course, although concealing the purpose to save the feelings of her war associates, has favored a policy whose effect is to revive industrial Germany, with an eye to Russia because without these two countries, the latter rich in raw materials which Germany can transmute into finished products which England intends selling to the world, England cannot retain its supremacy. It is essential to follow the meaning of these individual nationalistic European contentions to realize how vital they become and how they can and will influence all disarmament discussions.

England and Her Navy

ENGLAND, after the United States, really favors a limited armament policy, provided, however, that all advantages accruing by reason of her present naval supremacy will not be diminished in any respect. But it is well to see just what the British Navy means, and how far England can, in view of the outlook, restrict its growth. Her navy has become a sort of inseparable corner stone of the whole Britannic colonial superstructure. In itself that navy has never been regarded as a menace, because, so long as things remain as they are, the spirit of England is progressively industrial.

Strategically, England could wage a naval battle against any potential antagonist if she could rely on the undivided support of the dominions. This support is indeed problematical; pending the identity of the enemy it will remain doubtful. It is a mistake to point to the fidelity of the dominions during the recent war because that support was due to self-protection against Germany's colonial aspirations.

England has a mastodontic navy either to protect or to hold her dominions. Certainly there are no indications whatsoever that these dominions, separately or together, will be in danger of hostile annexation. With no enemy in sight, England does not require her extravagant fleet to protect. Upon this premise, then, the conference might, if in earnest, suggest reduction.

But would England entertain it? The question answers itself. There is fear of contraction from *within*, and the navy is in consonance with growing maturity and accompanying indication of sovereign independence of the powerful dominions. How far England will sacrifice so much of power for the sake of the hoped-for limitation as against the fear of loss by dismemberment cannot be doubted.

The weight of attack for a vacillating attitude toward the conference has been toward Japan, which

returns were immediate. Money literally poured in on him. The industry financed itself.

At the time Griffith was beginning to prove that there was a real field for drama on the screen, the big money was in prize fight films. The boxers soon discovered this also and presently the picture rights became even more valuable than the purse at stake. Then certain states began to pass laws against the showing of fight pictures and a lucrative source of revenue was cut off from the promoters.
